7. Install the dowel pins after completing the idle mixture adjustment. Use care not to disturb the mixture screw positions. It is necessary to remove the carburetor to gain access to the dowel pin locations. After the carburetor has been reinstalled, again check the idle speed specifications and correct as required.

5.9L Engine with 2150 Carburetor

NOTE: The idle mixture adjustment screws are concealed by tamper resistant caps. The idle mixture should be adjusted only if the mixture adjustment screws were removed or altered during major carburetor overhaul or tampering.

1. Connect a tachometer to the engine.

2. Start the engine and allow it to reach normal operating temperature.

3. Set the parking brake and chock the wheels. Position the automatic transmission in D.

4. Be sure choke is completely off and the idle speed is set to specifications.

5. Turn the idle mixture adjusting screws clockwise (leaner) until a perceptible loss of engine speed is noted on the tachometer.

6. Turn the idle mixture adjusting screws counterclockwise (richer) until the highest engine speed is obtained.

7. This position of the idle mixture adjusting screws is referred to as the lean best idle.

8. Turn both idle mixture adjusting screws clockwise in small, equal

Carburetor mounting and connections

Carburetor adjustment screw locations

amounts until the specified idle speed drop is noted on the tachometer.

SERVICE ADJUSTMENTS

For all carburetor service adjustment procedures and specifications, please refer to "Carburetor Service" in the Unit Repair section.

Fuel Injection

IDLE SPEED AND MIXTURE ADJUSTMENT

Idle speed and mixture adjustment are controlled by the ECU and are not adjustable.

Throttle body fuel injector components

Fuel Injector

REMOVAL & INSTALLATION

Throttle Body Injection

1. Disconnect the negative battery cable. Remove the air cleaner and hose assembly. Relieve the fuel system pressure as necessary.

2. Remove the throttle body upper and lower covers.

3. Remove the fuel injector wire by compressing the tabs and pulling it upwards.

4. Remove the fuel injector retainer clip screws. Remove the fuel injector retainer clip.

NOTE: The injector has a small locating tab that fits into a slot in the bottom of the injector bore of the throttle body. Do not twist the injector during removal.

5. Using a small pair of pliers, gently grasp the center collar of the injector, between the electrical terminals, and carefully remove the injector using a lifting-rocking motion.

6. Discard the centering ring and the upper and lower O-rings. Never reuse these rings!

7. Installation is the reverse of the removal procedure. Lubricate both O-rings with light oil before installation.

Align the tab on the injector with the slot in the throttle body.

Multi-Port Fuel Injection

1. Disconnect the negative battery cable. Relieve fuel system pressure.

2. Disconnect the fuel lines at the ends of the fuel rail assembly.

3. Mark and disconnect the injector wire harness connectors.

4. Remove the fuel rail retaining bolts.

5. Disconnect the vacuum line from the fuel pressure regulator.

6. Remove the fuel rail assembly from the engine.

NOTE: On models with automatic transmission, it may be necessary to remove the automatic transmission throttle pressure cable and bracket to remove the fuel rail assembly.

7. Remove the clips that retain the injectors to the fuel rail and remove the injectors. An O-ring kit is available which consists of 6 brown seals and 7 black seals. The brown seals fit on the injector tip area and seal the injector to the intake manifold. The black seals fit on the rail end of the injector to seal the injector when it is installed into the fuel rail. The last black seal is for the fuel pressure regulator to seal

the pressure regulator to the fuel rail. These seals cannot be interchanged.

8. Installation is the reverse of removal. Tighten the fuel rail mounting bolts to 20 ft. lbs. (27 Nm).

DIESEL FUEL SYSTEM

Fuel Filter

REPLACEMENT

1. Attach a long piece of flexible tubing to the filter drain cock.

2. Run the tubing to a suitable container, open the filter vent valve and open the drain cock.

3. Drain the filter completely and remove the retaining clips. Discard the filter.

4. Install the new filter into the retaining clips.

5. Run the engine and check for leaks.

Draining Water From the System

The water in the diesel fuel system must be drained during servicing. The water can be drained by placing a container under the drain valve and opening the valve. Allow fuel to drain out until it is uniform in color and no water is mixed with it.

Diesel Injection Pump

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Using heavy clamps, clamp off the coolant inlet and outlet hoses at the cold start capsule, disconnect them from the capsule.

3. Disconnect the throttle cable and fuel shut-off solenoid wire.

4. If so equipped, disconnect the automatic transmission throttle cable, and cruise control cable.

5. Disconnect and plug the fuel delivery and return hoses.

6. Remove the alternator drive belt.

7. Remove the power steering drive belt.

8. Remove the timing belt cover.

9. Rotate the crankshaft clockwise, as viewed from the front, until No. 1 piston is at TDC compression. Make sure that the camshaft sprocket timing mark is aligned with the center boss on the cylinder head cover. Make sure, also, that the injection pump sprocket timing mark is aligned with

Fuel rail assembly location and mounting—4.0L engine

Diesel injection pump

the center of the boss on the injection pump.

10. Rotate the crankshaft counter-clockwise, moving the sprocket timing marks by 3 timing belt teeth.

11. Install sprocket holding tool MOT-854, or equivalent. It may be necessary to turn the sprocket back and forth slightly to install the tool.

12. Loosen the sprocket retaining nut on the end of the injection pump shaft, and turn it out just to the end of the threads.

13. Assemble the appropriate sprocket removal tool.

14. Attach the tool to the injection pump sprocket.

15. Disconnect all the fuel pipe fittings from the injectors. Plug the in-

jectors to prevent dirt from entering the fuel system.

16. Disconnect the fuel pipe fittings from the fuel injection pump. Plug the fittings to prevent dirt from entering the system.

17. Remove the fuel line fittings from the vehicle. Remove all hoses and connectors from the injection pump assembly.

18. Remove the injection pump rear bracket retaining nuts.

19. Remove the plastic shield from under the injection pump.

20. Remove the 3 retaining nuts located at the front of the injection pump. It may be necessary to remove the alternator to get to the bottom nut.

21. Using the sprocket removal tool, separate the injection pump from the sprocket.

22. Remove the removal tool and the sprocket nut. The sprocket holding tool and the timing belt will hold the sprocket in place, facilitating injection pump installation.

23. Remove the injection pump from the mounting brackets.

24. Remove the key from the shaft.

25. Remove the screw plug and copper washer located between the 4 high pressure fuel outlets, at the rear of the pump. Install dial indicator support tool Mot-856, or equivalent, in its place.

26. Install the stem of dial indicator Mot-LM, or equivalent, in the support tool.

To install:

27. Position a locknut and nut on the end of the injection pump driveshaft.

28. Tighten the locknut against the nut.

29. Loosen the control cable set screw on the clevis, move the levers back slightly and turn the clevis pin $\frac{1}{4}$ turn to disengage the cold start system.

30. Using the locknut, turn the pump driveshaft in the normal direction of rotation, to position the piston at bottom dead center. The dial indicator pointer will stop moving when the piston is at BTDC. Zero the pointer.

31. The pump driveshaft keyway should be located just before the centerline of the number 1 fuel outlet fitting.

32. Remove the nut and locknut.

33. Insert the key in its keyway.

34. Mount the injection pump in the sprocket, aligning the key.

35. Loosely install the washers and retaining nuts on the mounting bracket studs.

36. Install the sprocket washer and retaining nut on the pump driveshaft. Torque the nut to 37 ft. lbs.

37. Remove the sprocket holding tool.

38. Rotate the crankshaft in a clockwise direction at least 2 full revolutions. Check the timing belt tension as follows:

a. Loosen the timing belt tensioner bolts $\frac{1}{2}$ turn each, maximum.

b. The belt tensioner should, au-

tomatically, place the proper tension on the belt.

c. Using belt tension gauge ELE 346-04 or equivalent, at the straight, upper run, between the pump and camshaft sprockets, check belt deflection. Deflection should be 3-5mm when the gauge shoulder is flush with the plunger body.

39. Remove the threaded plug from the block, just behind the pump, and insert TDC rod Mot-861, or equivalent.

40. Slowly rotate the crankshaft clockwise until tool Mot-861 can be inserted into the TDC slot in the crankshaft counterweight.

41. At this point, the dial indicator pointer should indicate a piston travel distance of $0.82\text{mm} \pm 0.02\text{mm}$.

42. If the indicated travel is not within specifications, adjust it as follows:

a. Rotate the pump toward, then away from the engine to increase travel, or

b. Rotate the pump away from the engine to decrease lift.

NOTE: Adjustment should always be made by rotation away from the engine.

43. Tighten the injection pump mounting nuts.

44. Remove the TDC rod from the counterweight slot.

45. Observe the dial indicator and rotate the crankshaft clockwise 2 full revolutions until the rod can, once again, be installed into the counterweight hole. The dial indicator should return to 0, then move to $0.82\text{mm} \pm 0.02\text{mm}$. If so, injection pump static timing is correct.

46. Remove the TDC rod and install the plug.

47. Remove the dial indicator and install the washer and screw plug in the pump.

48. Connect the high pressure lines at the injectors.

49. Compress the timing control lever and install the clevis pin in the first position on the cable clamp.

50. With the lever against the clevis, tighten the setscrew.

51. Install and tighten the pump rear support bracket nuts.

52. Install all other parts in reverse order of removal.

NOTE: Don't mix the fuel delivery and return hose banjo bolts. The delivery banjo bolt has two 4mm diameter holes; the return banjo bolt has a calibrated orifice.

IDLE SPEED ADJUSTMENT

1. The idle speed is adjusted on the injection pump linkage.

2. Loosen the screw locknut, adjust the idle speed to 800 ± 50 rpm with the adjusting screw and tighten the locknut.

Diesel Injection Timing ADJUSTMENT

1. Remove the injection pump.

2. Remove the key from the shaft.

3. Remove the screw plug and copper washer located between the 4 high pressure fuel outlets, at the rear of the pump. Install dial indicator support tool Mot-856, or equivalent in its place.

4. Install the stem of dial indicator Mot-LM, or equivalent in the support tool.

5. Position a locknut and nut on the end of the injection pump driveshaft.

6. Tighten the locknut against the nut.

7. Loosen the control cable set screw on the clevis, move the levers back slightly and turn the clevis pin $\frac{1}{4}$ turn to disengage the cold start system.

8. Using the locknut, turn the pump driveshaft in the normal direction of rotation, to position the piston at bottom dead center. The dial indicator pointer will stop moving when the piston is at BTDC. Zero the pointer.

9. The pump driveshaft keyway should be located just before the centerline of the number 1 fuel outlet fitting.

10. Remove the nut and locknut.

11. Insert the key in its keyway.

12. Mount the injection pump in the sprocket, aligning the key.

13. Loosely install the washers and retaining nuts on the mounting bracket studs.

14. Install the sprocket washer and retaining nut on the pump driveshaft. Torque the nut to 37 ft. lbs.

15. Remove the sprocket holding tool.

16. Rotate the crankshaft in a clockwise direction at least 2 full revolutions. Check the timing belt tension as follows:

a. Loosen the timing belt tensioner bolts $\frac{1}{2}$ turn each, maximum.

b. The belt tensioner should, automatically, place the proper tension on the belt.

c. Using a belt tension gauge, at the straight, upper run, between the pump and camshaft sprockets, check belt deflection. Deflection should be 3-5mm when the gauge shoulder is flush with the plunger body.

17. Remove the threaded plug from the block, just behind the pump, and

insert TDC rod Mot-861, or equivalent.

18. Slowly rotate the crankshaft clockwise until tool Mot-861, or equivalent can be inserted into the TDC slot in the crankshaft counterweight.

19. At this point, the dial indicator pointer should indicate a piston travel distance of $0.82\text{mm} \pm 0.02\text{mm}$.

20. If the indicated travel is not within specifications, adjust it as follows:

a. Rotate the pump toward, then away from the engine to increase travel, or

b. Rotate the pump away from the engine to decrease lift.

NOTE: Adjustment should always be made by rotation away from the engine.

21. Tighten the injection pump mounting nuts.

22. Remove the TDC rod from the counterweight slot.

23. Observe the dial indicator and rotate the crankshaft clockwise 2 full revolutions until the rod can, once again, be installed into the counterweight hole. The dial indicator should return to 0, then move to $0.82\text{mm} \pm 0.02\text{mm}$. If so, injection pump static timing is correct.

24. Remove the TDC Rod and install the plug.

25. Remove the dial indicator and install the washer and screw plug in the pump.

26. Connect the high pressure lines at the injectors.

27. Compress the timing control lever and install the clevis pin in the first position on the cable clamp.

28. With the lever against the clevis, tighten the setscrew.

29. Install and tighten the pump rear support bracket nuts.

30. Install all other parts in reverse order of removal.

NOTE: Don't confuse the fuel delivery and return hose banjo bolts. The delivery banjo bolt has two 4mm diameter holes; the return banjo bolt has a calibrated orifice.

Fuel Injector

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the fuel return hoses and fittings from the injectors.

3. Remove the high pressure lines from the injectors.

4. Remove both injector clamp nuts and washers from each injector.

5. Remove the injector clamp.

6. Pull the injector from the head.

7. Remove the copper seal and the heat shield.

To install:

8. Clean the injector bore with a brass brush.

9. Install a new heat shield and a new copper seal.

10. Install the injector, high pressure fuel lines (finger tight at this time), clamps, washers and nuts.

11. Tighten the high pressure fuel lines.

12. Use new washers and install the fuel return lines. Tighten the fittings to 88 inch lbs.

EMISSION CONTROLS

Emission Warning Lamps

Please refer to "Emission Control" in the Unit Repair section for system maintenance procedures. Due to the complex nature of modern electronic engine control systems, comprehensive diagnosis and testing procedures fall outside the confines of this repair manual. For complete information on diagnosis, testing and repair procedures concerning all modern engine and emission control systems, please refer to "Chilton's Guide to Electronic Engine Controls".

The emission maintenance reminder light is connected to a timer, which will activate the light when PCV valve and oxygen sensor service is required. The interval for this light is 82,500 miles at high time the timer module must be replaced as part of the emission service. There is no way to reset this lamp, except to replace the timer module.

The timer module is located under the instrument panel, above the parking brake assembly.

GASOLINE ENGINE MECHANICAL

NOTE: Disconnecting the battery cable on some vehicles may

interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is disconnected.

Engine

REMOVAL & INSTALLATION

2.5L Engine

1. Disconnect the negative battery cable. As required, relieve the fuel system pressure.

2. Matchmark the hood and hinges, and remove the hood.

3. Remove the air cleaner. Drain the coolant and engine oil.

4. Remove the radiator hoses. Remove the fan shroud and transmission cooler lines.

5. Discharge the refrigerant. Remove the condenser and radiator.

6. Remove the fan and install a $\frac{5}{16}$ in. $\times$ $\frac{1}{2}$ in. bolt through the pulley and into the water pump flange to maintain pulley alignment.

7. Disconnect the heater hoses.

8. Disconnect and tag all wires, hoses, and cables connected to the engine.

9. Remove the service ports from the air conditioning compressor and cap the openings.

10. Drain the power steering reservoir. Remove the power steering hoses at the gear.

11. Remove the check valve from the power brake vacuum hose.

12. Raise and safely support the vehicle.

13. Remove the starter. Disconnect the exhaust pipe at the manifold.

14. Remove the converter access plate, if equipped with an automatic transmission.

15. On vehicles equipped with automatic transmission, matchmark the torque converter and flywheel. Remove the attaching bolts.

16. Remove the upper flywheel housing-to-engine bolts; loosen the lower ones.

17. Lower the vehicle. Connect a suitable engine lift to the engine and remove the weight from the engine.

18. Remove the engine mount bolts. Raise the engine off the mounts.

19. Support the transmission with a floor jack.

20. Remove the remaining engine-to-flywheel housing bolts.

21. Move the engine forward to clear the transmission, and lift it from the vehicle.

To install:

22. Lower the engine into the vehicle.

NOTE: Be sure to align the engine with the mounts.

23. On vehicles with a manual transmission, engage the transmission input shaft with the clutch splines. Align the flywheel housing bolt holes and install the lower engine-to-transmission bolts finger tight.

24. On vehicles with an automatic transmission, align the torque converter housing and engine. Loosely install the 4 lower transmission-to-engine bolts.

25. Lower the engine onto the mounts. Remove the lifting device.

26. On vehicles equipped with an automatic transmission, install the torque converter-to-flywheel bolts. Torque the bolts to 40 ft. lbs.

27. Install the converter housing access plate.

28. Install the remaining engine-to-flywheel housing bolts. Torque the upper bolts to 27 ft. lbs.; the lower bolts to 43 ft. lbs.

29. Install the engine mount bolts. Torque the bolts to 48 ft. lbs.

30. Connect the exhaust pipe at the manifold. Torque the bolts to 23 ft. lbs.

31. Install the starter. Install the check valve on the power brake vacuum hose.

32. Install the power steering hoses at the gear. Fill the power steering reservoir.

33. Install the service ports on the air conditioning compressor.

34. Connect all wires, hoses, and cables to the engine.

35. Install the fan and pulley. Install the condenser and radiator.

36. Install the fan shroud and transmission cooler lines. Connect the radiator hoses.

37. Fill the cooling system and crankcase to the correct levels.

38. Install the air cleaner. Install the hood.

39. Connect the negative battery cable.

40. Evacuate, charge and leak test the refrigerant system.

2.8L Engine

1. Remove the negative battery cable. As required, relieve the fuel system pressure.

2. Remove the air cleaner. Scribe the location of the hood hinges and remove the hood.

3. Drain the cooling system. Remove the upper and lower radiator hoses.

4. Remove the fan shroud. Disconnect the automatic transmission cooler lines, if equipped.

5. Discharge the air conditioning refrigerant. Remove the radiator/condenser assembly.

6. Remove the fan. If equipped with a fan clutch, do not lay the fan on its

back or front. This will cause the clutch to leak and be irreversibly damaged.

7. Remove the heater hoses. Disconnect and tag all remaining hoses attached to the engine.

8. Disconnect and tag all electrical leads attached to the engine.

9. Remove the power steering pump.

10. Disconnect the fuel pipe at the pump. Disconnect the refrigerant hoses at the compressor and cap the openings.

11. Raise and safely support the vehicle.

12. Disconnect the exhaust pipe at the converter flange. Remove the flywheel housing access plate.

13. On vehicles equipped with automatic transmission, matchmark the converter-to-flywheel and remove the bolts.

14. Remove the flywheel housing-to-engine bolts. Lower the vehicle.

15. Place a suitable jack under the transmission.

16. Attach a suitable lifting device to the engine lifting eyes. Remove the engine mount bolts and lift the engine from the vehicle.

To install:

17. Lower the engine into position in the vehicle, align the engine mounts while lowering the engine.

18. Install the flywheel housing-to-engine bolts finger tight.

19. Install the engine mount bolts. Torque the through-bolts to 92 ft. lbs.

20. Remove the lifting device and the transmission support.

21. On vehicles equipped with an automatic transmission, install the converter-to-flywheel bolts. Torque the bolts to 25 ft. lbs.

22. Install the flywheel housing access plate. Torque the engine-to-transmission bolts to 40 ft. lbs.

23. Connect the exhaust pipe at the converter flange. Connect the refrigerant hoses at the compressor.

24. Connect the fuel pipe at the pump. Install the power steering pump.

25. Connect all wires attached to the engine. Connect all electrical leads to the engine.

26. Connect all remaining hoses attached to the engine. Install the fan.

27. Install the radiator/condenser assembly. Connect the automatic transmission cooler lines. Install the fan shroud.

28. Install the upper and lower radiator hoses. Fill the cooling system.

29. Install the hood. Install the air cleaner and connect the negative battery cable.

30. Evacuate, charge and leak test the refrigerant system.

4.0L Engine

1. Disconnect the battery cables. Matchmark the hood and hinges and remove the hood.

2. Raise and safely support the vehicle. Drain the engine oil. Drain the cooling system. Lower the vehicle. Relieve the fuel system pressure.

3. Remove the battery and remove the air cleaner.

4. Remove the upper and lower radiator hoses.

5. Disconnect and cap the automatic transmission cooler lines, if equipped.

6. Remove the fan shroud and remove the radiator. Remove the electric cooling fan.

7. Disconnect the vacuum harness connector at the intake manifold.

8. Disconnect the electric fan switch. On vehicles with air conditioning, discharge the system, remove the compressor service valves and cap the ports.

9. Remove the radiator or radiator/condenser assembly. Disconnect the accelerator linkage. Disconnect the heater hoses at the engine.

10. Disconnect the cruise control cable, if equipped. Disconnect and tag all wires, hoses, cables, vacuum lines, etc., connected to the engine or in the way of engine removal.

11. Disconnect the injection system wiring harness at the firewall.

12. Disconnect the quick-connect fuel lines at the fuel rail and return line by squeezing the 2 tabs against the tube. Pull the fuel tube and retainer from the quick-connect fitting.

13. Remove the power brake vacuum check valve from the booster.

14. Disconnect the power steering hoses from the steering gear, drain the pump reservoir, and cap all openings.

15. Raise and safely support the vehicle. Remove the starter and disconnect the exhaust pipe at the support bracket and the manifold.

16. Disconnect the engine speed sensor wiring (2 screws). Remove the exhaust pipe support bracket.

17. On vehicles, equipped with an automatic transmission, remove the inspection cover. Matchmark the torque converter and flex plate. Turning the engine by hand, remove each torque converter-to-flex plate bolt.

18. Remove the upper flywheel housing-to-engine bolts and loosen the bottom bolts.

19. Remove the engine front support-to-frame nuts and lower the vehicle.

20. Take up the weight of the engine with a suitable lifting device. Support the transmission with a suitable jack.

21. Remove the lower engine-to-bellhousing bolts. Raise the engine,

while guiding it forward and out of the vehicle.

To install:

22. Lower the engine into the vehicle.

NOTE: Be very careful to avoid damaging the trigger wheel on the flywheel on vehicles equipped with an automatic transmission.

23. On vehicles with a manual transmission, insert the input shaft into the clutch splines, align the flywheel housing with the engine and install the lower bolts finger tight.

24. On vehicles with an automatic transmission, align the engine and converter housing and install the 4 lower bolts finger tight.

25. Install the engine mount bolts finger tight.

26. Remove the transmission support and the engine lifting device.

27. Install the remaining flywheel housing-to-engine bolts and tighten all bolts to 28 ft. lbs. Raise and safely support the vehicle.

28. On vehicles equipped with an automatic transmission, turn the engine by hand and install each torque converter-to-flex plate bolt. Torque the bolts to 40 ft. lbs. Install the access cover.

29. Remove the exhaust pipe support bracket and connect the exhaust pipe.

30. Connect the engine speed sensor wiring (2 screws). Install the starter.

31. Connect the power steering hoses at the gear and fill the pump reservoir.

32. Install the power brake vacuum check valve at the booster.

33. Connect the quick-connect fuel lines at the fuel rail and return line.

34. Connect the injection system wiring harness at the firewall. Connect all wires, hoses, cables, vacuum lines, etc. Connect the cruise control cable.

35. Connect the accelerator linkage. Install the radiator or radiator/condenser assembly. On vehicles with air conditioning, install the compressor service valves.

36. Install the electric cooling fan and connect the electric fan switch.

37. Connect the vacuum harness connector at the intake manifold. Install the fan shroud.

38. Connect the automatic transmission cooler lines. Install the upper and lower radiator hoses. Install the air cleaner and the battery.

39. Refill the cooling system and the crankcase. Install the hood.

40. Evacuate, charge and leak test the refrigerant system.

4.2L Engine

1. Disconnect the negative battery cable. As required, relieve the fuel system pressure. Remove the air cleaner.

Drain the cooling system and the engine oil.

2. Disconnect the upper and lower radiator hoses.

3. If equipped with an automatic transmission, disconnect the cooler lines from the radiator. Remove the radiator and the fan. If equipped with air conditioning, evacuate the system, remove the condenser and cap all openings immediately.

4. If so equipped, remove the power steering pump and the drive belt, and place the unit aside. Do not remove the power steering hoses.

5. If the vehicle has air conditioning, remove the compressor. Disconnect all wires, lines, linkage, and hoses that are connected to the engine. Remove the oil filter.

6. Remove both of the engine front support cushion-to-frame retaining nuts.

7. Disconnect the exhaust pipe at the support bracket and exhaust manifold.

8. Support the weight of the engine with a lifting device.

9. Remove the front support cushion and bracket assemblies from the engine.

10. Remove the transfer case shift lever boot and the transmission access cover.

11. If equipped with an automatic transmission, remove the upper bolts securing the transmission bell housing to the engine. If equipped with a manual transmission, remove the upper bolts that secure the clutch housing to the engine.

12. Remove the starter motor. If the vehicle is equipped with an automatic transmission:

a. Remove the engine to transmission adapter plate inspection covers.

b. Mark the assembled position of the converter and flex plate and remove the converter-to-flex plate retaining screws.

c. Remove the remaining bolts securing the transmission bell housing to the engine.

13. If equipped with a manual transmission, remove the lower cover of the clutch housing and the remaining bolts that secure the clutch housing to the engine.

14. Support the transmission with a floor jack.

15. Attach a suitable lifting device to the engine and using a hoist, lift the engine upward and forward at the same time, removing it from the vehicle.

To install:

16. Lower the engine into the vehicle and slide it rearward to engage the transmission.

17. If equipped with an automatic transmission, install the upper bolts securing the transmission bell housing to the engine. Torque to 27 ft. lbs. If equipped with a manual transmission, install the upper bolts that secure the clutch housing to the engine. Torque to 27 ft. lbs.

18. If equipped with a manual transmission, install the lower cover of the clutch housing and the remaining bolts that secure the clutch housing to the engine. Torque the clutch housing spacer-to-bolts to 12-15 ft. lbs. Torque the clutch housing lower bolts to 43 ft. lbs.

19. If the vehicle is equipped with an automatic transmission:

a. Install the remaining bolts securing the transmission bell housing to the engine. Torque the bell housing lower bolts to 43 ft. lbs.

b. Mark the assembled position of the converter and flex plate and install the converter-to-flex plate retaining screws. Torque the bolts to 20-25 ft. lbs.

c. Install the engine to transmission adapter plate inspection covers.

20. Install the starter motor. Torque the mounting bolts to 18 ft. lbs.

21. Install the transfer case shift lever boot and the transmission access cover.

22. Install the front support cushion and bracket assemblies from the engine.

23. Remove the lifting device.

24. Connect the exhaust pipe at the support bracket and exhaust manifold. Torque the nuts to 20 ft. lbs.

25. Install both of the engine front support cushion-to-frame retaining nuts. Torque to 35 ft. lbs.

26. Connect all wires, lines, linkage, and hoses that are connected to the engine. Install the oil filter.

27. If so equipped, install the power steering pump and the drive belt.

28. Install the radiator and the fan, and the condenser. Evacuate, charge and leak test the refrigerant system.

29. If equipped with an automatic transmission, connect the cooler lines to the radiator.

30. Connect the upper and lower radiator hoses and fill the cooling system.

31. Install the air cleaner. Connect the negative battery cable.

5.9L Engine

1. Disconnect the negative battery cable. Remove the air cleaner.

2. Drain the cooling system.

3. Disconnect the upper and lower radiator hoses.

4. If equipped with an automatic transmission, disconnect the cooler lines from the radiator.

5. Remove the radiator and the fan. If equipped with air conditioning, evacuate the system, remove the condenser and cap all openings immediately.

6. If so equipped, remove the power steering pump and the drive belt, place the unit aside. Do not remove the power steering hoses.

7. If the vehicle has air conditioning, remove the compressor.

8. Disconnect all wires, lines, linkage, and hoses that are connected to the engine. Raise and safely support the vehicle.

9. Remove both of the engine front support cushion-to-frame retaining nuts.

10. Disconnect the exhaust pipes at the support bracket and exhaust manifold.

11. Support the weight of the engine with a lifting device.

12. Remove the front support cushion and bracket assemblies from the engine.

13. Remove the transfer case shift lever boot and the transmission access cover.

14. If equipped with an automatic transmission, remove the upper bolts securing the transmission bell housing to the engine. If equipped with a manual transmission, remove the upper bolts that secure the clutch housing to the engine.

15. Remove the starter motor.

16. If the vehicle is equipped with an automatic transmission:

a. Remove the engine to transmission adapter plate inspection covers.

b. Mark the assembled position of the converter and flex plate and remove the converter-to-flex plate retaining screws.

c. Remove the remaining bolts securing the transmission bell housing to the engine.

17. If equipped with a manual transmission, remove the lower cover of the clutch housing and the remaining bolts that secure the clutch housing to the engine. Lower the vehicle.

18. Support the transmission with a suitable jack.

19. Attach a suitable lifting device to the engine and lift the engine upward and forward at the same time, removing it from the vehicle.

To install:

20. Lower the engine into the vehicle and slide it rearward to engage the transmission.

21. If equipped with an automatic transmission, install the upper bolts securing the transmission bell housing to the engine. Torque them to 27 ft. lbs. If equipped with a manual transmission, install the upper bolts that

secure the clutch housing to the engine. Torque them to 27 ft. lbs.

22. If equipped with a manual transmission, install the lower cover of the clutch housing and the remaining bolts that secure the clutch housing to the engine. Torque the clutch housing spacer-to-bolts to 12-15 ft. lbs. Torque the clutch housing lower bolts to 43 ft. lbs.

23. If the vehicle is equipped with an automatic transmission:

a. Install the remaining bolts securing the transmission bell housing to the engine. Torque the bell housing lower bolts to 43 ft. lbs.

b. Mark the assembled position of the converter and flex plate and install the converter-to-flex plate retaining screws. Torque the bolts to 20-25 ft. lbs.

c. Install the engine to transmission adapter plate inspection covers.

24. Install the starter motor. Torque the mounting bolts to 18 ft. lbs.

25. Install the transfer case shift lever boot and the transmission access cover.

26. Install the front support cushion and bracket assemblies from the engine.

27. Remove the lifting device.

28. Connect the exhaust pipes at the support bracket and exhaust manifold. Torque the nuts to 20 ft. lbs.

29. Install both of the engine front support cushion-to-frame retaining nuts. Torque them to 35 ft. lbs.

30. Connect all wires, lines, linkage, and hoses to the engine.

31. If so equipped, install the power steering pump and the drive belt.

NOTE: If the vehicle has air conditioning, mount and connect the air conditioning compressor.

32. Install the radiator, fan and the condenser.

33. Evacuate, charge and leak test the refrigerant system.

34. If equipped with an automatic transmission, connect the cooler lines to the radiator.

35. Connect the upper and lower radiator hoses.

36. Fill the cooling system and connect the negative battery cable.

37. Install the air cleaner.

Cylinder Head

REMOVAL & INSTALLATION

2.5L Engine

1. Disconnect the negative battery cable. As required, relieve the fuel system pressure.

2. Drain the cooling system.

3. Disconnect the hoses at the thermostat housing.

Cylinder head bolt torque sequence—2.5L engine

4. Remove the air cleaner.

5. Remove the rocker arm cover. The cover seal is RTV sealer. Break the seal with a clean putty knife or razor blade. Don't attempt to remove the cover until the seal is broken. To remove the cover, pry where indicated at the bolt holes.

6. Remove the rocker arms and the pushrods. Keep them in their original order for installation.

7. Remove the power steering pump bracket. Suspend the pump out of the way.

8. Remove the intake and exhaust manifolds.

9. Remove the air conditioning compressor drive belt, if equipped.

10. Loosen the alternator drive belt. Remove the compressor/alternator bracket mounting bolt and unbolt the compressor. Suspend it out of the way without disconnecting the refrigerant lines.

11. Remove the spark plugs. Disconnect the temperature sending unit wire.

12. Remove the cylinder head bolts in the reverse order of the installation torque sequence.

13. Lift the head off the engine and remove the head gasket.

14. Thoroughly clean the gasket mating surfaces. Remove all traces of old gasket material. Remove all carbon deposits from the combustion chambers. Lay a straightedge across the head and check for flatness. Total deviation should not exceed 0.025mm.

To install:

15. Install the head gasket. Apply sealer to both sides of the new gasket. Place the head on the engine.

16. For carbureted engines, using the correct torque sequence, coat No.8 head bolt threads with Permatex No.2 sealant. Install the head bolts. Torque all the head bolts in sequence, in 3

even steps. The final step should be 110 ft. lbs. for all bolts except No. 8. That bolt is torqued to 100 ft. lbs.

17. Connect the temperature sending unit wire. Install the spark plugs.

18. Install the compressor/alternator bracket mounting bolt.

19. Install the accessory drive belt. Install the intake and exhaust manifolds. Install the power steering pump bracket.

20. Install the pushrods and rocker arms in their original positions.

21. Install the rocker arm cover. The cover gasket is RTV sealer. Thoroughly clean the mating surfaces of the head and rocker cover. Run a 1/8 in. bead of RTV sealer along the length of the sealing surface of the head. Position the cover on the head within 10 minutes of applying the sealer. Torque the cover bolts, in a crisscross pattern, to 55 inch lbs.

22. Install the air cleaner. Connect the hoses at the thermostat housing.

23. Fill the cooling system. Connect the negative battery cable.

24. Run the engine to normal operating temperature and check for leaks.

2.8L Engine

LEFT SIDE

1. Disconnect the negative battery cable. Raise and support the vehicle safely. Disconnect the exhaust pipe from the exhaust manifold.

2. Drain the coolant from the block and lower the vehicle.

3. Remove the intake manifold. Remove the exhaust manifold.

4. If equipped, remove the power steering pump and bracket. Remove the dipstick tube from the cylinder head.

5. Remove the rocker arm cover bolts and remove the cover. Loosen the rocker arm bolts and remove the push-

Cylinder head bolt torque sequence—2.8L engine

rods. Keep the pushrods in the same order as removed.

6. Remove the cylinder head bolts in stages and in the reverse order of the tightening sequence.

7. Remove the cylinder head. Do not pry on the head to loosen it.

To install:

8. Thoroughly clean the head and block mating surfaces. All bolt holes must be free of foreign material.

9. Place a new head gasket on the block with the words "This Side Up", facing up.

10. Position the cylinder head on the block.

11. Coat the cylinder head bolts with RTV silicone sealant and install them. Torque the bolts, in sequence, to the correct torque in 3 equal stages.

12. Install the pushrods and rocker arms, keeping them in the same order as removed.

13. Install the dipstick tube. Install the power steering pump and bracket.

14. Install the exhaust manifold. Install the intake manifold.

15. Connect the exhaust pipe from the exhaust manifold.

16. Fill the cooling system. Connect the negative battery cable.

17. Run the engine to normal operating temperature and check for leaks.

RIGHT SIDE

1. Disconnect the negative battery cable. Raise and support the vehicle safely. Drain the coolant from the block.

2. Disconnect the exhaust pipe and lower the vehicle.

3. If equipped, remove the cruise control servo bracket.

4. Remove the alternator and air pump bracket assembly.

5. Remove the intake manifold. Remove the rocker arm cover.

6. Loosen the rocker arm nuts and remove the pushrods. Keep the pushrods in the order in which they were removed.

7. Remove the cylinder head bolts in stages and in the reverse order of the tightening sequence.

8. Remove the cylinder head. Do not pry on the cylinder head to loosen it.

To install:

9. Thoroughly clean the head and block mating surfaces. All bolt holes must be free of foreign material.

10. Place a new head gasket on the block with the words "This Side Up", facing up.

11. Position the cylinder head on the block.

12. Coat the cylinder head bolts with RTV silicone sealant and install them. Torque the bolts, in sequence, to the correct torque.

13. Install the pushrods, keeping them in the same order as removed.

14. Install the rocker arms and the rocker arm cover.

15. Install the exhaust manifold. Install the intake manifold.

16. Connect the exhaust pipe from the exhaust manifold.

17. Fill the cooling system.

19. Connect the negative battery cable.

20. Run the engine to normal operating temperature and check for leaks.

4.0L and 4.2L Engine

1. Disconnect the negative battery

cable. Drain the cooling system and disconnect the hoses at the thermostat housing. As required, relieve the fuel system pressure.

2. Remove the cylinder head cover (valve cover), the gasket, the rocker arm assembly, and the pushrods.

NOTE: The pushrods must be replaced in their original positions.

3. Remove the intake and exhaust manifold from the cylinder head.

4. Disconnect the spark plug wires and the spark plugs to avoid damaging them.

5. Disconnect the temperature sending unit wire, ignition coil and bracket assembly from the engine.

6. Unbolt and set aside the power steering pump and bracket. Do not disconnect the hoses.

7. Remove the intake and exhaust manifold assembly.

8. Remove the air conditioning compressor drive belt pulley.

9. Loosen the serpentine belt tension.

10. Remove the alternator.

11. Unbolt the air conditioning compressor and set it aside. Don't disconnect the refrigerant lines.

12. Remove the ignition coil.

13. Remove the cylinder head bolts, the cylinder head and gasket from the block.

14. Discard the gasket. Thoroughly clean the head and block mating surfaces. Check them for warpage with a straightedge. Deviation should not exceed 0.002 in. in a 6 in. span.

To install:

15. Coat a new head gasket with sealer and place it on the block. Most replacement gaskets will have the word **TOP** stamped on them.

16. Install the cylinder head and bolts. The threads of bolt No. 11 must be coated with Loctite® 592 sealant before installation. Tighten the bolts in sequence, using the correct sequence, to 22 ft. lbs. Then, torque them to 45 ft. lbs. in sequence. When complete, check the torque at 45 ft. lbs. on all bolts in sequence. Then, torque all the bolts in sequence to 110 ft. lbs., except for No. 11, which is torqued to 100 ft. lbs.

17. Install the ignition coil.

18. Install the air conditioning compressor. Install the alternator.

19. Adjust the serpentine belt tension.

20. Install the air conditioning compressor drive belt pulley.

21. Install the intake and exhaust manifold assembly.

22. Install the power steering pump and bracket.

23. Connect the temperature sending unit wire, ignition coil and bracket.

Cylinder head bolt torque sequence—4.0L and 4.2L engines

Cylinder head bolt torque sequence—5.9L engine

24. Connect the spark plug wires.
25. Install the pushrods, rocker arm assembly, gasket, and cylinder head cover.
26. Connect the hoses at the thermostat housing.
27. Fill the cooling system. Connect the negative battery cable.
28. Run the engine to normal operating temperature and check for leaks.

5.9L Engine

1. Disconnect the negative battery cable. Drain the cooling system.
2. When removing the right cylinder head, it may be necessary to remove the heater core housing from the firewall.
3. Remove the valve cover(s) and gasket(s).
4. Remove the rocker arm assemblies and the pushrods.

NOTE: The valve train components must be replaced in their original positions.

5. Remove the spark plugs to avoid damaging them.
6. Remove the intake manifold with the carburetor still attached.
7. Remove the exhaust pipes at the flange of the exhaust manifold. When replacing the exhaust pipes it is advisable to install new gaskets at the flange.
8. Loosen the accessory drive belts.
9. Disconnect the alternator bracket from the right cylinder head.
10. Disconnect the air pump and power steering pump brackets from the left cylinder head.
11. Remove the cylinder head bolts

and lift the head(s) from the cylinder block.

12. Remove the cylinder head gasket from the head or the block.

13. Thoroughly clean the gasket mating surfaces. Remove all traces of old gasket material. Remove all carbon deposits from the combustion chambers. Lay a straightedge across the head and check for flatness. Total deviation should not exceed 0.001 in. (0.025mm).

To install:

14. Do not apply sealant to the head or block. Coat both sides of the gasket with sealer. The gasket should be stamped **TOP** for installation. Place the gasket on the block.
15. Install the head on the block. Insert the bolts and tighten, in sequence, to the proper torque.
16. Connect the air pump and power steering pump brackets to the left cylinder head.
17. Connect the alternator bracket to the right cylinder head.
18. Adjust all the accessory drive belts.
19. Install the exhaust pipes at the flange of the exhaust manifold. When replacing the exhaust pipes it is advisable to install new gaskets at the flange.
20. Install the intake manifold with the carburetor still attached.
21. Install the spark plugs.
22. Install the rocker arm assemblies and the pushrods.

NOTE: The valve train components must be replaced in their original positions.

23. Install the valve cover(s) and gasket(s).

24. Install the heater core housing on the firewall, if removed.

25. Fill the cooling system and connect the negative battery cable.

26. Run the engine to normal operating temperature and check for leaks.

Valve Lash

ADJUSTMENT

2.8L Engine

1. Tighten the rocker arm nut until it just touches the valve stem.

2. Rotate the engine until number one piston is at TDC of the compression stroke. The 0 on the timing scale should be aligned with the timing pointer and the rotor should be at the number one spark plug tower of the distributor cap. The following valves can now be adjusted:

Exhaust valves—1-2-3

Intake valves—1-5-6

4. Turn the adjusting nut until it backs off the stem slightly, then tighten until it just touches the stem. Then turn the nut 1½ turns more to center the tappet plunger.

5. Rotate the engine 1 complete revolution more. This will bring No. 4 piston to TDC on the compression stroke. At this point the following valves should be adjusted:

Exhaust valves—4-5-6

Intake valves—2-3-4

Rocker Arms and Shafts

REMOVAL & INSTALLATION

2.5L, 4.0L and 4.2L Engines

1. Disconnect the negative battery cable. As required, relieve the fuel system pressure. Remove the valve cover.
2. Remove the 2 capscrews at each bridge and pivot assembly.
3. Remove the bridges, pivots and rocker arms. Keep them in order as they must be installed in the same position as they were removed.
4. Installation is the reverse of the removal procedure. Torque the capscrews to 19 ft. lbs. Be sure to use new gaskets or RTV sealant as required.

2.8L Engine

1. Disconnect the negative battery cable. Remove the valve cover and gasket. Remove the rocker arm nut and ball.
2. Lift the rocker arm off the rocker arm stud, always keep the rocker arm, nut and ball together and always assemble them on the same stud.

Typical rocker arm assembly

Intake manifold bolt torque sequence—2.5L engine

3. Remove the pushrod from its bore. Make sure the pushrods are always installed in the same bore with the same end in the block.

4. Installation is the reverse of the removal procedure. As required, adjust the valves. Torque the rocker arm nut to 20 ft. lbs.

5.9L Engine

1. Disconnect the negative battery cable. Remove the valve cover and gasket.

2. Loosen the bridged pivot cap screws a turn at a time, so as not to break the bridge.

3. Remove the rocker arm and bridge assembly from the cylinder head. Keep these components in order and reinstall them in the same position as removed.

4. Installation is the reverse of the removal procedure. Torque the cap screws to 19 ft. lbs.

Intake Manifold

REMOVAL & INSTALLATION

2.5L Engine

NOTE: It may be necessary to remove the carburetor or the throttle body from the intake manifold before the manifold is removed.

1. Disconnect the negative battery cable. As required, relieve the fuel system pressure. Drain the coolant.

2. Remove the air cleaner. Disconnect the fuel pipe. Remove the carburetor or the throttle body, as required.

3. Disconnect the coolant hoses from the intake manifold.

4. Disconnect the throttle cable from the bellcrank.

5. Disconnect the PCV valve vacuum hose from the intake manifold.

6. If equipped, remove the vacuum

advance CTO valve vacuum hoses.

7. Disconnect the system coolant temperature sender wire connector (located on the intake manifold). Disconnect the air temperature sensor wire, if equipped.

8. Disconnect the vacuum hose from the EGR valve.

9. On vehicles equipped with power steering remove the power steering pump and its mounting bracket. Do not detach the power steering pump hoses.

10. Disconnect the intake manifold electric heater wire connector, as required.

11. Disconnect the throttle valve linkage, if equipped with automatic transmission.

12. Disconnect the EGR valve tube from the intake manifold.

13. Remove the intake manifold attaching screws, nuts and clamps. Remove the intake manifold. Discard the gasket.

14. Clean the mating surfaces of the manifold and cylinder head.

NOTE: If the manifold is being replaced, ensure all fittings, etc., are transferred to the replacement manifold.

To install:

15. Clean the mating surfaces of the manifold and cylinder head.

16. Install the intake manifold, with a new gasket. Install the intake manifold attaching screws, nuts and clamps. Torque the nuts to 23 ft. lbs.

17. Connect the EGR valve tube. Connect the throttle valve linkage, if equipped with automatic transmission.

18. Connect the intake manifold electric heater wire connector, as required.

19. On vehicles equipped with power steering install the power steering pump and its mounting bracket.

20. Connect the vacuum hose to the EGR valve. Connect the system coolant temperature sender wire connector (located on the intake manifold).

21. Connect the air temperature sensor wire, if equipped. If equipped, install the vacuum advance CTO valve vacuum hoses.

22. Connect the PCV valve vacuum hose at the intake manifold. Connect the throttle cable at the bellcrank.

23. Connect the coolant hoses at the intake manifold.

24. Install the carburetor or the throttle body, as required. Torque the nuts to 14 ft. lbs.

25. Connect the fuel pipe. Install the air cleaner.

26. Connect the negative battery cable.

27. Fill the cooling system.

Intake manifold bolt torque sequence—2.8L engine

2.8L Engine

NOTE: It may be necessary to remove the carburetor from the intake manifold before the manifold is removed.

1. Disconnect the negative battery cable. Drain the radiator.

2. If equipped with air conditioning disconnect the compressor and move it aside. Disconnect the spark plug wires at the spark plugs. Disconnect the wires at the ignition coil.

3. If equipped, remove the air pump and bracket.

4. Remove the distributor cap. Mark the position of the ignition rotor in relation to the distributor body, and remove the distributor. Do not crank the engine with the distributor removed.

5. Remove the EGR valve. Remove the air hose. Disconnect the charcoal canister hoses. Remove the pipe bracket from the left cylinder head, if equipped.

6. Remove the diverter valve. Remove the power brake vacuum hose. Remove the heater and radiator hoses from the intake manifold.

7. Disconnect and label the vacuum hoses. If equipped, remove the EFE pipe from the rear of the manifold. Disconnect the coolant temperature switches.

8. Remove the carburetor linkage. Disconnect and plug the fuel line.

9. Remove the manifold retaining bolts and nuts.

10. Remove the intake manifold. Remove and discard the gaskets, and

scrape off the old silicone seal from the front and rear ridges.

To install:

11. The gaskets are marked for right and left side installation; do not interchange them. Clean the sealing surface of the engine block, and apply a 5mm wide bead of silicone sealer to each ridge.

12. Install the new gaskets onto the heads. The gaskets will have to be cut slightly to fit past the center pushrods. Do not cut any more material than necessary. Hold the gaskets in place by extending the ridge bead of sealer $\frac{1}{4}$ in. onto the gasket ends.

13. Install the intake manifold. The area between the ridges and the manifold should be completely sealed.

14. Install the retaining bolts and nuts, and tighten in sequence to 23 ft. lbs. Do not overtighten the manifold.

15. Complete the installation in the reverse order of the removal procedures. Adjust the ignition timing after installation, and check the coolant level.

5.9L Engine

1. Disconnect the negative battery cable. Drain the coolant from the radiator.

2. Remove the air cleaner assembly.

3. Disconnect the spark plug wires. Remove the spark plug wire brackets from the valve covers, and the bypass valve bracket.

4. Disconnect the upper radiator hose and the bypass hose from the intake manifold. Disconnect the heater hose from the rear of the manifold.

5. Disconnect the ignition coil bracket and lay the coil aside.

6. Disconnect the TCS solenoid vacuum valve from the right side valve cover.

7. Disconnect all lines, hoses, linkages and wires from the carburetor and intake manifold and TCS components as required.

8. Disconnect the air delivery hoses at the air distribution manifolds.

9. Disconnect the air pump diverter valve and lay the valve and the bracket assembly, including the hoses, forward of the engine.

10. Remove the intake manifold retaining bolts and remove the intake manifold. Remove and discard the side gaskets and the end seals.

To install:

11. Clean the mating surfaces of the intake manifold and the cylinder head before replacing the intake manifold. Use new gaskets and tighten the bolts to the correct torque.

NOTE: There is no specified tighten sequence for this intake manifold. Start at the center bolts and work outward.

12. Connect the air pump diverter valve.

13. Connect the air delivery hoses at the air distribution manifolds.

14. Connect all lines, hoses, linkages and wires to the carburetor and intake manifold and TCS components as required.

15. Install the TCS solenoid vacuum valve to the right side valve cover.

16. Install the ignition coil bracket.

17. Connect the upper radiator hose and the by-pass hose to the intake manifold. Connect the heater hose to the rear of the manifold.

18. Connect the spark plug wires. Install the spark plug wire brackets on the valve covers, and the bypass valve bracket.

19. Install the air cleaner assembly.

20. Fill the cooling system. Connect the negative battery cable.

Exhaust Manifold

REMOVAL & INSTALLATION

2.5L Engine

1. Disconnect the negative battery cable. Remove the intake manifold.

2. Disconnect the EGR tube.

3. Disconnect the exhaust pipe at the manifold.

4. Disconnect the oxygen sensor wire.

5. Support the manifold and remove the nuts from the studs.

6. If a new manifold is being installed, transfer the oxygen sensor. Torque the sensor to 35 ft. lbs.

7. Installation is the reverse of removal. Torque the nuts to 23 ft. lbs.

2.8L Engine

LEFT SIDE

1. Disconnect the negative battery cable. Remove the air cleaner. Remove the carburetor heat stove pipe.

2. Remove the air supply pipes from the exhaust manifold.

3. Raise and support the vehicle safely. Unbolt and remove the exhaust pipe at the manifold.

4. Unbolt and remove the manifold.

5. Clean the mating surfaces of the cylinder head and manifold. Install the manifold onto the head, and install the retaining bolts finger tight.

6. Tighten the manifold bolts in a circular pattern, working from the center to the ends, to 25 ft. lbs. in 2 stages.

7. Connect the exhaust pipe to the manifold.

8. The remainder of installation is the reverse of removal.

RIGHT SIDE

1. Disconnect the negative battery cable. Raise and support the vehicle safely.

2. Disconnect the exhaust pipe from the exhaust manifold.

3. Lower the vehicle. Remove the spark plug wires from the plugs. Number them first if they are not already labeled. Remove the cruise control servo from the right inner fender panel, if equipped.

4. Remove the air supply pipes from the manifold. Remove the Pulsair bracket bolt from the rocker cover, on models so equipped, then remove the pipe assembly.

5. Remove the manifold retaining bolts and remove the manifold.

6. Clean the mating surfaces of the cylinder head and manifold. Position the manifold against the head and install the retaining bolts finger tight.

7. Tighten the bolts in a circular pattern, working from the center to the ends, to 25 ft. lbs. in 2 stages.

8. Install the air supply system. Install the spark plug wires. If equipped install the cruise control servo.

9. Raise and support the vehicle safely. Connect the exhaust pipe to the manifold. Lower the vehicle.

5.9L Engine

1. Disconnect the negative battery cable. Disconnect the spark plug wires. Disconnect the air delivery hose at the distribution manifold.

2. Remove the air distribution manifold and the injection tubes. Disconnect the exhaust pipe at the manifold.

3. Remove the exhaust manifold retaining bolts along with the spark plug

Intake manifold bolt torque sequence—4.0L engine

shields. Remove the exhaust manifold from the vehicle.

4. Installation is the reverse of the removal procedure. Be sure to use a new gasket, as required. Torque the bolts to specification.

Combination Manifold

REMOVAL & INSTALLATION

4.0L Engine

NOTE: The intake and exhaust manifold are mounted externally on the left side of the engine and are attached to the cylinder head. They are removed as a unit.

1. Disconnect the negative battery cable. As required, relieve the fuel system pressure.

2. Remove the air cleaner.

3. Drain the cooling system.

4. Disconnect the EGR tube nuts at the intake manifold and exhaust manifold.

5. Disconnect the accelerator cable, cruise control cable and transmission line pressure cable.

6. Disconnect the vacuum multi-connector at the intake manifold.

7. Disconnect all wiring connectors at the manifold.

8. Disconnect the fuel supply and return lines from the fuel rail.

9. Loosen the serpentine belt tensioner.

10. Unbolt the power steering pump and bracket and set it aside. Don't disconnect the hoses.

11. Remove the fuel rail and injectors.

12. Remove the intake manifold heat shield.

13. Raise and safely support the vehicle.

14. Disconnect the exhaust pipe at the exhaust manifold.

15. Disconnect the oxygen sensor wiring at the sensor.

16. Lower the vehicle.

17. Remove the manifold attaching bolts, nuts and clamps.

18. Separate the intake manifold and exhaust manifold from the engine as an assembly, and discard the gasket.

19. If either manifold is to be replaced, they should be separated.

20. Clean the mating surface of the manifolds and the cylinder head before replacing the manifolds.

To install:

21. If the manifolds were separated, install the EGR tube loosely. Don't tighten it until the manifold assembly is installed.

22. Install a new gasket over the alignment dowels on the head.

23. Position the manifold assemblies and loosely install the bolts. Tighten the bolts in sequence as follows:

a. No. 1—30 ft. lbs.

b. No. 2 through 11—23 ft. lbs.

c. No. 12 and 13 (EGR tube)—30 ft. lbs.

24. Connect the oxygen sensor wiring at the sensor.

25. Connect the exhaust pipe at the exhaust manifold.

26. Install the intake manifold heat shield.

27. Install the fuel rail and injectors.

28. Install the power steering pump and bracket.

29. Adjust the serpentine belt tensioner.

30. Connect the fuel supply and return lines at the fuel rail. Use new O-rings at the quick-connect fittings.

31. Connect all wiring connectors at the manifold.

32. Connect the vacuum multi-connector at the intake manifold.

33. Connect the accelerator cable, cruise control cable and transmission line pressure cable.

34. Connect the EGR tube nuts at the intake manifold and exhaust manifold.

35. Drain the cooling system.

36. Install the air cleaner.

37. Connect the negative battery cable.

4.2L Engine

1. Disconnect the negative battery cable. Remove the air cleaner and carburetor.

2. Disconnect the accelerator cable from the accelerator bellcrank.

3. Disconnect the PCS vacuum hose from the intake manifold.

4. Disconnect the distributor vacuum hose and electrical wires at the TCS solenoid vacuum valve.

5. Remove the TCS solenoid vacuum valve and bracket from the intake manifold. In some cases it might not be necessary to remove the TCS unit.

6. If so equipped, disconnect the EGR valve vacuum hoses.

7. Remove the power steering mounting bracket and pump and set it aside without disconnecting the hoses.

8. Remove the EGR valve, if so equipped.

9. Disconnect the exhaust pipe from the manifold flange. Disconnect the spark CTO hoses and remove the oxygen sensor.

10. Remove the manifold attaching bolts, nuts and clamps.

11. Separate the intake manifold and exhaust manifold from the engine as an assembly. Discard the gasket.

12. If either manifold is to be replaced, they should be separated at the heat riser area.

To install:

13. Clean the mating surfaces of the manifolds and the cylinder head before replacing the manifolds. Replace them in reverse order of the above procedure with a new gasket. Tighten the bolts and nuts to the specified torque in the proper sequence.

14. Connect the exhaust pipe to the manifold flange. Torque the nuts to 20 ft. lbs. Connect the spark CTO hoses and install the oxygen sensor.

15. Install the EGR valve, if so equipped.

16. Install the power steering mounting bracket and pump.

17. If so equipped, connect the EGR valve vacuum hoses.

18. Install the TCS solenoid vacuum

valve and bracket to the intake manifold.

19. Connect the distributor vacuum hose and electrical wires at the TCS solenoid vacuum valve.

20. Connect the PCS vacuum hose to the intake manifold.

21. Connect the accelerator cable to the accelerator bellcrank.

22. Install the air cleaner and carburetor.

Timing Chain Front Cover and Seal

REMOVAL & INSTALLATION

2.5L Engine

1. Disconnect the negative battery cable. Remove the drive belts and fan shroud.

2. Unscrew the vibration damper bolts and washer.

3. Using a puller, remove the vibration damper.

4. Remove the fan assembly. If the fan is equipped with a fan clutch, the fluid will leak out of the clutch and irreversibly damage the fan, if it is layed flat.

5. Remove the air conditioning compressor/alternator bracket assem-

Timing case cover alignment and seal installation

bly and lay it out of the way. Do not disconnect the refrigerant lines.

6. Unbolt the cover from the block and oil pan. Remove the cover and front seal.

7. Cut off the oil pan side gasket end tabs and oil pan front seal tabs.

8. Clean all gasket mating surfaces thoroughly.

9. Remove the seal from the cover.

To install:

10. Apply sealer to both sides of the new case cover gasket and position it on the block.

11. Cut the end tabs off the new oil pan side gaskets corresponding to those cut off the original gasket and attach the tabs to the oil pan with gasket cement.

12. Coat the front cover seal end tab recesses generously with RTV sealant and position the side seal in the cover.

13. Apply engine oil to the seal-to-pan contact surface.

14. Position the cover on the block.

15. Insert alignment tool J-22248 or equivalent, into the crankshaft opening in the cover.

16. Install the cover bolts. Tighten the cover-to-block bolts to 5 ft. lbs.; the cover-to-pan bolts to 11 ft. lbs.

17. Remove the alignment tool and position the new front seal on the tool with the seal lip facing outward. Apply a light film of sealer to the outside diameter of the seal. Lightly coat the crankshaft with clean engine oil.

18. Position the tool and seal over the end of the crankshaft and insert the draw screw J-9163-2, or equivalent, into the installation tool.

19. Tighten the nut until the tool just contacts the cover.

20. Remove the tools and apply a light film of engine oil on the vibration damper hub contact surface of the seal.

21. With the key inserted in the keyway in the crankshaft, install the vibration damper, washer and bolt. Lu-

Timing case cover and components

Intake manifold bolt torque sequence—4.2L engine

bricate the bolt and tighten it to 108 ft. lbs.

22. Install the remaining components in the reverse order of removal.

2.8L Engine

1. Disconnect the negative battery cable.

2. Remove the drive belts.

3. Remove the fan shroud.

4. Remove the fan and pulley. If the fan is equipped with a fan clutch, the fluid will leak out and the fan clutch will have to be replaced, if the fan is layed flat.

5. Drain the cooling system.

6. Remove the air conditioning compressor and mounting bracket and position them out of the way, leave the refrigerant lines connected.

7. Remove the water pump.

8. Remove the vibration damper retaining bolt and, using a puller, remove the damper.

NOTE: On some vehicles the outer ring (weight) of the harmonic balancer is bonded to the hub with rubber. The balancer must be removed with a puller which acts on the inner hub only. Pulling on the outer portion of the balancer will break the rubber bond or destroy the tuning of the torsional damper.

9. Disconnect the lower radiator hose.

10. Unbolt and remove the cover. Pry out the seal.

To install:

11. Thoroughly remove all traces of gasket material from the mating surfaces.

12. Position a new seal in the cover with the open end of the seal facing outward.

13. Apply a $\frac{3}{32}$ in. bead of RTV silicone gasket material to the mating surfaces of the cover and block. Place the cover on the block and install the bolts. Torque the M8 $\times$ 1.25 bolts to 18 ft. lbs.; the M10 $\times$ 1.5 bolts to 30 ft. lbs. Tighten the bolts within 5 minutes, as the sealer will begin to set.

14. Install all other parts in reverse order of removal.

NOTE: Breakage may occur if the balancer is hammered back onto the crankshaft. A press or special installation tool is necessary.

4.0L and 4.2L Engines

1. Disconnect the negative battery cable. Remove the drive belts, engine fan and hub assembly, the accessory pulley and vibration damper.

2. Unbolt the air conditioning com-

Timing case cover end tabs—4.0L and 4.2L engines

pressor and bracket and set it aside. Don't disconnect the refrigerant lines.

3. Remove the oil pan to timing chain cover bolts and the bolts that attach the cover to the block.

4. Raise the timing chain cover just high enough to detach the retaining ribs of the oil pan neoprene seal from the bottom side of the cover. This must be done to prevent pulling the seal end tabs away from the tongues of the oil pan gaskets, which would cause a leak.

5. Remove the timing chain cover and gasket from the engine.

To install:

6. Use a razor blade to cut off the oil pan seal end tabs flush with the front face of the cylinder block and remove the seal. Clean the timing chain cover, oil pan, and cylinder block surfaces.

7. Remove the crankshaft oil seal from the timing chain cover. Thoroughly clean the mating surfaces.

8. Apply RTV gasket material to both sides of the new gasket and position the gasket on the block.

9. Cut the end tabs off of the replacement oil pan side gaskets, corresponding to those cut off of the original gasket. Cement the end tabs to the oil pan.

10. Coat the front cover end tab recesses with a generous amount of RTV gasket sealant and position the seal on the timing case cover. Apply a coat of clean engine oil to the seal-to-pan contact surfaces.

11. Position the case cover on the block.

12. Place cover alignment tool in the crankshaft opening of the cover.

13. Install the cover-to-block bolts and the oil pan-to-cover bolts. Torque the cover-to-block bolts to 62 inch lbs.; the cover-to-pan bolts to 11 ft. lbs.

14. Remove the alignment tool and position the seal on the tool with the lip facing outward.

15. Apply a light coat of sealer on the outside diameter of the seal.

16. Lightly coat the crankshaft with clean engine oil.

17. Position the tool and seal over the end of the crankshaft and insert a screw tool into the seal installation tool.

18. Tighten the nut against the tool until it contacts the cover.

19. Remove the tools and apply a light coating of engine oil on the vibration damper hub contact surface of the seal.

20. Install the damper.

21. Install the remaining components in reverse order of removal.

5.9L Engine

1. Disconnect the negative battery cable.

2. Drain the cooling system and disconnect the radiator hoses and bypass hose.

3. Remove all of the drive belts and the fan and spacer assembly.

4. Remove the alternator and the front portion of the alternator bracket as an assembly.

5. Disconnect the heater hose.

6. Remove the power steering pump and/or the air pump, and the mounting bracket as an assembly. Do not disconnect the power steering hoses.

7. Remove the distributor cap and note the position of the rotor. Remove the distributor.

8. Remove the fuel pump.

9. Remove the vibration damper and pulley.

10. Remove the front oil pan bolts and the bolts which secure the timing chain cover to the engine block.

NOTE: The timing gear cover retaining bolts vary in length and must be installed in the same locations from which they were removed.

11. Remove the cover by pulling forward until it is free of the locating dowel pins.

12. Clean the gasket surface of the cover and the engine block.

13. Pry out the original seal from inside the timing chain cover and clean the seal bore.

To install:

14. Drive the new seal into place from the inside with a block of wood until it contacts the outer flange of the cover.

15. Apply a light film of motor oil to the lips of the new seal.

16. Before reinstalling the timing gear cover, remove the lower locating dowel pin from the engine block. The pin is required for correct alignment of the cover and must either be reused or a replacement dowel pin installed after the cover is in position.

17. Cut both sides of the oil pan gasket flush with the engine block with a razor blade.

18. Trim a new gasket to correspond to the amount cut off at the oil pan.
19. Apply sealer to both sides of the new gasket and install the gasket on the timing case cover.

20. Install the new front oil pan seal.

21. Align the tongues of the new oil pan gasket pieces with the oil pan seal and cement them into place on the cover.

22. Apply a bead of sealer to the cut-off edges of the original oil pan gaskets.

23. Place the timing case cover into position and install the front oil pan bolts. Tighten the bolts slowly and evenly until the cover aligns with the upper locating dowel.

24. Install the lower dowel through the cover and drive it into the corresponding hole in the engine block.

25. Install the cover retaining bolts in the same locations from which they were removed. Tighten to 25 ft. lbs.

26. Assemble the remaining components in the reverse order of removal.

Timing Chain and Sprockets

REMOVAL & INSTALLATION

2.5L Engine

1. Disconnect the negative battery cable. Remove the timing case cover.
2. Rotate the crankshaft so that the timing marks on the cam and crank sprockets align next to each other.
3. Remove the oil slinger from the crankshaft.
4. Remove the cam sprocket retaining bolt and remove the sprocket and chain. The crank sprocket may also be removed at this time. If the tensioner is to be removed, the oil pan must be removed, first.
5. Prior to installation, turn the tensioner lever to the unlock (down) position.
6. Pull the tensioner block toward the tensioner to compress the spring. Hold the block and turn the tensioner lever to the lock (up) position. The camshaft sprocket bolt should be torqued to 50 ft. lbs.
7. Install the sprockets and chain together, as a unit. Make sure the timing marks are aligned.
8. Install the oil pan, slinger and timing cover.

2.8L Engine

1. Disconnect the negative battery cable. Remove the timing cover.
2. Turn the crankshaft to bring the No. 1 piston to TDC of its compression stroke. The timing marks on the crankshaft and camshaft sprockets should be aligned. With the camshaft

Timing mark alignment—2.5L engine

Timing mark alignment—2.8L engine

Timing mark alignment—4.0L and 4.2L engines

sprocket timing mark at the 12 o'clock position, the engine will be in the No. 1 cylinder firing position. With the camshaft sprocket timing mark at the 6 o'clock position, the engine will be in the No. 4 cylinder firing position.

3. Unbolt and remove the camshaft sprocket and chain. If the sprocket is stuck, it can be removed by tapping it lightly with a plastic or wood mallet.

4. Lubricate the chain and sprockets with Molykote®, or equivalent. In-

Timing mark alignment—5.9L engine

stall the cam sprocket and chain, with the marks aligned. Torque the cam sprocket bolts to 20 ft. lbs.

4.0L and 4.2L Engines

1. Disconnect the negative battery cable. Remove the drive belts, engine fan and hub assembly, accessory pulley, vibration damper and timing chain cover.
2. Remove the oil seal from the timing chain cover.
3. Remove the camshaft sprocket retaining bolt and washer.
4. Rotate the crankshaft until the timing mark on the crankshaft sprocket is closest to and in a center line with the timing pointer of the camshaft sprocket.
5. Remove the crankshaft sprocket, camshaft sprocket, and timing chain as an assembly. Disassemble the chain and sprockets.
6. Assemble the timing chain, crankshaft sprocket and camshaft sprocket with the timing marks aligned.
7. Install the assembly to the crankshaft and the camshaft. Double check the alignment by counting the number of links or pins with the sprockets positioned as illustrated. There must be 15 pins between the timing marks on both sprockets.
8. Install the camshaft sprocket retaining bolt and washer and tighten to 80 ft. lbs.
9. Install the timing chain cover and a new oil seal.
10. Install the vibration damper, accessory pulley, engine fan and hub assembly and drive belts. Tighten the belts to the proper tension.

5.9L Engine

1. Disconnect the negative battery cable. Remove the timing chain cover

and gasket. Remove the crankshaft oil slinger.

2. Remove the camshaft sprocket retaining bolt and washer, distributor drive gear and fuel pump eccentric.

3. Rotate the crankshaft until the timing mark on the crankshaft sprocket is adjacent to, and on a center line with, the timing mark on the camshaft sprocket.

4. Remove the crankshaft sprocket, camshaft sprocket and timing chain as an assembly. Disassemble the chain and sprockets.

5. Assemble the timing chain, crankshaft sprocket and camshaft sprocket with the timing marks on both sprockets aligned. Install the assembly to the crankshaft and the camshaft.

6. Install the fuel pump eccentric. The fuel pump eccentric must be installed with the stamped word **REAR** facing the camshaft sprocket.

7. Install the distributor drive gear, washer and retaining bolt. Tighten the bolt to 25–35 ft. lbs.

8. Install the crankshaft oil slinger. Install the timing chain cover using a new gasket and oil seal.

Camshaft

REMOVAL & INSTALLATION

2.5L Engine

1. Disconnect the negative battery cable. If equipped with air conditioning, properly discharge the system.

2. Drain the cooling system.

3. Remove the radiator and air conditioning condenser, if equipped.

4. Remove the fuel pump.

5. Matchmark the distributor and engine for installation. Note the rotor position by marking it on the distributor body. Unbolt and remove the distributor and wires.

6. Remove the rocker arm cover.

7. Remove the rocker arm assemblies.

8. Remove the pushrods.

NOTE: Keep all valve train components in order for installation.

9. Using tool J-21884, or equivalent, remove the hydraulic lifters.

10. Remove the timing case cover.

NOTE: If the camshaft sprocket appears to have been rubbing against the cover, check the oil pressure relief holes in the rear cam journal for debris.

11. Remove the timing chain and sprockets.

12. Slide the camshaft from the engine.

13. Installation is the reverse of removal. Inspect the camshaft for wear and damage.

14. Lubricate all moving parts with engine oil supplement. When installing the distributor, make sure that all matchmarks align.

15. Make sure that all camshaft timing marks align. It may be necessary to rotate the oil pump drive tang to facilitate installation of the distributor.

16. Torque the camshaft sprocket bolt to 50 ft. lbs.

2.8L Engine

1. Disconnect the negative battery cable. If equipped with air conditioning, properly discharge the system.

2. Drain the cooling system.

3. Remove the radiator and condenser.

4. Remove the intake manifold. Remove the fuel pump.

5. Remove the valve covers and remove the pushrods. Remove the lifters.

6. Remove the timing case cover. Remove the timing chain and sprockets.

7. Carefully slide the camshaft from the block.

8. Inspect the camshaft for wear or damage. If any journal is more than 0.025mm out of round, replace the camshaft.

9. Installation is the reverse of removal. Coat all parts with engine oil supplement, prior to installation. Whenever a new camshaft is installed, replace the oil filter and all the lifters. Torque the camshaft sprocket bolts to 20 ft. lbs.

4.0L and 4.2L Engines

1. Disconnect the negative battery cable. Drain the cooling system and remove the radiator. As required, relieve the fuel system pressure.

2. Remove the condenser and receiver/drier as a charged unit.

3. Remove the valve cover and gasket, the rocker assemblies, pushrods, cylinder head and the lifters.

NOTE: The pushrods must be replaced in their original locations.

4. Remove the drive belts, cooling fan, fan hub assembly, vibration damper and the timing chain cover.

5. Remove the distributor assembly, including the spark plug wires.

6. Remove the cylinder head.

7. Remove the valve lifters. Keep them in order for installation.

8. Rotate the crankshaft until the timing mark of the crankshaft sprocket is adjacent to, and on a center line with, the timing mark of the camshaft sprocket.

9. Remove the crankshaft sprocket, camshaft sprocket, and the timing chain as an assembly.

10. Remove the front bumper or grille as required and carefully slide out the camshaft.

To install:

11. Lubricate the camshaft with an engine oil supplement.

12. Slide the camshaft into the block carefully to avoid damage to the bearings.

13. Install the crankshaft sprocket, camshaft sprocket, and the timing chain as an assembly.

14. Make sure the timing mark of the crankshaft sprocket is adjacent to, and on a center line with, the timing mark of the camshaft sprocket. Torque the camshaft sprocket bolt to 80 ft. lbs.

15. Install the valve lifters.

16. Install the cylinder head.

17. Install the distributor assembly.

18. Install the timing chain cover, vibration damper, fan hub, cooling fan and the drive belts.

19. Install the pushrods, the rocker assemblies, valve cover and gasket.

20. Install the condenser and receiver/drier as a charged unit.

21. Install the radiator. Recharge the air conditioning.

22. Fill the cooling system.

5.9L Engine

1. Disconnect the negative battery cable.

2. Drain the radiator and both banks of the block. Remove the lower hose at the radiator, the bypass hose at the pump, the thermostat housing and the radiator. If equipped with air conditioning, remove the condenser and receiver assembly.

3. Remove the distributor, all wires, and the coil from the manifold.

4. Remove the intake manifold as an assembly.

5. Remove the valve covers, rocker arms and pushrods.

6. Remove the lifters.

NOTE: The valve train components must be replaced in their original locations.

7. Remove the cooling fan and hub assembly, fuel pump, and heater hose at the water pump.

8. Remove the alternator and bracket as an assembly. Move it aside, do not disconnect the wiring.

9. Remove the crankshaft pulley and the damper. Remove the lower radiator hose at the water pump.

10. Remove the timing chain cover.

11. Remove the distributor/oil pump drive gear, fuel pump eccentric, sprockets and the timing chain.

12. Remove the grille.

13. Remove the camshaft carefully by sliding it forward out of the engine.

To install:

14. Coat all parts with engine oil supplement.
15. Slide the camshaft, carefully, into the engine.
16. Install the grille.
17. Install the distributor/oil pump drive gear, fuel pump eccentric, sprockets and the timing chain. Install the timing chain cover.
18. Install the crankshaft pulley and the damper.
19. Install the lower radiator hose at the water pump. Install the alternator and bracket as an assembly.
20. Install the cooling fan and hub assembly. Install the fuel pump.
21. Install the heater hose at the water pump. Install the lifters.

NOTE: The valve train components must be replaced in their original locations.

22. Install the valve covers, rocker arms and pushrods.
23. Install the intake manifold as an assembly.
24. Install the distributor, all wires, and the coil on the manifold.
25. Install the radiator.
26. If equipped with air conditioning, install the condenser and receiver assembly.
27. Install the thermostat and housing. Install the by-pass hose at the pump.
28. Install the lower hose at the radiator. Fill the cooling system.
29. Connect the negative battery cable.

Piston and Connecting Rod

POSITIONING

Piston positioning—all engines except 5.9L engine

Piston positioning—5.9L engine

DIESEL ENGINE MECHANICAL

NOTE: Disconnecting the battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is disconnected.

Engine

REMOVAL & INSTALLATION

2.1L Engine

1. Disconnect the battery cables and remove the battery. Remove the hood.
2. If equipped, remove the skid plate.
3. Drain the radiator. Remove the air cleaner assembly.
4. If equipped, discharge the air conditioning system.
5. Disconnect the radiator hoses and remove the E-clip from the bottom of the radiator.
6. Raise and support the vehicle safely. Drain the engine oil. If the vehicle is equipped with an automatic transmission, disconnect the oil cooler lines at the radiator.
7. Remove the splash shield from the oil pan. Lower the vehicle.
8. Loosen the radiator shroud and remove the radiator fan assembly. Remove the shroud and the splash shield.
9. Remove the radiator and the condenser assembly from the vehicle. Remove the inner cooler.
10. Remove the exhaust shield from the manifold. Disconnect the hoses at the remote oil filter. Remove the oil filter.
11. Tag and disconnect all vacuum hoses and electrical connections. Disconnect and plug the fuel inlet and outlet lines at the fuel pump.
12. If equipped with automatic transmission, remove the left motor mount through bolt retaining nut.
13. Remove the motor mount retaining bolts. Disconnect the accelerator cable. Raise and support the vehicle safely.
14. Disconnect and drain the power steering hoses at the power steering pump.
15. Disconnect the exhaust pipe at the exhaust manifold. Remove the motor mount retaining nuts.
16. Support the engine. Remove the left motor mount bolts. On automatic transmission equipped vehicles, remove the left motor mount.

17. Remove the starter.

18. If the vehicle is equipped with an automatic transmission, mark and remove the converter-to-drive plate bolts through the starter opening. Install the left motor mount and retaining bolts finger tight. Install the motor mount cushion through bolt. Remove the engine support.

19. Remove the accessible transmission-to-engine retaining bolts.

20. Lower the vehicle. Remove the remaining engine-to-transmission retaining bolts.

21. Remove the power steering pump from the engine. Remove the oil separator and disconnect the hoses. Disconnect the heater hoses.

22. Remove the reference pressure regulator from the dash panel. Install the engine lifting device and position a jack under the transmission.

23. Remove the engine from the vehicle.

To install:

24. Lower the engine into the vehicle.

NOTE: It may be necessary to remove the engine mount cushions to ease alignment of the engine.

25. On vehicles with a manual transmission, slide the transmission input shaft into the clutch splines, align the flywheel housing bolt holes and install the lower bolts finger tight.

26. On vehicles with an automatic transmission, align the torque converter housing and engine and install the lower bolts finger tight.

27. Install all remaining bolts. Torque all bolts to 30 ft. lbs. Install any engine mount cushions previously removed.

28. Remove the engine lifting device.

29. If the vehicle is equipped with automatic transmission, install the converter-to-drive plate bolts through the starter opening. Torque the bolts to 40 ft. lbs.

30. Install the starter. Tighten all engine mount bolts to 30 ft. lbs.

31. Install the power steering pump. Tighten the rear bracket-to-block bolt to 20 ft. lbs.; all other bolts to 28 ft. lbs.

32. Connect the exhaust pipe at the exhaust manifold. Install the oil filter and lines.

33. Install the oil separator and connect the hoses. Connect the heater hoses.

34. Connect all vacuum hoses and electrical connections. Connect the fuel inlet and outlet lines at the fuel pump.

35. Install the reference pressure regulator from the dash panel.

36. Connect the accelerator cable. Install the exhaust shield at the manifold.

37. Install the radiator and the condenser assembly from the vehicle. Install the inner cooler.

38. Install the radiator fan assembly. Install the shroud and the splash shield. Install the splash shield on the oil pan.

39. If the vehicle is equipped with automatic transmission connect the oil cooler lines at the radiator.

40. Connect the radiator hoses and install the E-clip at the bottom of the radiator.

41. Install the air conditioning compressor. Evacuate, charge and leak test the air conditioning system.

42. Fill the cooling system. Install the air cleaner assembly. If equipped, install the skid plate. Install the battery.

43. Install the hood.

Cylinder Head

REMOVAL & INSTALLATION

2.1L Engine

1. Disconnect the negative battery cable. Drain the engine coolant.

2. Remove the intake manifold. Remove the exhaust manifold.

3. Remove the valve cover. Remove the timing belt cover.

4. Install sprocket holding tool MOT-854 or equivalent and remove the camshaft sprocket retaining bolt. Remove the special tool.

5. Loosen the bolts and move the tensioner away from the timing belt. Retighten the tensioner bolts.

6. Remove the timing belt from the sprockets.

NOTE: If it is necessary to remove the fuel injection pump sprocket use special tool BVI-28-01 or BVI-859, or their equivalents to accomplish this procedure.

7. Disconnect the fuel pipe fittings from the injectors. Plug them in order to prevent dirt from entering the system.

8. Disconnect the fuel pipe fittings from the fuel injection pump. Plug them in order to prevent dirt from entering the system.

9. Remove the fuel pipes from their mountings on the engine. Remove all hoses and connectors from the fuel injection pump.

10. Remove the injection pump retaining bolts. Remove the fuel injection pump and its mounting brackets, as an assembly, from the vehicle.

11. Remove the retaining bolts and nuts from the cylinder head. Loosen pivot bolt but do not remove it. Remove the remaining cylinder head bolts.

Cylinder head bolt torque sequence—2.1L turbo diesel engine

12. Place a block of wood against the cylinder head and tap it with a hammer in order to loosen the cylinder head gasket. The pivot movement will be minimal due to the small clearance between the studs and the cylinder head. Remove the pivot bolt from the cylinder head.

13. Remove the retaining bolts and the rocker arm shaft assembly from the cylinder head.

NOTE: Do not lift the cylinder head from the cylinder block until the gasket is completely loosened from the cylinder liners. Otherwise, the liner seals could be broken.

14. Remove the cylinder head and the gasket from the engine block. While the head is off, install liner clamp tool MOT. 521-01 to hold the liners in place in the block.

To install:

15. Position cylinder head locating tool MOT-720 on the block to insure proper alignment.

16. Remove liner clamp tool MOT 521-01.

17. Position the cylinder head and the new gasket from the engine block. Be sure that the new cylinder head gasket is positioned properly on the cylinder head and that it is the correct thickness for piston protrusion. Whenever major components, such as pistons, liners, crankshaft, etc., have been replaced, the piston protrusion must be measured to determine proper replacement head gasket thickness. Measure the protrusion as follows:

a. Rotate the crankshaft one complete revolution clockwise and bring No. 1 piston to a point just below and before TDC.

b. Place thrust plate tool MOT. 252-01 on top of the piston.

c. Assemble dial indicator LM in block gauge MOT. 251-01 and place this assembly on one side of the thrust plate.

d. Zero the indicator with the stem on the cylinder block face.

e. Place the stem on the top of the piston and rotate the crankshaft clockwise to TDC of the piston. Record the piston travel.

f. Repeat the procedure with the

dial indicator on the opposite side of the block. Record the piston travel.

g. Add the figures together and divide by 2. Repeat the protrusion measurement for the 3 remaining pistons. The piston with the greatest protrusion should be the basis for determining gasket thickness. For example, if the amount of greatest piston protrusion is:

Less than 0.96mm, use a gasket 1.6mm thick

Between 0.96mm and 1.04mm, use a 1.7mm thick gasket

More than 1.04mm, use a 1.8mm thick gasket

18. Install the head bolts. Torque the cylinder head retaining bolts to 22 ft. lbs., then to 37 ft. lbs., then to 70-77 ft. lbs. Once all the bolts are tightened, recheck the torque.

NOTE: The cylinder head bolts must be retightened after the cylinder head is installed in the vehicle. Operate the engine for a minimum of 20 minutes. Allow the engine to cool for a minimum of 2½ hours. Loosen each cylinder head bolt in sequence about ½ turn. Then retighten in the proper sequence and torque to 70-77 ft. lbs. For the final tightening, tighten the bolts again, in sequence, without loosening them to 70-77 ft. lbs.

19. Remove tool MOT-720.

20. Install the rocker arm shaft assembly.

21. Install the fuel injection pump and its mounting brackets, as an assembly.

22. Install the fuel pipes on their mountings on the engine. Install all hoses and connectors on the fuel injection pump.

23. Connect the fuel pipe fittings to the fuel injection pump.

24. Connect the fuel pipe fittings from the injectors.

25. Install the timing belt. Retension the timing belt. Install the camshaft sprocket retaining bolt.

26. Install the valve cover. Install the timing belt cover. Install the intake manifold.

27. Install the exhaust manifold.

28. Fill the cooling system.

29. Connect the negative battery cable.

Valve Lash

ADJUSTMENT

1. Remove the valve cover.
2. Loosen the locknut and turn the adjustment screw as necessary.
3. As each adjustment screw is tightened, be sure that the bottom of the screw is aligned with the valve stem. If the adjustment screw is not aligned with the stem when tightened, the stem could bend. Tighten the locknut.
4. The exhaust valve adjustment specification is 0.25mm. The intake valve adjustment specification is 0.20mm.
5. Install the valve cover.

Rocker Arms/Shaft

REMOVAL & INSTALLATION

2.1L Engine

1. Disconnect the negative battery cable.
2. Remove the cylinder head cover and gasket.
3. Remove the rocker shaft retaining bolts. Remove the rocker arm shaft assembly from the vehicle.
4. Installation is the reverse of the removal procedure. Be sure to use new gaskets and adjust the valves as required. Torque the bolts to 20 ft. lbs.
5. Be sure that the engine is cold before adjusting the valves.
6. Set number one cylinder to TDC on the compression stroke and check the valve clearance of No.1 and No.2 intake and No.1 and No.3 exhaust valves. Adjust as required.
7. Rotate the crankshaft 360 degrees and check the clearance of the No. 3 and No. 4 intake and No. 2 and No. 4 exhaust valves. Adjust as required.

NOTE: The No. 1 cylinder is located at the flywheel end of the engine.

8. To adjust, loosen the locknut and turn the adjustment screw as necessary. As each adjustment screw is tightened, be sure that the bottom of the screw is aligned with the valve stem. If the adjustment screw is not aligned with the stem when tightened, the stem could bend. Tighten the locknut.

9. The exhaust valve adjustment specification is 0.25mm. The intake valve adjustment specification is 0.20mm.

Rocker arm identification—used for clearance adjustment

Intake Manifold

REMOVAL & INSTALLATION

2.1L Engine

1. Disconnect the negative battery cable. Disconnect the air inlet hose at the intake manifold.
2. Tag and remove all hoses and/or wires as necessary in order to gain access to the intake manifold retaining bolts.
3. Tag and remove all vacuum hoses and electrical connections that are attached to the intake manifold.
4. Remove the intake manifold retaining bolts. Remove the assembly from the vehicle. Discard the intake manifold gaskets.
5. Installation is the reverse of removal.

Exhaust Manifold

REMOVAL & INSTALLATION

2.1L Engine

1. Disconnect the negative battery cable. Remove the intake manifold.
2. Disconnect the exhaust pipe from the adapter.
3. Remove the oil supply pipe and the oil return hose from the turbocharger assembly.
4. Disconnect the turbocharger air inlet and outlet hoses.
5. Remove the turbocharger retaining bolts. Remove the turbocharger from the vehicle.
6. Remove the exhaust manifold re-

taining bolts. Remove the exhaust manifold and gasket. Discard the gasket.

7. Installation is the reverse of removal. Torque the bolts to specification.

Turbocharger

REMOVAL & INSTALLATION

2.1L Engine

1. Disconnect the negative battery cable.
2. Remove all the necessary components in order to gain access to the turbocharger retaining bolts.
3. Disconnect the exhaust pipe flange. Remove the oil supply pipe. Remove the oil return hose.
4. Remove the turbocharger retaining bolts. Remove the turbocharger from the vehicle.
5. Installation is the reverse of removal. Torque the turbocharger support bracket bolts to 30 ft. lbs.

Timing Belt Cover

REMOVAL & INSTALLATION

2.1L Engine

1. Disconnect the negative battery cable.
2. Remove all necessary components in order to gain access to the timing belt cover bolts.
3. Remove the timing belt cover retaining bolts. Remove the timing belt cover from the engine.

Timing gear cover—2.1L turbo diesel engine

TENSIONER

Timing belt tensioner bolt location—2.1L turbo diesel

4. Installation is the reverse of removal.

Timing Belt and Tensioner

REMOVAL & INSTALLATION

2.1L Engine

1. Disconnect the negative battery cable.
2. Remove the timing belt cover.
3. Install sprocket holding tool MOT-854 or equivalent and remove the camshaft sprocket retaining bolt. Remove the special tool.
4. Loosen the bolts and move the chain tensioner away from the timing belt. Tighten the tensioner bolts.
5. Remove the timing belt from the sprockets. Inspect the belt for excess wear, splits or fraying.
6. If it is necessary to remove the fuel injection pump sprocket, use tools BVI-28-01 and BVI-859, or equivalent.

To install:

7. Remove the access plug in the block, on the left side, and install the holding tool, MOT-861 in the hole. Rotate the crankshaft slowly, clock-

Camshaft and injection pump timing marks aligned—2.1L turbo diesel

wise, until the tool drops into the TDC locating slot in the crankshaft counterweight.

NOTE: Don't use this tool as a crankshaft holding tool. When tightening or loosening gear train fasteners, use a flywheel holding tool, such as tool MOT-582.

8. Install sprocket holding tool, MOT-854 to retain the camshaft and injection pump sprockets. Make sure that the timing marks are positioned correctly.
9. Install the timing belt. There

should be a total of 19 belt teeth between the camshaft and injection pump timing marks.

10. Temporarily position the timing cover over the sprockets. The camshaft and injection pump timing marks must index with the pointers in the cover's timing slots.

11. Remove the cover.

12. Remove the holding tool, MOT-854.

13. Make sure that the timing belt tensioner bolts are $\frac{1}{2}$ turn loose, maximum.

14. The tensioner should, automatically, bear against the belt, giving the proper belt tension. Tighten the tensioner bolts.

15. Remove the TDC locating tool and install the plug.

16. Rotate the crankshaft, slowly, clockwise, 2 complete revolutions.

NOTE: Never rotate the crankshaft counterclockwise while adjusting belt tension.

17. Loosen the tensioner bolts $\frac{1}{2}$ turn, maximum, then tighten.

18. Check the belt deflection at a point midway between the camshaft and injection pump sprockets. The belt should deflect 3–5mm.

19. Install the timing belt cover.

Camshaft

REMOVAL & INSTALLATION

2.1L Engine

1. Disconnect the negative battery cable.
2. Drain the cooling system. Remove the valve cover. Remove the timing belt cover.
3. Remove the cylinder head. Remove the rocker arm shaft. Remove the camshaft gear.
4. Remove the oil seal from the cylinder head by prying it out using a suitable tool. Remove the camshaft from the cylinder head.
5. Installation is the reverse of removal. Always use a new front seal. Hold the sprocket with holding tool MOT-855, or equivalent, while tightening the nut. Torque the nut to 37 ft. lbs.

ENGINE LUBRICATION

Oil Pan

REMOVAL & INSTALLATION

2.1L Engine

1. Disconnect the negative battery

cable. Raise and support the vehicle safely. Remove the converter housing shield, as required.

2. Drain the engine oil. This engine has 2 oil drain plugs, both must be opened.

3. Remove all the necessary components in order to gain access to the oil pan retaining bolts.

4. Remove the oil pan retaining bolts. Remove the oil pan from the engine.

5. Installation is the reverse of removal. Torque the bolts to 79 inch lbs.

2.5L Engine

1. Disconnect the negative battery cable.

2. Raise and support the vehicle safely.

3. Drain the oil.

4. Disconnect the exhaust pipe at the manifold.

5. Remove the starter.

6. Remove the bellhousing access plate.

7. Unbolt and remove the oil pan.

8. Clean the gasket surfaces thoroughly.

9. Install a replacement seal at the bottom of the timing case cover and at the rear bearing cap.

10. Using new gaskets coated with sealer, install the pan and torque the $\frac{1}{4}$ -20 bolts to 84 inch lbs.; the $\frac{5}{16}$ -18 bolts to 11 ft. lbs.

11. Install the remaining components in the reverse order of removal.

2.8L Engine

1. Disconnect the negative battery cable.

2. Raise and safely support the vehicle.

3. Drain the oil.

4. Remove the bellhousing access cover.

5. Disconnect the left exhaust pipe at the manifold.

6. Remove the starter.

7. Disconnect the exhaust pipe at the converter flange.

8. Unbolt and remove the pan.

9. Remove all RTV gasket material.

To install:

10. Install a new rear pan seal.

11. Apply a 3mm bead of RTV gasket material all the way around the pan sealing surface.

12. Install the pan and torque the bolts to 12 ft. lbs.

13. Connect the exhaust pipe at the converter flange.

14. Install the starter.

15. Connect the left exhaust pipe at the manifold.

16. Install the bell housing access cover.

17. Refill the engine with oil and connect the negative battery cable.

4.0L, 4.2L and 5.9L Engines

1. Disconnect the negative battery cable. Raise and safely support the vehicle.

2. Drain the engine oil.

3. Remove the starter motor.

4. Remove all of the oil pan attaching bolts and remove the oil pan.

5. Remove the oil pan front and rear oil seals and side gaskets.

To install:

6. Thoroughly clean the gasket surfaces of the oil pan and engine block.

7. When installing the front oil pan seal to the timing chain cover, apply a generous amount of Permatex® No. 2 to the end tabs. Also, cement the oil pan side gaskets to the mating surface on the bottom of the engine block. Coat the inside curved surface of the new oil pan rear seal with soap and apply a generous amount of Permatex® No. 2 to the gasket contacting surface of the seal end tabs.

8. Install the seal in the recess of the rear main bearing cap, making certain that it is fully seated.

9. Apply engine oil to the oil pan contacting surface of the front and rear oil pan seals.

10. Install the oil pan. Torque the $\frac{1}{4}$ × 20 bolts to 80 inch lbs.; the $\frac{5}{16}$ × 18 bolts to 11 ft. lbs.

11. Install the starter motor.

12. Fill the crankcase with oil and connect the negative battery cable.

2. Remove the vacuum pump along with the oil pump drive gear.

3. Remove the timing belt cover. Loosen the intermediate shaft drive sprocket using tool MOT-855 or equivalent.

4. Remove the intermediate shaft bolt, sprocket, cover, clamp plate and intermediate shaft.

5. Raise and support the vehicle safely. Drain the engine oil. Remove the oil pan.

6. Remove the piston skirt cooling oil jet assembly to oil pump pipe.

7. Remove the oil pump retaining bolts. Remove the oil pump.

To install:

8. Be sure that the oil pump locating dowels are in place on the pump.

9. Inspect the gears for abnormal wear, chips, looseness on the shafts, galling, and scoring.

10. Inspect the cover and cavity for breaks, cracks, distortion, and abnormal wear.

11. Install the gears into the pump cavity, and with the use of a straight edge and feeler gauge, check the gear to housing clearance.

12. Repair or replace defective components as required.

13. Installation is the reverse of the removal procedure. Be sure to use new gaskets and seals as required. Torque the pump mounting bolts to 33 ft. lbs.

2.5L Engine

1. Disconnect the negative battery cable. Raise and safely support the vehicle.

2. Drain the engine oil and remove the oil pan.

3. Unbolt and remove the pump assembly from the block. Discard the gasket.

Oil pump and skirt cooling jet assembly mounting—2.1L turbo diesel

4. Using a new gasket, install the pump on the block. Torque the short bolt to 10 ft. lbs. and the long bolt to 17 ft. lbs.

5. Install the oil pan.

6. Connect the negative battery cable.

2.8L Engine

1. Disconnect the negative battery cable. Raise and safely support the vehicle.

2. Drain the engine oil and remove the oil pan.

3. Unbolt and remove the pump from the extension housing.

4. Using a new gasket, install the pump on the block. Torque the bolts to 25-30 ft. lbs.

5. Install the oil pan.

6. Connect the negative battery cable.

4.0L, 4.2L and 5.9L Engine

1. Disconnect the negative battery cable. Raise and safely support the vehicle.

2. Drain the oil and remove the oil pan.

3. Remove the oil pump retaining bolts and separate the oil pump and gasket from the engine block.

NOTE: Do not disturb the position of the oil pick-up tube and screen assembly in the pump body. If the tube is moved within the pump body, a new assembly must be installed to assure an airtight seal.

4. Using a new gasket, install the pump on the block. Torque the short bolt to 10 ft. lbs. and the long bolt to 17 ft. lbs.

5. Install the oil pan.

6. Connect the negative battery cable.

Gear-to-Body Clearance Check

1. With both oil pump gears in the body, check the clearance by inserting a feeler gauge between a gear tooth and the pump body.

2. Rotate the gears to measure each tooth to body clearance.

3. The correct tooth to body clearance is:

a. 2.1L diesel engine—0.0019–0.0047 in. (0.05–0.12 mm)

b. 2.5L, 4.0L and 4.2L engine—0.002–0.004 in. (0.051–0.102 mm)

c. 5.9L engine—0.0005–0.0025 in. (0.013–0.064 mm)

Rear Main Bearing Oil Seal

REMOVAL & INSTALLATION

2.5L Engine

1. Remove the engine.

Checking oil pump gear tooth to body clearance

Rear main seal installation—2.5L engine

Installing the rear main seal on the installation tool—2.5L engine

Removing the rear main seal 2.5L engine

2. Remove the flywheel.
3. Using a sharp awl, punch a hole in the seal and pry it out of its bore.
4. Thoroughly clean the bore.
5. Coat the outer edge of the new seal with sealer and the inner sealing surface with clean engine oil.

Two piece rear main seal installation

6. Using a seal driver, such as Mot-788, or equivalent drive the new seal into place.

7. Install the flywheel.

8. Install the engine.

2.5L Engine

1. Remove the transmission.

2. Remove the flywheel.

3. Pry out the seal from around the crankshaft flange.

4. Coat the inner lip of the new seal with clean engine oil.

5. Gently tap the new seal into place, flush with the block, using a rubber or plastic mallet.

6. Install the flywheel and install the transmission.

2.8L Engine

1. Remove the oil pan and pump.

2. Remove the rear main bearing cap.

3. Gently pack the upper seal into the groove approximately 1/4 in. on each side.

4. Measure the amount the seal was driven in on one side and add 1/16 in. Cut this length from the old lower cap seal. Be sure to get a sharp cut. Repeat for the other side.

5. Place the piece of cut seal into the groove and pack the seal into the block. Do this for each side.

NOTE: GM makes a guide tool (J-29114-1) which bolts to the block via an oil pan bolt hole, and a packing tool (J-29114-2) which are machined to provide a built-in stop for the installation of the short cut pieces. Using the packing tool, work the short pieces of seal onto the guide tool, then pack them into the block with the packing tool.

6. Install a new lower seal in the rear main cap.

7. Install a piece of Plastigage® or the equivalent on the bearing journal. Install the rear cap and tighten to 70 ft. lbs. Remove the cap and check the gauge for bearing clearance. If out of specification, the ends of the seal may be frayed or not flush, preventing the cap from proper sealing. Correct as required.

8. Clean the journal, and apply a thin film of RTV silicone sealer to the mating surfaces of the cap and block. Do not allow any sealer to get onto the journal or bearing. Install the bearing cap and tighten to 70 ft. lbs. Install the pan and pump.

4.0L, 4.2L and 5.9L Engines

1. Remove the transmission.
2. Remove the flywheel or flexplate.
3. Pry the seal out from around the crankshaft flange.
4. Remove the rear main bearing cap and wipe clean the cap and crankshaft seal surfaces.
5. Apply a thin coat of engine oil to the seal surfaces of the cap and crankshaft.
6. Coat the lip of each seal half with clean engine oil.
7. Position the upper seal half in the block. The lip of the seal faces the front of the engine.
8. Coat both side of the lower seal's end tabs with RTV silicone gasket material. Don't get any on the seal lip.
9. Coat the outer, curved surface of the lower seal with soap.
10. Seat the lower seal firmly in the bearing cap recess.
11. Coat both chamfered edges of the bearing cap with RTV silicone gasket material.

NOTE: Avoid getting and RTV material on the bearing cap-to-block mating surfaces. Doing so would change the bearing cleanace.

12. Install the bearing cap.
13. Torque all the main bearing caps to 80 ft. lbs.

MANUAL TRANSMISSION

Transmission Assembly

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

REMOVAL & INSTALLATION

2WD Vehicles

1. Disconnect the negative battery cable. Raise the outer gearshift lever boot and remove the upper part of the console.
2. Remove the lower part of the console.

3. Remove the inner boot.
4. Remove the gearshift lever.
5. Raise and safely support the vehicle.
6. Drain the transmission oil.
7. Matchmark the driveshaft and yoke for installation alignment.
8. Unbolt and remove the driveshaft.
9. Position a suitable jack under the transmission and take the weight off the transmission slightly.
10. Unbolt and remove the rear crossmember.
11. Disconnect the speedometer cable.
12. Disconnect the back-up light switch.
13. Disconnect all linkage and hoses from the transmission.
14. Unbolt the transmission from the engine and lower the transmission while pulling it back.

To install:

15. Lightly grease the input shaft splines.
16. Raise the transmission into position.
17. Roll the transmission forward and engage the input shaft and clutch disc spline. Wiggle the output shaft yoke to get the splines to mesh. Once the splines mesh, push the transmission forward all the way and align the bellhousing-to-engine bolt holes. Install the attaching bolts and torque them to 28 ft. lbs.
18. Connect all linkage and hoses at the transmission.
19. Connect the back-up light switch.
20. Connect the speedometer cable.
21. Install the rear crossmember. Torque the crossmember attaching bolt to 30 ft. lbs.; the transmission to crossmember bolts to 33 ft. lbs.
22. Remove the transmission jack.
23. Install the driveshaft. New strap bolts should be used whenever the driveshaft is disconnected. Torque the nuts to 14 ft. lbs.
24. Fill the transmission to the correct level with transmission oil.
25. Lower the vehicle.
26. Install the gearshift lever and install the inner boot. Install the lower part of the console. Install the upper part of the console.
27. Connect the negative battery cable.

4WD Vehicles

1. Disconnect the negative battery cable. Raise the outer gearshift lever boot and remove the upper part of the console.
2. Remove the lower part of the console.
3. Remove the inner boot.
4. Remove the gearshift lever.
5. Raise and safely support the vehicle.

Gearshift and console removal—4WD vehicles

6. Drain the transmission and transfer case.
7. Matchmark the rear driveshaft and yoke for installation alignment.
8. Unbolt and remove the rear driveshaft.
9. Position a suitable jack under the transmission and take up the weight slightly.
10. Unbolt and remove the rear crossmember.
11. Disconnect the speedometer cable.
12. Disconnect the back-up light switch.
13. Disconnect the transfer case vent hose at the case.
14. Disconnect all linkage and hoses from the transfer case and transmission.
15. Matchmark the front driveshaft and yoke.

16. Remove the front driveshaft.
17. Support the transmission to the jack.

18. Unbolt the transmission/transfer case assembly from the engine and lower the jack while pulling back.

To install:

19. If the transmission and transfer case were separated, torque the bolts to 26 ft. lbs.

20. Lightly grease the input shaft splines.

21. Raise the transmission into position.

22. Roll the transmission forward and engage the input shaft and clutch disc spline. Wiggle the output shaft yoke to get the splines to mesh. Once the splines mesh, push the transmission forward all the way and align the bellhousing-to-engine bolt holes. Install the attaching bolts and torque them to 28 ft. lbs.

23. Install the front driveshaft. New strap bolts should be used every time the driveshaft is disconnected. Torque the strap bolt nuts to 14 ft. lbs.; the flange-to-transfer case bolts to 35 ft. lbs.

24. Connect all linkage and hoses at the transfer case and transmission.

25. Connect the transfer case vent hose at the case.

26. Connect the back-up light switch.

27. Connect the speedometer cable.

28. Install the rear crossmember.

Torque the crossmember attaching bolts to 30 ft. lbs.; the transmission-to-crossmember bolts to 33 ft. lbs.

29. Remove the floor jack.

30. Install the rear driveshaft. Use new strap bolts. Torque the strap bolt nuts to 14 ft. lbs.; the flange-to-transfer case bolts to 35 ft. lbs.

31. Fill the transmission and transfer case.

32. Lower the vehicle.

33. Install the gearshift lever and the inner boot.

34. Install the lower part of the console and the upper part of the console.

35. Connect the negative battery cable.

CLUTCH

Clutch Assembly

REMOVAL & INSTALLATION

1. Remove the transmission or transmission/transfer case assembly.

2. Matchmark the pressure plate and flywheel. Loosen the pressure plate bolts, a little at a time, in rotation, to avoid warpage.

3. Remove the pressure plate and clutch disc.

4. Remove the pilot bushing wick from the bushing bore. Soak the wick in clean engine oil.

5. Installation is the reverse of removal. A clutch aligning tool, either store-bought, or made from an old transmission input shaft, must be used to align the clutch properly for installation. The pressure plate bolts must be tightened a little at a time, in rotation, to avoid warpage. Torque the pressure plate bolts to:

2.1L diesel engine: 16 ft. lbs.

2.5L and 2.8L engine: 23 ft. lbs.

4.0L, 4.2L and 5.9L engine: 40 ft. lbs.

Clutch Master Cylinder

REMOVAL & INSTALLATION

1. Disconnect the hydraulic line at the master cylinder. Cap the line.

2. Disconnect the pushrod at the clutch pedal.

3. Unbolt the master cylinder from the firewall.

4. Installation is the reverse of removal. Torque the mounting nuts to 19 ft. lbs. Refill and bleed the system.

Clutch Slave Cylinder

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Disconnect the hydraulic line at the cylinder. Cap the line.

3. Unbolt and remove the slave cylinder from the clutch housing.

4. Installation is the reverse of removal. Torque the mounting bolts to 16 ft. lbs. Refill and bleed the system.

Bleeding the Hydraulic Clutch System

1. Fill the clutch reservoir with clean brake fluid.
2. Raise and safely support the vehicle.
3. Remove the slave cylinder from the clutch housing, but do not disconnect the hydraulic line.
4. Remove the slave cylinder pushrod.
5. Using a wood dowel, compress the slave cylinder plunger.
6. Attach one end of a rubber hose to the slave cylinder bleeder screw and place the other end in a glass jar, filled halfway with clean brake fluid. Make sure that the hose will stay submerged.
7. Loosen the bleeder screw.
8. Have an assistant press and hold the clutch pedal to the floor. Tighten the bleeder screw with the pedal at the floor. Bubbles will have appeared in the jar when the pedal was depressed.
9. Release pedal, then perform the sequence again, until bubbles no longer appear in the jar.
10. Install the slave cylinder and lower the vehicle. Test the clutch.

AUTOMATIC TRANSMISSION

Transmission Assembly

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

REMOVAL & INSTALLATION

2WD Vehicles

1. Disconnect the negative battery cable. Raise and support the vehicle safely.
2. Matchmark the rear driveshaft and yoke for reassembly. Disconnect and remove the rear driveshaft.
3. Remove the torque converter inspection cover. Mark the converter drive plate and converter assembly for reassembly.
4. Remove the bolts attaching the torque converter to the flex plate. Support the transmission assembly using a suitable jack.
5. Remove the bolts attaching the rear crossmember to the transmission side rail. Disconnect the exhaust pipe at the catalytic converter.

6. Lower the transmission slightly in order to disconnect the fluid cooler lines.

7. Disconnect the backup light switch wire and the speedometer cable. Disconnect the transmission linkage.

8. Remove the bolts attaching the transmission assembly to the engine. Move the transmission assembly and the torque converter rearward to clear the crankshaft.

9. Carefully lower the transmission assembly from the vehicle.

To install:

10. Carefully raise the transmission into position.

11. Install the bolts attaching the transmission assembly to the engine. Torque the bolts to 25 ft. lbs. for the 904. On the AW-4, torque the 10mm bolts to 25 ft. lbs.; the 12mm bolts to 42 ft. lbs.

12. Connect the backup light switch wire.

13. Connect the speedometer cable.

14. Connect the transmission linkage.

15. Connect the fluid cooler lines.

16. Install the rear crossmember. Torque the crossmember bolts to 30 ft. lbs.; the transmission-to-crossmember bolts to 33 ft. lbs.

17. Connect the exhaust pipe at the catalytic converter.

18. Install the bolts attaching the torque converter to the flex plate. Torque the bolts to 40 ft. lbs.

19. Remove the transmission jack.

20. Install the torque converter inspection cover.

21. Install the driveshaft. New strap bolts should be used everytime the driveshaft is disconnected. Torque the nuts to 14 ft. lbs.

22. Lower the truck.

23. Connect the negative battery cable.

4WD Vehicles

1. Disconnect the negative battery cable. Raise and support the vehicle safely.

2. Matchmark the rear driveshaft and yoke for reassembly. Disconnect and remove the rear driveshaft.

3. Remove the torque converter inspection cover. Mark the converter drive plate and converter assembly for reassembly.

4. Remove the bolts attaching the torque converter to the flex plate. Support the transmission assembly with a jack.

NOTE: If the vehicle is equipped with a diesel engine, support the engine with a jack under the crankshaft damper, and remove the left motor mount and starter in order to gain access to

the torque converter drive plate bolts through the starter opening.

5. Remove the bolts attaching the rear crossmember to the transmission side rail. Disconnect the exhaust pipe at the catalytic converter.

6. Lower the transmission slightly in order to disconnect the fluid cooler lines. Matchmark the front driveshaft assembly for installation. Disconnect the driveshaft at the transfer case and secure the assembly out of the way.

7. Disconnect the backup light switch wire and the speedometer cable. Disconnect the transfer case and the transmission linkage. Disconnect the vacuum lines and the vent hose.

8. Remove the bolts attaching the transmission assembly to the engine. Move the transmission assembly and the torque converter rearward to clear the crankshaft.

9. Carefully lower the transmission assembly from the vehicle. Remove the transfer case retaining bolts from the transmission assembly.

To install:

10. If the transmission and transfer case were separated, re-attach them and torque the bolts to 26 ft. lbs.

11. Carefully raise the transmission into position.

12. Install the bolts attaching the transmission assembly to the engine. Torque the bolts to 25 ft. lbs. for the 904. On the AW-4, torque the 10mm bolts to 25 ft. lbs.; the 12mm bolts to 42 ft. lbs.

13. Connect the backup light switch wire and the speedometer cable.

14. Connect the transfer case and the transmission linkage.

15. Connect the vacuum lines and the vent hose.

16. Connect the fluid cooler lines.

17. Connect the driveshaft at the transfer case. New strap bolts should be used whenever the driveshaft is disconnected. Torque the strap bolt nuts to 14 ft. lbs.; the flange-to-case bolts to 35 ft. lbs.

18. Install the rear crossmember. Torque the crossmember attaching bolts to 30 ft. lbs.; the transmission-to-crossmember bolts to 33 ft. lbs.

19. Connect the exhaust pipe at the catalytic converter.

20. Install the bolts attaching the torque converter to the flex plate. Torque the bolts to 40 ft. lbs.

21. Remove the floor jack.

22. Install the torque converter inspection cover.

23. If the vehicle is equipped with a diesel engine, install the left motor mount and starter.

24. Install the rear driveshaft. Use new strap bolts. Torque the strap bolt nuts to 14 ft. lbs.; the flange bolts to 35 ft. lbs.

25. Lower the truck.
26. Connect the negative battery cable.

SHIFT LINKAGE ADJUSTMENT

1. Raise and safely support the vehicle.
2. Loosen the shift rod trunnion jamnuts.
3. Remove the lockpin that retains the shift rod trunnion to the bell crank. Disengage the trunnion and shift rod at the bell crank.
4. Place the gear shift lever in the **P** position and lock the steering column.
5. Move the transmission lever rearward into the **P** detent. Be sure the lever is as far rearward as it will go.
6. Check the engagement of the park detent by trying to rotate the driveshaft with the rear wheels off of the ground. The shaft will not rotate if the park detent is engaged.
7. Adjust the trunnion until it will fit in the bell crank arm freely. Tighten the jamnuts. Install the lock pin.
8. Check engine starting in **P** and **N**, be sure it will not start in any other gear.

THROTTLE LINKAGE ADJUSTMENT

2.5L Engine with Carburetor

1. Disconnect the throttle control rod spring at the carburetor.
2. Raise and support the vehicle safely.
3. Use the throttle control rod spring to hold the transmission throttle control lever forward against its stop.
4. Hook one end of a spring on the throttle control lever and the other end of the spring on the throttle linkage bellcrank bracket, which is attached to the torque converter housing.
5. Lower the vehicle. Block the choke in the open position. Set the carburetor throttle off the fast idle cam.
6. Turn the ignition key to the **ON** position in order to energize the solenoid.
7. Open the throttle halfway to allow the solenoid to lock. Return the carburetor to the idle position.
8. Loosen the retaining bolt on the throttle control adjusting link. Do not remove the spring clip and nylon washer.
9. Pull the end of the link to eliminate lash. Tighten the retaining bolt. Turn the ignition to the **OFF** position.
10. Raise and support the vehicle safely. Remove the throttle control rod spring from the linkage. Lower the vehicle. Install the spring on the throttle control rod.

2.5L Engine with TBI

NOTE: An idle speed assembly exerciser box is required in order to make this adjustment. The purpose of this special tool is to bypass the idle speed motor.

1. Be sure that the vehicle ignition key is in the **OFF** position. Raise and support the vehicle safely.
2. Hook one end of a spring on the throttle control lever and the other end of the spring on the throttle linkage bellcrank bracket, which is attached to the torque converter housing. Lower the vehicle.
3. Disconnect the idle speed actuator motor wire harness and connect the idle speed assembly exerciser box. Upon connection, the adjustment light should turn off and the ready light should turn on.
4. Loosen the retaining bolt on the throttle control adjusting link. Pull the end of the link in order to eliminate lash and tighten the link retaining bolt.
5. Press the extend button on the idle speed assembly exerciser box until the idle speed actuator motor ratchets.
6. Disconnect the idle speed assembly exerciser box and reconnect the idle speed actuator motor wiring harness.
7. Raise and safely support the vehicle. Remove the spring from the linkage. Lower the vehicle.

2.8L Engine

1. Remove the air cleaner assembly. Raise and support the vehicle safely.
2. Hold the throttle control lever rearward against its stop. Use a spring to hold the lever. Hook one end of the spring to the lever and the other end to a convenient mounting point.
3. Lower the vehicle. Block the choke open and set the carburetor linkage off of the fast idle cam.
4. Unlock the throttle control cable by releasing the T shaped cable adjuster clamp. Release the clamp by lifting it upward using a suitable tool.
5. Grasp the cable outer sheath and move the cable and sheath forward, this will remove any cable load on the throttle cable bellcrank.
6. Adjust the cable by moving the cable and sheath rearward until there is 0 lash between the plastic cable end and the bellcrank ball.
7. When this has been accomplished, lock the cable by pressing the T shaped adjuster clamp downward.
8. Install the air cleaner assembly. Raise and support the vehicle safely. Remove the spring from its mounting. Lower the vehicle.

4.2L Engine

1. Disconnect the throttle control

return spring at the carburetor, if equipped. Raise and support the vehicle safely.

2. Use the throttle control rod spring to hold the throttle control lever forward against its stop, by hooking one end of the spring on the throttle control lever and the other end on the throttle linkage bell crank bracket which is attached to the transmission housing.

3. Block the choke plate open and move the throttle linkage off the fast idle cam.

4. On carburetors equipped with a throttle operated solenoid valve, turn the ignition **ON** to energize the solenoid, then open the throttle halfway to allow the solenoid to lock and return the carburetor to the idle position.

5. Loosen the retaining bolt on the throttle control adjusting link. Do not remove the spring clip and nylon washer.

6. Pull on the end of the link to eliminate play and tighten the retaining bolt.

7. Remove the throttle control rod spring and install it on the control rod.

5.9L Engine

1. Disconnect the throttle control rod spring at the carburetor. Raise and support the vehicle safely.

2. Use the throttle control rod spring to hold the transmission throttle valve control lever against its stop.

3. Block the choke plate open and make sure the throttle linkage is off the fast idle cam.

4. On carburetors equipped with a throttle operated solenoid valve, turn the ignition to **ON** to energize the solenoid. Then turn the throttle halfway to allow the solenoid to lock and return the carburetor to idle.

5. Loosen the retaining bolt on the throttle control rod adjuster link. Remove the spring clip and move the nylon washer to the rear of the link.

6. Push on the end of the link to eliminate play and tighten the link retaining bolt. Install the nylon washer and spring clip.

7. Remove the throttle control rod spring and install it in its intended position.

TRANSFER CASE

Transfer Case Assembly

REMOVAL & INSTALLATION

New Process 207

1. Shift the case into 4H.

2. Raise and safely support the vehicle.

3. Drain the transfer case.

4. Matchmark the rear driveshaft and remove it.

5. Disconnect the speedometer cable, vacuum hoses and vent hose from the case.

6. Support the transmission with a suitable transmission jack.

7. Remove the crossmember.

8. Matchmark the front driveshaft and remove it.

9. Disconnect the shift lever linkage rod at the case.

10. Remove the shift lever bracket bolts.

11. Support the transfer case with a suitable jack and remove the attaching bolts.

12. Pull the case out of the vehicle.

To install:

13. Raise the transfer case into position. Torque the attaching bolts to 26 ft. lbs.

14. Connect the shift lever linkage rod at the case.

15. Install the shift lever bracket bolts.

16. Install the front driveshaft. New strap bolts should be used. Torque the nuts to 14 ft. lbs. Torque the flange bolts to 35 ft. lbs.

17. Install the crossmember. Torque the bolts to 30 ft. lbs.

18. Remove the support jack.

19. Connect the speedometer cable, vacuum hoses and vent hose at the case.

20. Install the rear driveshaft. Use new strap bolts, torqued to 14 ft. lbs. Torque the flange bolts to 35 ft. lbs.

21. Fill the transfer case to the correct level.

22. Lower the vehicle.

New Process 228

1. Raise and safely support the vehicle.

2. Drain the transfer case.

3. Disconnect the speedometer cable, vacuum hoses and vent hose from the case.

4. Disconnect the shift lever linkage rod at the case.

5. Support the transmission with a suitable jack. Remove the rear crossmember.

6. Matchmark the rear driveshaft and remove it.

7. Matchmark the front driveshaft and remove it.

8. Remove the shift lever bracket bolts.

9. Support the transfer case with a suitable jack and remove the attaching bolts.

10. Pull the case rearward out of the vehicle.

To install:

11. Position the transfer case in the vehicle. Torque the attaching bolts to 40 ft. lbs.

12. Install the shift lever bracket bolts.

13. Install the front and rear driveshafts. New strap bolts should be used. Torque the strap bolt nuts to 14 ft. lbs.; the flange nuts to 35 ft. lbs.

14. Install the rear crossmember. Torque the bolts to 30 ft. lbs.

15. Connect the shift lever linkage rod at the case.

16. Connect the speedometer cable, vacuum hoses and vent hose from the case.

17. Fill the transfer case to the correct level.

18. Lower the vehicle.

New Process 229

1. Raise and safely support the vehicle.

2. Drain the transfer case.

3. Disconnect the speedometer cable and vent hose. Disconnect the shift lever link at the operating lever.

4. Support the transmission with a suitable jack.

5. Remove the rear crossmember.

6. Matchmark the driveshafts and remove them.

7. Disconnect the shift motor vacuum hoses.

8. Disconnect the shift linkage at the case.

9. Support the transfer case with a floor jack or transmission jack and remove the attaching bolts.

10. Pull the case rearward and remove it.

11. Clean the gasket mating surfaces and use new gasket material for installation.

To install:

12. Raise the transfer case into position. Make certain that the case and transmission are mated without binding, before torquing the attaching bolts. Torque the bolts to 26 ft. lbs.

13. Connect the shift linkage at the case.

14. Connect the shift motor vacuum hoses.

15. Install the driveshafts. New strap bolts should be used. Torque the nuts to 14 ft. lbs.; torque the flange nuts to 35 ft. lbs.

16. Install the rear crossmember. Torque the bolts to 30 ft. lbs.

17. Remove the transmission support jack.

18. Connect the speedometer cable and vent hose.

19. Connect the shift lever link at the operating lever.

20. Fill the transfer case.

21. Lower the vehicle.

New Process 231

1. Shift the transfer case into N.

2. Raise and support the vehicle safely.

3. Drain the lubricant.

4. Matchmark and remove the front and rear driveshafts.

5. Support the transmission with a suitable jack.

6. Remove the rear crossmember.

7. Disconnect the speedometer cable.

8. Disconnect the linkage.

9. Disconnect the vent and vacuum hoses and the indicator wire.

10. Support the transfer case with a transmission jack.

11. Remove the transfer case-to-transmission bolts.

12. Pull the case rearward to disengage it and lower it from the truck.

To install:

13. Raise the transfer case into position. Make certain that the case and transmission are mated without binding, before torquing the attaching bolts. Torque the bolts to 26 ft. lbs.

14. Connect the shift linkage at the case.

15. Connect the vacuum hoses.

16. Install the driveshafts. New strap bolts should be used. Torque the nuts to 14 ft. lbs.; torque the flange nuts to 35 ft. lbs.

17. Install the rear crossmember. Torque the bolts to 30 ft. lbs.

18. Remove the transmission floor jack.

19. Connect the speedometer cable and vent hose.

20. Connect the shift lever link at the operating lever.

21. Fill the transfer case to the correct level.

22. Lower the vehicle.

New Process 242

1. Shift the transfer case into N.

2. Raise and safely support the vehicle.

3. Drain the lubricant.

4. Matchmark and remove the front and rear driveshafts.

5. Support the transmission with a suitable jack.

6. Remove the rear crossmember.

7. Disconnect the speedometer cable.

8. Disconnect the linkage.

9. Disconnect the vent and vacuum hoses and the indicator wire.

10. Support the transfer case with a transmission jack.

11. Remove the transfer case-to-transmission bolts.

12. Pull the case rearward to disengage it and lower it from the truck.

To install:

13. Raise the transfer case into posi-

tion. Make certain that the case and transmission are mated without binding, before torquing the attaching bolts. Torque the bolts to 26 ft. lbs.

14. Connect the shift linkage at the case.

15. Connect the vacuum hoses.

16. Install the driveshafts. New strap bolts should be used. Torque the nuts to 14 ft. lbs.; torque the flange nuts to 35 ft. lbs.

17. Install the rear crossmember. Torque the bolts to 30 ft. lbs.

18. Remove the transmission floor jack.

19. Connect the speedometer cable and vent hose.

20. Connect the shift lever link at the operating lever.

21. Fill the transfer case.

22. Lower the vehicle.

LINKAGE ADJUSTMENT

1. Remove the shift lever boot.

2. Move the shift lever into the 4L position.

3. Insert a 4mm (0.157 in.) spacer between the shift lever and the forward edge of the shift lever gate. Secure the lever and spacer with tape.

4. Raise and safely support the vehicle.

5. Loosen the trunnion lock bolt. The linkage rod should slide freely on the trunnion.

6. Position the linkage rod so that it is a free fit in the range lever, then tighten the trunnion locknut.

7. Lower the vehicle.

8. Remove the spacer and install the shift boot and bezel. Verify the operation of the shifter.

Installing the shift lever adjusting spacer

Shift linkage adjusting trunnion

DRIVE AXLE

Driveshaft and U-Joints

REMOVAL & INSTALLATION

Front

NOTE: These vehicles may come equipped with one of 2 different type front driveshafts. The first type has a conventional universal joint at the axle, but a double offset joint at the transfer case. The second type has a conventional universal joint at the axle and a double cardan joint at the transfer case.

1. Place the transmission and transfer case in N.

2. Raise and safely support the vehicle.

3. Matchmark the shaft ends, axle and transfer case.

4. Remove the U-joint strap bolts at the front axle yoke.

5. Remove the double offset joint flange nuts at the transfer case.

6. Installation is the reverse of removal.

Rear

NOTE: Two different driveshafts are used on these vehicles. With Command-Trac®, the driveshaft has welded yokes at each end. With Selec-Trac®, a welded

yoke is used at the rear and a splined slip yoke is used at the front.

1. Place the transmission in N.

2. Raise and safely support the vehicle.

3. Matchmark the yokes and flanges.

4. On vehicles with Command-Trac®, the driveshaft may be removed by disconnecting it at the axle and sliding it from the front yoke, leaving the front yoke attached to the transfer case. If done this way, matchmark the driveshaft and front yoke before separation.

5. On vehicles with Selec-Trac®,

disconnect the yokes from the axle and transfer case. Remove the driveshaft.

6. Installation is the reverse of removal. Torque the U-joint strap nuts to 19 ft. lbs.

NOTE: New U-joint straps should be used.

Front Axle Shaft, Bearing and Seal

REMOVAL & INSTALLATION

Except CJ7

1. Raise and support the vehicle safely.
2. Remove the wheels, calipers and rotors.
3. Remove the cotter pin, locknut and axle hub nut.
4. Remove the hub-to-knuckle attaching bolts.
5. Remove the hub and splash shield from the steering knuckle.
6. To remove the left shaft, remove the axle shaft from the housing.
7. To remove the right shaft:
 - a. Disconnect the vacuum harness from the shift motor.
 - b. Remove the shift motor from the housing.
 - c. Remove the axle shaft from the housing.

To install:

8. To install the right axle shaft first be sure that the shift collar is in position on the intermediate shaft and that the axle shaft is fully engaged in the intermediate shaft end.
9. Install the shift motor, making sure that the fork engages with the collar. Tighten the bolts to 8 ft. lbs.
10. On the left side, install the axle shaft in the housing.
11. Partially fill the hub cavity of the knuckle with chassis lube and install the hub and splash shield.
12. Tighten the hub bolts to 75 ft. lbs.
13. Install the hub washer and nut. Torque the nut to 175 ft. lbs. Install the locknut. Install a new cotter pin.
14. Install the rotor, caliper and wheel.

CJ7

1. Raise and safely support the front of the vehicle. Remove the hub. Remove the brake caliper.
2. Remove the drive flange snapping.
3. Remove the rotor hub bolts, cover and gasket.
4. Release the locking lip of the lockwasher, and remove the outer nut, lockwasher, adjusting nut, and bearing lockwasher.
5. Remove the bearing and rotor.

6. Remove the backing plate adapter and splash shield.

7. Remove the spindle and spindle bushing.

8. Remove the axle shaft and universal joint assembly.

To install:

9. Clean all parts.
10. Insert the universal joint and axle shaft assembly into the axle housing, being careful not to knock out the inner seal. Insert the splined end of the axle shaft into the differential and push into place.
11. Install the wheel bearing spindle and bushing.
12. Install the backing plate adapter and splash shield.
13. Grease and assemble the wheel bearings and oil seal.
14. Install the rotor, hub, and caliper. Install the wheel bearing washer and adjusting nut. Tighten the nut to 50 ft. lbs., and back it off $\frac{1}{8}$ – $\frac{1}{4}$ turn while rotating the hub. Install the lockwasher and nut, tighten the nut to 50 ft. lbs. and then bend the lip of the lockwasher over onto the locknut.
15. Install the drive flange and gasket onto the hub and attach with 6 capscrews and lockwashers. Torque the capscrews to 30 ft. lbs. in an alternate and even pattern. Install the snapping onto the outer end of the axle shaft.
16. Install the hub cap or locking hub mechanism.
17. Install the wheel, lug nuts, and wheel disc.
18. Check the front wheel alignment, bleed the brakes and lubricate the front axle universal joints.

Rear Axle Shaft, Bearing and Seal

REMOVAL & INSTALLATION

CJ7

1. Remove the cotter pins from the axle shaft nuts. Remove the axle shaft nuts. Raise the vehicle and support it safely.
2. Remove the rear wheels. Remove the brake drum retaining screws. Remove the brake drums.
3. Remove the axle hub using tool J-25109-01 or equivalent. Disconnect the brake lines at the wheel cylinders. Remove the support plates, oil seals and retainers and the endplay shims. Axle shaft endplay shims are installed on the left side of the axle only.
4. Remove the axle shafts using tool J-2498 or equivalent.
5. Installation is the reverse of the removal procedure. On vehicles equipped with a Trac-Loc differential, do not rotate the differential gears un-

less both axles are in position. If one shaft is removed and the other shaft rotated, the side gear splines will become misaligned and prevent installation of the replacement shaft.

Wagoneer, Cherokee and Comanche

1. Raise and support the vehicle safely.
2. Remove the wheel, brake drum and brake support retaining nuts.
3. Pull the axle with a slide hammer.
4. Installation is the reverse of removal. Clean the bore in the axle housing and apply a thin coat of grease to the outer diameter of the bearing cup. Tighten the brake support nuts alternately and evenly to seat the bearing cup rib ring.

Wrangler, Grand Wagoneer, J10 Pick-Up and J20 Pick-Up

1. Raise and support the vehicle safely. Remove the wheels. Remove the brake drum.
2. Remove the nuts attaching the support plate and retainer to the axle tube flange using the access hole in the axle shaft flange.
3. Position adapter tool J-21579, or equivalent and a slide hammer on the axle shaft flange. Remove the axle shaft from the rear axle assembly.
4. If the cup portion of the wheel bearing assembly remains in the axle assembly, remove it using tool J-2619-01 or J-26941.
5. Installation is the reverse of the removal procedure.

Steering Knuckle

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the wheel assembly.
2. Remove the outer axle shaft.
3. Remove the caliper anchor plate from the knuckle.
4. Remove the knuckle-to-ball joint cotter pins and nuts.
5. Drive the knuckle out with a brass hammer.

NOTE: A split ring seat is located in the bottom of the knuckle. During installation, this ring seat must be set to a depth of 5.23mm. Measure the depth to the top of the ring seat.

6. Installation is the reverse of removal. Tighten the knuckle retaining nuts to 75 ft. lbs. and the caliper anchor bolts to 77 ft. lbs.

Steering knuckle assembly

Pinion Seal

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.
2. Mark and remove the driveshaft.
3. Using a holding tool and socket wrench, remove the pinion yoke nut and washer. Discard the nut.
4. Using a puller, remove the yoke.
5. Punch the seal with a pin punch and pry it from the seal bore.
6. Drive the new seal into place. A seal drive is helpful.
7. Install the yoke, washer and a new nut. Torque the nut to 210 ft. lbs.
8. Install the driveshaft. Torque the starp bolt nuts to 14 ft. lbs.

NOTE: New strap bolts should be used whenever the driveshaft is disconnected.

Differential Carrier

REMOVAL & INSTALLATION

1. Raise the vehicle and support it safely. Remove the wheels and drums. Remove the axle shafts.
2. Drain the axle housing lubricant. Remove the axle housing cover. Mark the differential bearing caps for align-

Checking ring gear endplay

ment during the assembly. Loosen the bearing cap bolts but do not remove.

3. Install an axle housing spreader tool on the axle housing and secure with the hold down clamps. Mount a dial indicator on the axle housing to measure the amount of spread. Zero the indicator dial.

4. Spread the axle housing no more than 0.020 in. Remove the differential bearing caps and the dial indicator from the housing. Using 2 pry bars, remove the differential carrier from the axle housing.

5. Remove the spreader tool from the housing as soon as the differential carrier is removed to avoid the possibility of the axle housing taking a set.

To install:

6. Position the axle housing spreader tool on the axle housing and secure it in place with the hold down clamps. Install a dial indicator and center the dial.

7. Spread the axle housing to a maximum of 0.020 in.. Remove the dial indicator. Lubricate the differential side bearings and install the differential carrier in the axle housing.

8. Prior shim fitting and bearing preload should be accomplished before differential carrier installation. Tap the unit in place with a soft faced hammer. Remove the axle housing spreader tool.

9. Install the bearing caps in their proper place and torque to 40 ft. lbs. on model 30 rear axle and to 80 ft. lbs. on models 44 and 60.

10. Install a dial indicator and recheck the ring gear backlash at 2 points. Correct as necessary. Complete the assembly in the reverse of the removal procedure.

Rear Axle Housing

REMOVAL & INSTALLATION

CJ7

1. Remove the cotter pins from the axle shaft nuts. Remove the axle shaft

Exploded view of the Dana 44 axle

nuts. Raise the vehicle and support it safely.

2. Remove the rear wheels. Remove the brake drum retaining screws. Remove the brake drums.

3. Remove the axle hub using tool J-25109-01 or equivalent. Disconnect the brake lines at the wheel cylinders. Remove the support plates, oil seals and retainers and the endplay shims. Axle shaft end play shims are installed on the left side of the axle only.

4. Remove the axle shafts using tool J-2498 or equivalent. Drain the lubricant and remove the axle housing cover. Disconnect the parking brake cables at the equalizer.

5. Mark the driveshaft for reinstallation. Disconnect the shaft at the axle yoke.

6. Disconnect the flexible brake hose at the body floorpan bracket. Disconnect the vent hose at the axle tube.

7. Properly support the rear axle assembly. Remove the spring U-bolts, spring plates and spring clip plate, if the vehicle is equipped with a stabilizer bar.

8. Remove the rear axle from the vehicle.

9. Installation is the reverse of the removal procedure.

Cherokee, Wagoneer and Comanche

1. Raise and support the vehicle safely. Remove the wheels and brake drums.

2. Disconnect the shock absorbers. Disconnect the brake hose at the

frame rail. Disconnect the parking brake cables at the equalizer.

3. Mark the relation between the driveshaft and yoke and disconnect the driveshaft.

4. Position a jack under the axle to take up the weight. Remove the axle to spring U-bolts and lower the axle.

5. Installation is the reverse of the removal procedure. Bleed the brakes.

Wrangler, Grand Wagoneer, J10 Pick-Up and J20 Pick-Up

1. Raise the vehicle and support it safely. Remove the rear wheels.

2. Place an indexing mark on the rear yoke and driveshaft, and disconnect the shaft. If equipped, disconnect the track bar at the axle bracket and the vent tube at the axle.

3. Disconnect the shock absorbers from the axle tubes. Disconnect the brake hose from the tee fitting on the axle housing. Disconnect the parking brake cable at the frame mounting.

4. Remove U-bolts. On vehicles with spring mounted above axle, disconnect spring at rear shackle.

5. Properly support the axle. Remove the spring clips and remove the axle assembly from under the vehicle.

6. Installation is the reverse of the removal procedure. Bleed and adjust brakes accordingly.

Front Axle Housing

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.

2. Remove the wheels, calipers and rotors.

3. Disconnect all vacuum hoses at the axle.

4. Mark the relation between the front driveshaft and yoke.

5. Disconnect the stabilizer bar, rod and center link, front driveshaft, shock absorbers, steering damper, track bar.

6. Support the front axle to take the weight off of it.

7. Disconnect the upper and lower control arms at the axle and lower the axle from the vehicle.

8. Installation is the reverse of removal. Observe the following torques: Upper control arm-to-axle—55 ft. lbs.

Lower control arm-to-axle—133 ft. lbs.

Track bar-to-axle—74 ft. lbs.

Steering damper-to-axle—55 ft. lbs.

Shock absorber lower bolt—14 ft. lbs.

Center link-to-knuckle—35 ft. lbs.

Stabilizer bar-to-axle—70 ft. lbs.

U-joint strap nuts—14 ft. lbs.

NOTE: Discard the U-joint straps. New replacement straps must be used whenever the straps are removed.

Axle Shift Motor and Housing

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

Axle shift motor and housing—location

2. Position a drain pan under the shift motor housing. Disconnect the vacuum harness from the shift motor.
3. Remove the housing attaching bolts and remove the housing, motor and shift fork as an assembly.
4. Add 5 ounces of SAE 75W-90 axle oil to the axle through the shift motor opening.
5. Install the motor housing into position and tighten the mounting bolts to 101 inch lbs. (11 Nm).
6. Connect the vacuum harness and lower the vehicle.
7. Check the operation of the shift mechanism.

STEERING

Steering Wheel

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Set the front tires in a straight ahead position.
3. Pull the horn button from the steering wheel. With sport wheel, remove the button, nut, washer, retainer and horn ring. It is necessary to remove the attaching screws from under the steering wheel spoke to remove the horn cover.
4. Remove the steering wheel nut and horn button contact cup.
5. Scribe a line mark on the steering wheel and steering shaft if there is not one already. Release the turn signal assembly from the steering post and install a puller.
6. Remove the steering wheel and spring.
7. To install, align the scribe marks on the steering shaft with the steering wheel and secure the steering wheel spring, steering wheel, and horn button contact cup with the steering wheel nut.
8. Install the horn button.

9. Connect the battery cable and test the horn.

Manual Steering Gear REMOVAL & INSTALLATION

1. Disconnect the steering shaft from the gear.
2. Raise and safely support the vehicle.
3. Disconnect the center link from the pitman arm.
4. Remove the front stabilizer bar.
5. Remove the pitman arm nut, matchmark the arm and shaft, and remove the arm with a puller.
6. Unbolt and remove the gear.
7. Installation is the reverse of removal. The pitman arm nut must be securely staked. Observe the following torques:

Steering gear-to-frame—65 ft. lbs.
Pitman arm-to-shaft—185 ft. lbs.
Stabilizer bar-to-frame—55 ft. lbs.
Stabilizer bar-to-link—27 ft. lbs.
Center link-to-pitman arm—55 ft. lbs.

ADJUSTMENT

1. Raise and safely support the vehicle.
2. Check the steering gear mounting bolt torque.
3. Matchmark the pitman arm and shaft, and remove the pitman arm nut. Remove the arm with a puller.
4. Loosen the pitman adjusting

screw locknut, then back off the adjusting screw 2-3 turns.

5. Remove the horn button and cover. Slowly turn the steering wheel in one direction as far as it will go, then back ½ turn.

6. Install a socket and torque wrench in the steering wheel nut. Measure the worm bearing preload by turning the wheel through a 90 degree arc (¼ turn) with the wrench. Preload should be 5-8 inch lbs.

7. If preload is not within specifications, turn the adjuster screw clockwise to increase, or counterclockwise to decrease, the preload.

8. When the desired preload is attained, tighten the adjuster locknut to 90 ft. lbs. and recheck the adjustment.

9. Rotate the steering wheel slowly from lock-to-lock, counting the number of turns. Turn the wheel back, ½ the number of turns to center the gear, then turn the wheel ½ turn off of center.

10. Install the torque wrench and socket on the steering wheel nut. Measure the torque required to turn the gear through the center point of travel. The drag should equal the worm bearing preload torque plus 4-10 inch lbs., but not exceed a total of 18 inch lbs.

11. If adjustment is required, loosen the pitman shaft screw locknut and turn the adjusting screw to obtain the desired torque. Tighten the locknut to 25 ft. lbs. and recheck the overcenter drag.

12. Install all parts and check steering wheel alignment.

Exploded view of the manual steering gear

Power Steering Gear

REMOVAL & INSTALLATION

1. Disconnect the steering shaft from the gear.
2. Raise and safely support the vehicle.
3. Disconnect the center link from the pitman arm.
4. Remove the front stabilizer bar.
5. Remove the pitman arm nut, matchmark the arm and shaft, and remove the arm with a puller.
6. Disconnect and plug the power steering lines.
7. Unbolt and remove the gear.
8. Installation is the reverse of removal. The pitman arm nut must be securely staked. Observe the following torques:
 - Steering gear-to-frame—65 ft. lbs.
 - Pitman arm-to-shaft—185 ft. lbs.
 - Stabilizer bar-to-frame—55 ft. lbs.
 - Stabilizer bar-to-link—27 ft. lbs.
 - Center link-to-pitman arm—55 ft. lbs.
9. Fill the power steering system to the correct level and bleed the system.

Wormshaft bearing preload adjustment

WORM BEARING PRELOAD ADJUSTMENT

1. Remove the steering gear and place in on a clean workbench.
2. Remove the adjuster plug lock-

nut. Seat the adjuster plug firmly by applying about 20 ft. lbs. of torque.

3. Place an index mark on the gear housing, opposite one of the adjuster plug holes.

4. Going counterclockwise, make another mark $\frac{3}{16}$ – $\frac{1}{4}$ in. from the first mark.

5. Turn the adjuster plug counterclockwise until the hole, which was aligned with the first mark, is now aligned with the second mark.

6. Install the adjuster plug locknut and torque it to 85 ft. lbs., making certain that the adjuster plug does not move.

7. Turn the stub shaft clockwise to its stop, then turn it back $\frac{1}{4}$ turn.

8. Using an inch pound (inch lbs.) torque wrench with a 50 inch lbs. scale and a 12 point deep socket on the stub shaft, take a reading of effort when the beam of the torque wrench passes the vertical point while turning. Torque at this point must be 4–10 inch lbs. If the reading is not correct, the adjuster plug is either not set correctly or moved while tightening the locknut, or, there is internal damage in the gear.

Pitman Shaft Overcenter Drag Torque

1. Turn the pitman shaft adjuster screw counterclockwise until it is fully extended, then, turn it back $\frac{1}{2}$ turn.

2. Rotate the stub shaft from stop to stop, counting the total number of full turns, then, turn it back $\frac{1}{2}$ the number of full turns. This is the center point of its travel. When the gear is centered, the flat on the stub shaft should face upward and be parallel with the side cover. The master spline on the pitman shaft should be aligned with the adjuster screw.

3. Place an inch pound torque wrench with a 50 inch lbs. scale, and a 12 point deep socket, on the stub shaft, with the torque wrench beam in the vertical position.

4. Rotate the torque wrench 45 degrees to each side of center and note the highest torque reading on or near the center point. Adjust the drag torque, by turning the adjusting screw clockwise, to the following values:

a. New steering gears (used less than 400 miles), add 4–8 inch lbs. to the previously noted torque, but don't exceed a total of 18 inch lbs.

b. Used gears (used 400 miles or more), add 4–5 inch lbs. to the previously noted torque, but don't exceed a total of 14 inch lbs.

5. When adjustment is complete, tighten the locknut to 20 ft. lbs.

6. Install the gear in the vehicle.

Power Steering Pump

REMOVAL & INSTALLATION

Engines with Serpentine Drive Belt

NOTE: A belt tension gauge is needed to adjust the belt tension.

1. Disconnect the negative battery cable. Loosen the alternator adjustment and pivot bolts.

2. Insert the drive lug of a $\frac{1}{2}$ in. drive ratchet into the adjustment hole in the alternator bracket and move the alternator to relieve tension on the belt.

3. Remove the drive belt.

4. Remove the air cleaner.

5. Disconnect the hoses at the pump and cap the hose ends.

6. Remove the front bracket-to-engine bolts.

7. Support the pump and remove the pump-to-rear bracket nuts.

8. Lift out the pump.

To install:

9. Install the pump in position and torque the pump-to-bracket nuts to 28 ft. lbs.; the bracket-to-engine bolts to 33 ft. lbs.

Power steering pump—exploded view

10. Install the drive belt. Using the $\frac{1}{2}$ in. drive ratchet, move the alternator to put tension on the belt, tighten the alternator adjustment and pivot bolts and check the belt tension with a tension gauge at the mid-point of its longest straight run.

11. Belt tension should be 180–200 ft. lbs. for a new belt, or 140–160 ft. lbs. for a used belt.

12. When the tension is achieved, tighten the alternator pivot bolt to 28 ft. lbs.; the adjustment bolt to 18 ft. lbs.

Engines with V-Type Drive Belt

1. Disconnect the negative battery cable. Loosen the power steering pump adjustment and pivot bolts.

2. Insert the drive lug of a $\frac{1}{2}$ in. drive ratchet into the adjustment hole in the pump rear bracket and move the pump to relieve tension on the belt.

3. Remove the drive belt.

4. Remove the air cleaner.

5. Disconnect the hoses at the pump and cap the hose ends.

6. Remove the front bracket-to-engine bolts.

7. Support the pump and remove the pump-to-rear bracket nuts.

8. Lift out the pump.

9. Install the pump into position and torque the pump-to-bracket nuts to 28 ft. lbs.; the bracket-to-engine bolts to 33 ft. lbs.

10. Install the drive belt. Using the $\frac{1}{2}$ in. drive ratchet, move the pump to put tension on the belt, tighten the pump adjustment and pivot bolts and check the belt tension with a tension gauge at the mid-point of its longest straight run. Belt tension should be 120–160 ft. lbs. for a new belt, or 90–115 ft. lbs. for a used belt.

11. When the tension is achieved, tighten the pump pivot nut to 21 ft. lbs.; the adjustment bolt to 21 ft. lbs.

System Bleeding

1. Raise the front of the vehicle and support safely.

2. With the wheels turned all the way to the left, add power steering fluid to the **COLD** mark on the fluid level indicator.

3. Start the engine and check the fluid level at fast idle. Add fluid, if necessary to bring the level up to the **COLD** mark.

4. Bleed air from the system by turning the wheels from side-to-side without hitting the stops. Keep the fluid level just above the internal pump casting or at the **COLD** mark.

5. Return the wheels to the center position and continue running the engine for 2–3 minutes.

6. Road test the vehicle to check steering function and recheck the fluid level with the system at its normal operating temperature. Fluid should be at the **HOT** mark.

Tie Rod Ends

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Remove the cotter pins and retaining nuts at both ends of the tie rod.

3. Remove the tie rod ends from the steering arm and center link.

4. Count the number of visible threads on the tie rod and unscrew the tie rod ends.

5. Installation is the reverse of removal. Install the tie rod ends, leaving the same number of threads exposed. Torque the retaining nuts to 35 ft. lbs.

BRAKES

For all brake system repair and service procedures not detailed below, please refer to "Brakes" in the Unit Repair section.

Anti-Lock Brake System Pressure Relief

The anti-lock brake system operates under extremely high pressure. The pressure in the system must be relieved before any system repairs can be made.

1. Turn the ignition switch **OFF**.

2. Apply the brakes 45–50 times, until the pedal is firm, to reduce pressure in the accumulator, booster pump and lines.

Master Cylinder

REMOVAL & INSTALLATION

Except Anti-Lock Brakes

1. Disconnect the negative battery

cable. Disconnect and plug the brake lines.

2. Disconnect the wires from the stoplight switch.

3. Remove all attaching bolts and nuts, and lift the assembly from the vehicle.

4. Prior to installation, fill the master cylinder and operate the pushrod until fluid squirts from the ports.

5. Installation is the reverse of removal. Torque the mounting nuts to 15-18 ft. lbs. Bleed the brake system.

Anti-Lock Brakes

NOTE: The master cylinder on the anti-lock brake system contains the system pressure accumulator and modulator.

1. Disconnect the negative battery cable.

2. Remove the windshield washer fluid bottle.

3. Remove the air cleaner.

4. Disconnect the electronic control unit harness at the pressure modulator.

5. Disconnect the wiring at the proportioning valve.

6. Disconnect the brake line under the proportioning valve at the coupling.

7. Disconnect and cap the pressure line at the accumulator block.

8. Place a drain pan under the supply line and disconnect the supply line at the reservoir. Cap the openings. Discard the drained fluid.

9. Disconnect the low pressure switch wiring.

10. Disconnect the wiring at the modulator boost pressure and fluid level switches.

11. Disconnect the front brake lines at the outboard side of the pressure modulator.

12. Remove the instrument panel lower trim cover.

13. Disconnect the wiring at the brake light switch.

14. Remove the master cylinder pushrod bolt and disconnect the pushrod from the brake pedal. Discard the pushrod bolt nuts.

15. Remove the master cylinder mounting stud nuts.

16. In the engine compartment, pull the assembly and mounting bracket forward until the studs are clear of the firewall.

17. Lift the assembly out of the engine compartment.

To install:

18. Position the assembly in the firewall.

19. Install the master cylinder mounting stud nuts. Torque the nuts to 27 ft. lbs.

20. Connect the pushrod at the brake

pedal. Torque the new nuts to 25 ft. lbs. for the inner locknut; 75 inch lbs. for the outer jam nut.

NOTE: The pushrod must be installed with the bolt head on the left side of the pedal.

21. Connect the wiring at the brake light switch.

22. Install the instrument panel lower trim cover.

23. Connect the front brake lines at the outboard side of the pressure modulator.

24. Connect the wiring at the modulator boost pressure and fluid level switches.

25. Connect the low pressure switch wiring.

26. Connect the supply line at the reservoir.

27. Connect the pressure line at the accumulator block.

28. Connect the brake line under the proportioning valve at the coupling.

29. Connect the wiring at the proportioning valve.

30. Connect the electronic control unit harness at the pressure modulator.

31. Install the air cleaner.

32. Install the windshield washer bottle.

33. Connect the battery ground cable.

Anti-lock brake system component layout

34. Clean the master cylinder cap area, remove the cap and, if necessary, fill the reservoir to the **MAX** line. Do not overfill.

35. Connect the battery and turn the ignition switch to **ON**. Listen for the sound of the pump running. An audible drop in pump rpm indicates that the system is pressurizing normally. If the pump rpm does not drop after 20 seconds, immediately turn the key **OFF** and check all line fittings for leaks.

NOTE: Letting the pump run for more than 20 seconds without system pressure will damage the pump.

36. Recheck the fluid level and bleed the brake system.

Power Brake Booster

REMOVAL & INSTALLATION

Standard Brake System

1. Disconnect the negative battery cable. Disconnect the power unit pushrod at the pedal.

2. Disconnect the vacuum line at the power unit check valve.

3. Unbolt the master cylinder from the power unit and move it out of the way without disconnecting the brake lines. Be careful to avoid kinking the lines.

4. Unbolt and remove the power unit from the firewall.

5. Installation is the reverse of removal. Torque the power unit-to-firewall nuts to 30–35 ft. lbs.; the master cylinder-to-booster nuts to 15–18 inch lbs. Torque the pushrod nut to 35 ft. lbs.

14. Check the position of the lines. Make sure they are not kinked or touching any other component.

15. Clean the master cylinder cap area, remove the cap and, if necessary, fill the reservoir to the **MAX** line. Do not overfill it.

16. Connect the battery and turn the ignition switch to **ON**. Listen for the sound of the pump running. An audible drop in pump rpm indicates that the system is pressurizing normally. If the pump rpm does not drop after 20 seconds, immediately turn the key **OFF** and check all line fittings for leaks.

NOTE: Letting the pump run for more than 20 seconds without system pressure will damage the pump.

17. Recheck the fluid level.

Proportioning Valve

REMOVAL & INSTALLATION

Standard Brake System

1. Disconnect the linkage and spring.

2. Disconnect and cap the brake lines.

3. Unbolt and remove the valve.

4. Installation is the reverse of removal. Torque the valve bracket-to-frame bolts to 155 inch lbs.; the valve-to-bracket bolts to 118 inch lbs.

ADJUSTMENT

1. Remove the valve shaft nut and washer.

2. Disconnect the valve lever and remove the spring.

3. Remove and discard the bushing.

4. Rotate the valve shaft and install adjusting gauge tool J-35853-2, or equivalent.

NOTE: The gauge must be properly seated on the D shape of the shaft and the valve lower mounting bolt. All linkage components, except the spring, must be connected before installing the new bushing.

5. Place the bushing in the lever, and, using bushing aligning tool J-35853-1 or equivalent, press the bushing and lever onto the shaft.

6. Remove the lever and adjusting tool J-35853-2 or equivalent, and install the spring.

7. Install the lever, washer and nut. Tighten the nut to 100 inch lbs.

8. Connect the spring.

Booster Pump and Motor

REMOVAL & INSTALLATION

Anti-Lock Brake System

1. Relieve the brake system pressure. Check the fluid level in the reservoir. It should have risen above the **MAX** fill line, but not overflowed. If overflowing occurred, the system was over-filled to begin with.

2. Disconnect the negative battery cable.

3. Remove the coolant overflow bottle.

4. Remove the pump/motor mounting bracket bolts at the firewall and fender.

5. Rotate the pump/motor assembly to one side for access to the hoses and wires.

6. Unplug the wiring harness connector.

7. Slowly loosen the pressure line at the pump and allow any residual pressure to bleed off, then, disconnect the line.

8. Position a catch pan under the pump return line, loosen the clamp and disconnect the line. Discard any drained fluid.

9. Remove the pump/motor and bracket as an assembly. After removal, the units can be unbolted from the bracket.

To install:

10. Position the unit in the engine compartment.

11. Connect the pressure and return lines.

12. Connect the wiring harness.

13. Install the mounting bolts and torque to 30 ft. lbs.

Brake Caliper

REMOVAL & INSTALLATION

1. Drain $\frac{3}{4}$ of the brake fluid from the front reservoir. Use the bleeder screw at the front outlet port to drain the fluid. If equipped with anti-lock brakes, relieve the system pressure.

2. Raise and safely support the vehicle.

3. Remove the wheels.

4. Place a C-clamp on the caliper so that the solid end contacts the back of the caliper and the screw end contacts the metal part of the outboard brake pad.

5. Tighten the clamp until the caliper moves far enough to force the piston to the bottom of the piston bore. This will back the brake pads off of the rotor surface to facilitate the **REMOVAL & INSTALLATION** of the caliper assembly.

6. Remove the C-clamp.

NOTE: Do not push down on the brake pedal or the piston and brake pads will return to their original positions up against the rotor.

7. Remove both of the allen head mounting bolts and lift the caliper off the rotor.

NOTE: If just the brake pads are being replaced, it is not necessary to remove the caliper assembly entirely from the vehicle. Do not remove the brake line. Rest the caliper on the front spring or other suitable support. Do not allow the brake hose to support the weight of the caliper.

8. If the caliper is being removed, it is necessary to disconnect the brake

fluid hose. Clean the brake fluid hose-to-caliper connection thoroughly. Remove the hose-to-caliper bolt. Cap or tape the open ends to keep dirt out. Discard the copper gaskets.

9. Install the caliper in the reverse order of removal. Torque the mounting bolts to 35 ft. lbs.

NOTE: If the brake fluid hose was disconnected, it will be necessary to bleed the hydraulic system.

Disc Brake Pads

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Drain $\frac{3}{4}$ of the brake fluid from the front reservoir. Use the bleeder screw at the front outlet port to drain the fluid. If equipped with anti-lock brakes, relieve the system pressure.

3. Raise and support the vehicle safely.

4. Remove the wheels.

5. Place a C-clamp on the caliper so that the solid end contacts the back of the caliper and the screw end contacts the metal part of the outboard brake pad.

6. Tighten the clamp until the caliper moves far enough to force the piston to the bottom of the piston bore. This will back the brake pads off of the rotor surface to facilitate the removal & installation of the caliper assembly.

7. Remove the C-clamp.

NOTE: Do not push down on the brake pedal or the piston and brake pads will return to their original positions up against the rotor.

8. Remove both of the allen head mounting bolts and lift the caliper off the rotor.

9. Hold the anti-rattle clip against the caliper anchor plate and remove the outboard brake pad.

10. Remove the inboard pad and its anti-rattle clip.

11. Clean all the mounting holes and bushing grooves in the caliper ears. Clean the mounting bolts. Replace the bolts if they are corroded or if the threads are damaged. Wipe the inside of the caliper clean, including the exterior of the dust boot. Inspect the dust boot for cuts or cracks and for proper seating in the piston bore. If evidence of fluid leakage is noted, the caliper should be rebuilt.

NOTE: Do not use abrasives on the bolts in order not to destroy their protective plating. Do not use compressed air to clean the

inside of the caliper, as it may unseat the dust boot seal.

12. Install the inboard anti-rattle clip on the trailing end of the anchor plate. The split end of the clip must face away from the rotor.

13. Install the inboard pad in the caliper. The pad must lay flat against the piston.

14. Install the outboard pad in the caliper while holding the anti-rattle clip.

15. With the pads installed, position the caliper over the rotor. Line up the mounting holes in the caliper and the support bracket and insert the mounting bolts. Make sure that the bolts pass under the retaining ears on the inboard shoes. Push the bolts through until they engage the holes of the outboard pad and caliper ears. Thread the bolts into the support bracket and tighten them to 30 ft. lbs.

16. Fill the master cylinder with brake fluid and pump the brake pedal to seat the pads.

17. Install the wheel assembly and lower the vehicle. Check the level of the brake fluid in the master cylinder and fill as necessary. Test the operation of the brakes before taking the vehicle onto the road.

Brake Rotor

REMOVAL & INSTALLATION

Except Grand Wagoneer, J10 Pick-Up and J20 Pick-Up

1. Loosen the lug nuts on the front wheels.

2. Raise and safely support the vehicle.

3. Remove the front wheels.

4. Remove the calipers, but don't disconnect the brake lines. Suspend the calipers out of the way.

5. Remove the rotor.

6. Installation is the reverse of removal.

Grand Wagoneer, J10 Pick-Up and J20 Pick-Up

1. Raise and safely support the vehicle.

2. Remove the wheels.

3. Remove the caliper without disconnecting the brake line. Suspend it out of the way.

4. Remove the grease cap, cotter pin, nut cap, nut, and washer from the spindle.

5. Pull slowly on the hub and catch the outer bearing as it falls.

6. Remove the hub and rotor. The inner bearing and seal can be removed by prying out and discarding the inner seal.

To install:

7. Clean and repack the hub and bearings, install the inner bearing and a new seal.

8. Position the hub and rotor on the spindle and install the outer bearing.

9. Install the washer and nut.

10. While turning the rotor, torque the nut to 25 ft. lbs. to seat the bearings.

11. Back off the nut $\frac{1}{2}$ turn and, while turning the rotor, torque the nut to 19 inch lbs.

12. Install the nut cap and a new cotter pin. Install the grease cap.

13. Install the caliper.

14. Install the wheels.

Brake Drums

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Remove the wheel.

3. Remove the spring nuts from the lug bolts and remove the drum from the vehicle.

NOTE: It may be necessary to back off the brake adjusters to remove the drum.

4. When placing the drum on the hub, make sure that the contacting surfaces are clean and flat.

5. Install the spring nuts on the lug bolts and install the wheel.

Brake Shoes

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Turn the adjustment starwheel so that the brake shoes are retracted from the brake drum.

3. Remove the wheels and the drums to give access to the brake shoes.

4. Install wheel cylinder clamps to retain the wheel cylinder pistons in place and prevent leakage of brake fluid while replacing the shoes.

5. Remove the return springs with a brake spring remover tool.

6. Remove the adjuster cable, cable guide, adjuster lever and adjuster springs.

7. Remove the holddown washers and springs and remove the brake shoes.

8. Clean the backing plate with a brush or cloth. Place a dab of Lubriplate® on each spot where the brake shoes rub on the backing plate.

NOTE: Always replace brake linings in axle sets. Never replace

Rotor and bearing assemblies

Rotor and bearing assembly—Grand Wagoneer, J10 Pick-Up and J20 Pick-Up

Drum brake assembly—exploded view

linings on one side or on a single wheel.

9. Thoroughly clean the backing plate.

To install:

10. Apply a thin coat of multi-purpose chassis lube to the mounting pads on the backing plate.

11. Transfer the parking brake actuating lever to the new secondary shoe.

12. Position the brake shoes on the backing plate and install the holddown springs. Engage the parking brake lever with the cable.

13. Install the parking brake actuating bar and spring between the parking brake lever and primary shoe.

14. Install the self-adjusting cable, cable guide and upper return springs.

15. Thoroughly clean the starwheel and lightly lubricate the threads with lithium based grease.

16. Install the starwheel.

17. Install the self-adjusting cam and lower spring.

18. Check the surface of the brake shoes for any grease.

19. Install the drum and reach through the adjusting opening in the backing plate with a brake adjusting tool. Turn the starwheel outward so that the brakes lock the drum, then, holding the adjusting cam with a thin prybar, turn the starwheel back so that the drum is free and no drag is felt.

20. Once the wheels are on and the

vehicle is lowered, back it up several times, applying the brakes to actuate the self-adjusters.

Wheel Cylinders

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. If equipped with anti-lock brakes, relieve the system pressure.

2. Remove the wheel and remove the brake drum.

3. Disconnect the brake line at the wheel cylinder.

4. Remove the brake shoes.

5. Remove the wheel cylinder attaching bolts and remove the wheel cylinder.

To install:

6. Position the wheel cylinder on the backing plate.

7. Connect the brake line to the cylinder fitting.

8. Install the wheel cylinder mounting bolts. On CJ7, Wrangler, Comanche, Cherokee and Wagoneer, tighten the bolts to 90 inch lbs. (10 Nm); Grand Wagoneer, J10 Pick-Up and J20 Pick-Up to 18 ft. lbs. (24 Nm).

9. Tighten the brake line fitting to 140 inch lbs. (16 Nm).

10. Install the brake shoes. Adjust the brake shoes.

11. Install the brake drum and wheel. Lower the vehicle.

12. Fill the brake system to the correct level and bleed the brakes.

Parking Brake Cable

REMOVAL & INSTALLATION

1. Fully release the parking brake.

2. Raise and safely support the vehicle.

3. Remove the adjusting nut from the operating rod at the equalizer.

4. Disconnect the cable ends at the equalizer.

5. Unclip the cable from the frame bracket and unhook the locating spring from the cable.

6. Remove the rear wheels.

7. Remove the brake drums.

8. Remove the brake shoes.

9. Unhook the cable from the brake shoe actuating lever, compress the lock tabs at the backing plate and pull the cable out.

10. Installation is the reverse of removal.

Adjustment

1. Place the parking brake lever in the 5th notch.

2. Raise and safely support the vehicle.

3. Using a torque wrench and adjustment adapter J-34651 or equivalent, apply a torque of 45-50 inch lbs.

4. Adjust the equalizer adjusting nut so that the gauge pointer is in the green band on the tool.

5. Apply and release the brake lever

Typical parking brake cable layout

fully, 5 times, and recheck the adjustment.

6. When adjustment is correct, stake the adjusting nut.

FRONT SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

NOTE: Before installing new shocks, they should be purged of air. To do this, hold the shock up-right and fully extend it, then invert and compress it. Do this several times.

1. Raise and safely support the front of the vehicle.
2. Remove the locknuts and washers.
3. Pull the shock absorber eyes and rubber bushings from the mounting pins.
4. Install the shocks in the reverse order of the removal procedure. Torque the upper end nut to 8 ft. lbs. and the lower end bolts to 14 ft. lbs.

Coil Springs

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle, allowing the front axle to hang.

2. Support the axle with a suitable jack.
3. Remove the wheels.
4. On 4WD vehicles, matchmark and disconnect the front driveshaft from the axle.
5. Disconnect the lower control arm at the axle.
6. Disconnect the stabilizer bar links and the shock absorbers at the axle.
7. Disconnect the track bar at the sill bracket.
8. Disconnect the tie rod at the pitman arm.
9. Lower the axle until tension is removed from the spring, then loosen the spring retainer and remove the spring.
10. Installation is the reverse of removal. Observe the following torques:
 - control arm-to-axle—133 ft. lbs.
 - shock absorber-to-axle—14 ft. lbs.
 - stabilizer bar-to-axle—70 ft. lbs.
 - U-joint-to-axle—14 ft. lbs.
 - center link-to-pitman arm—35 ft. lbs.
 - track bar-to-frame rail—35 ft. lbs.

Leaf Springs

REMOVAL & INSTALLATION

1. Raise the vehicle and support it safely.
2. Position a suitable jack under the axle. Raise the axle to relieve the springs of the axle weight.
3. If equipped, disconnect the stabi-

lizer bar. Remove the spring U-bolts and tie plates.

4. Remove the bolt attaching the spring front eye to the shackle. Remove the bolt attaching the spring rear eye to the shackle.

5. Remove the spring from its mounting.

6. Installation is the reverse of the removal procedure.

Front Stabilizer Bar

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. Remove the stabilizer bar-to-frame clamps and cushions.
3. Disconnect the stabilizer bar at the connecting links and remove the stabilizer bar. If necessary, disconnect the connecting links from the axle bracket.
4. Installation is the reverse of removal. Torque the clamp-to-frame bolts to 55 ft. lbs., the stabilizer bar-to-connecting link nuts to 27 ft. lbs., and the connecting link-to-axle bolts to 70 ft. lbs.

Track Bar

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. Remove the cotter pin and nut securing the track bar to the frame bracket.
3. Remove the bolt and nut securing the track bar to the axle.
4. Installation is the reverse of removal. Install both ends loosely, then torque the fasteners. Torque the frame-end nut to 35 ft. lbs.; the axle-end bolt to 55 ft. lbs.

Upper Ball Joint

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the steering knuckle.
2. Position a ball joint removal tool J-34503-1 and 34503-3, or their equivalents, in a C-clamp and on the upper ball joint.
3. Tighten the clamp screw to remove the joint.
4. Use tools J-34503-5 and J-34503-12, or their equivalents, in a similar manner, to install the ball joint.
5. Install the knuckle.

Lower Ball Joint

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the steering knuckle.
2. Position a ball joint removal tool, J-34503-1 and J-34503-3 or their equivalents, on the lower ball joint.
3. Tighten the clamp screw to remove the joint.
4. Use tool J-34503-4 and J-34503-12 or their equivalents, to install the ball joint by reversing the removal procedure.
5. Install the knuckle.

Upper Control Arm

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle, allowing the suspension to hang freely.
2. On vehicles with the 2.8L engine, disconnect the right engine mount and raise the engine so that the rear bolt will clear the exhaust pipe.
3. Remove the wheels.
4. Remove the control arm-to-axle bolt.
5. Remove the control arm-to-frame bolt and remove the arm.
6. Installation is the reverse of removal. Torque the control arm bolts to 55 ft. lbs. at the axle; 66 ft. lbs. at the frame.

Lower Control Arm

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle, allowing the suspension to hang freely.
2. Disconnect the lower control arm at the axle and rear bracket. Remove the arm.
3. Installation is the reverse of removal. Torque the bolts to 133 ft. lbs.

Front Wheel Bearings

REMOVAL & INSTALLATION

2WD Vehicles

1. Loosen the lug nuts on the front wheels.
2. Raise and safely support the vehicle.
3. Remove the front wheels.
4. Remove the calipers, but don't disconnect the brake lines. Suspend the calipers out of the way.
5. Remove the dust cap, cotter pin, nut retainer, nut and thrust washer from the spindle.

6. Remove the rotor. Be ready to catch the outer bearing.

7. Carefully drive out the inner bearing and seal from the hub, using a wood block.

8. Inspect the bearing races for excessive wear, pitting or grooves. If they are cracked or grooved, or if pitting and excess wear is present, drive them out with a drift or punch.

To install:

9. Check the bearing for excess wear, pitting or cracks, or excess looseness.

NOTE: If it is necessary to replace either the bearing or the race, replace both. Never replace just a bearing or a race. These parts wear in a mating pattern. If just one is replaced, premature failure of the new part will result.

10. If the old parts are retained, thoroughly clean them in solvent and allow them to dry on a clean towel. Never spin dry them with compressed air.

11. Thoroughly clean the spindle.

12. Thoroughly clean the inside of the hub.

13. Pack the inside of the hub with EP wheel bearing grease. Add grease to the hub until it is flush with the inside diameter of the bearing cup.

14. Pack the bearing with the same grease.

15. If a new race is being installed, very carefully drive it into position until it bottoms all around, using a brass drift. Be careful to avoid scratching the surface.

16. Place the inner bearing in the race and install a new grease seal.

17. Position the hub and rotor on the spindle and install the outer bearing.

18. Install the washer and nut.

19. Install the nut cap and a new cotter pin. Install the grease cap.

20. Install the caliper.

21. Install the wheels.

ADJUSTMENT

CJ7

1. Raise and support the vehicle safely.

2. Remove the bolts attaching the front hub to the hub rotor. Remove the hub body and gasket.

3. Remove the snapping from the axle shaft and remove the hub clutch assembly.

4. Straighten the lip of the outer lock nut tabbed washer. Remove the outer locknut and tabbed washer.

5. Loosen and then tighten the inner locknut to 50 ft. lbs. Rotate the wheel while tightening the nut to seat the bearing properly.

6. Back off the inner locknut about

$\frac{1}{8}$ of a turn while rotating the wheel. The wheel must rotate freely.

7. Install the tabbed washer and the outer locknut.

8. Torque the outer locknut to 50 ft. lbs.

9. Recheck the bearing adjustment. The wheel must rotate freely. Correct as required.

Wrangler, Cherokee, Comanche and Wagoneer

1. Raise and support the vehicle safely. Remove the tire and wheel. Remove the disc brake caliper as required. Remove the cotter pin, locknut and axle hub nut.

2. Tighten the hub bolts to 75 ft. lbs.

3. Install the hub washer and nut and tighten the hub nut to 175 ft. lbs. Install the locknut and new cotter pins.

4. Install the caliper, if removed. Install the wheel. Lower the vehicle.

Grand Wagoneer, J10 Pick-Up and J20 Pick-Up

1. Raise and support the vehicle safely.

2. If the vehicle is not equipped with front hubs, remove the wheel cover and hubcap. Remove the drive gear snapping. Remove the drive gear, pressure spring and spring cup.

3. If the vehicle is equipped with front hubs, Remove the socket head screws from the hub body and remove the body from the hub clutch assembly. Remove the large retaining ring from the hub. Remove the small retaining ring from the axle shaft. Remove the hub and clutch assembly. Remove the outer locknut and lock washer.

4. Seat the bearings by loosening and then tightening them to 50 ft. lbs. Back off the inner locknut about $\frac{1}{8}$ of a turn while rotating the wheel.

5. Install the lock washer. Align one of the lock washer holes with the peg on the inner locknut and install the washer on the nut.

6. Install and torque the outer locknut to 50 ft. lbs. Recheck the bearing adjustment. Correct as required.

7. On vehicles without front hubs, The spring cup must be installed so the recessed side faces the bearing and the flat side faces the pressure spring. The pressure spring should contact the flat side of the cup only.

8. Install the spring cup and the pressure spring. Install the drive gear and the drive gear snapping.

9. If the vehicle is equipped with front hubs, Install the clutch assembly. Install the small retaining ring on the axle shaft. Install the large retaining ring on the hub.

10. Install the hub body on the hub clutch. Install the socket head screws in the hub and torque them to 30 inch lbs.

REAR SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

NOTE: Before installing new shocks, they should be purged of air. To do this, hold the shock upright and fully extend it, then invert and compress it. Do this several times.

1. Raise and safely support the vehicle, support the rear axle with a suitable jack.

2. Remove the locknuts and washers.

3. Pull the shock absorber eyes and rubber bushings from the mounting pins.

4. Install the shocks in the reverse order of the removal procedure. Torque the upper end nut to 44 ft. lbs. and the lower end bolts to 44 ft. lbs.

Leaf Springs

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle, allowing the suspension to hang freely.

2. Take up the weight of the axle with a suitable jack.

3. Disconnect the shock absorbers at the axle.

4. Remove the wheels.

5. Disconnect the stabilizer bar links at the spring plate.

6. Remove the U-bolts and spring plates.

7. Remove the rear spring-to-shackle bolt, then the front spring-to-shackle bolt.

8. Lower the axle and remove the spring.

9. Installation is the reverse of removal. Observe the following torques:

a. Front and rear shackle bolts—111 ft. lbs.

b. U-bolt nuts—52 ft. lbs.

c. Shock absorber-to-axle nuts—44 ft. lbs.

Rear spring mounting components

Rear stabilizer bar mounting

Rear Track Bar

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Remove the track bar attaching bolts at the frame and axle housing.

3. Remove the track bar.

4. Install the track bar into the brackets at the axle housing and the frame.

5. Tighten the attaching bolts to 105 ft. lbs. (168 Nm).

6. Lower the vehicle.

Rear Stabilizer Bar

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Remove the stabilizer bar-to-frame clamps and cushions.

3. Disconnect the stabilizer bar connecting links at the spring tie plates and remove the stabilizer bar.

4. Installation is the reverse of removal. Torque the clamp bolts and the connecting link nuts to 55 ft. lbs.

ENGINE ELECTRICAL

NOTE: Disconnecting the negative battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is reconnected.

Distributor

REMOVAL & INSTALLATION

Undisturbed Engine

1. Disconnect the negative battery cable.
2. Disconnect and label the spark plug wires at the distributor cap.
3. Remove the distributor cap from the distributor. Disconnect and label the distributor wiring.
4. Using a piece of chalk, matchmark the rotor to the distributor housing and the housing to the engine.
5. Remove the distributor hold-down nut, the clamp and lift the distributor from the engine.

NOTE: When removing the distributor, it may be necessary to rotate the distributor shaft slightly to disengage it from the drive gear.

To install:

6. Lower the distributor into the engine and align the rotor and distributor housing to the matchmarks.
7. Check and/or adjust the ignition timing when finished.

Disturbed Engine

1. If the engine was disturbed while the distributor was removed, remove the No. 1 spark plug.
2. Rotate the crankshaft in the normal direction of rotation until compression is felt at the spark plug hole.

View of the Ignition timing marks

3. Continue rotating the engine in the same direction while observing the timing marks at the indicator line up when No. 1 cylinder is at TDC.

4. Install the distributor and align the rotor with the No. 1 lug on the distributor cap.

5. Check and/or adjust the ignition timing when finished.

Ignition Timing

ADJUSTMENT

Except 2.8L Engine

NOTE: On the 2.0L and 2.3L engines, be sure to set the air gap in the distributor before timing the engine.

The timing marks are located near the front crankshaft pulley and consist of a pointer with graduations attached to the engine block and a mark on the crankshaft pulley.

1. Check and correct the air gap in the distributor.
2. Locate and clean the timing marks on the crankshaft pulley and the front of the engine.
3. Using an inductive pick-up timing light, connect it to the No. 1 spark plug wire. Attach a timing light to the ignition coil.
4. If the distributor is equipped with a vacuum advance, disconnect and plug the vacuum line.
5. Make sure all wires from the timing light and tachometer are clear of the fan and belts. Start the engine.
6. Adjust the idle to the correct rpm.
7. Aim the timing light at the timing marks. Adjust the distributor until the timing marks are aligned.
8. Tighten the distributor mounting bolt and check the timing again.
9. Turn the engine **OFF** and remove the timing light and tachometer. Connect the distributor vacuum line.

2.8L Engine

1. Set the parking brake and block the drive wheels.
2. Operate the engine to normal operating temperatures and turn the air conditioning **OFF**, if equipped.
3. Verify that the Check Engine light is not turned **ON**.
4. Place the Electronic Spark Timing (EST) into the bypass mode by disconnect the timing connector.

NOTE: The EST is a single wire connector, located under the cen-

ter console in the passenger compartment. Do not disconnect the 4-wire connector from the distributor.

5. Using an inductive pick-up timing light, connect it to the No. 1 spark plug wire.

6. Check and/or adjust the engine speed to 800 rpm.

7. Loosen the distributor hold-down bolt and turn the distributor until the timing mark, on the crankshaft pulley, is aligned with the 10 degree BTDC timing mark on the timing cover.

8. Tighten the distributor hold-down bolt.

9. Reconnect the timing connector and clear the ECM trouble code(s).

Air Gap Setting

On the 2.0L and 2.3L engines, the air gap setting in the distributor should be checked and adjusted before the ignition timing is adjusted.

ADJUSTMENT

1. Remove the distributor cap, O-ring and rotor.
2. Use a feeler gauge to measure the air gap at the pick up coil projection. The gap should be 0.008–0.016 in. (2.0L engine) or 0.012–0.020 in. (2.3L engine); adjust it, if necessary.
3. Loosen the screws and move the signal generator until the gap is correct. Tighten the screws and recheck the gap.

NOTE: The electrical parts in this system are not repairable. If found to be defective, they must be replaced.

Adjusting the air gap—2.0L and 2.3L engines

Alternator

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

BELT TENSION ADJUSTMENT

Except 2.8L Engine

1. Loosen the alternator pivot bolt.
2. Rotate the alternator to produce a belt deflection of 0.40 in. (10mm).
3. Tighten the alternator pivot bolt.

2.8L Engine

The 2.8L engine uses a single serpentine belt to drive all engine accessories. The belt tension is maintained by a spring loaded tensioner. The belt tensioner has the ability to control the belt tension over a broad range of belt lengths. However, there are limits to which the tensioner can compensate for varying lengths.

REMOVAL & INSTALLATION

Except 2.8L Engine

1. Disconnect the negative battery cable. If equipped with an air pump, it may be necessary to remove it.
2. Disconnect and label the alternator wiring.
3. Remove the alternator pivot bolt on the lower part of the alternator. Remove the drive belt from the pulley.
4. Remove the alternator mounting bolt(s) and the alternator from the engine.

To install:

5. Install the alternator.
6. Adjust the belt tension and tighten the alternator mounting bolts.
7. Reconnect the alternator's wiring connectors. Connect the negative battery cable.

2.8L Engine

1. Disconnect the negative battery cable.
2. Remove the terminal plug and the battery lead from the rear of the alternator.
3. Remove the drive belt.
4. Remove the air pump bracket bolt from the rear of the alternator.
5. Remove the mounting bolts from the front of the alternator and the alternator from the vehicle.

To install:

6. Install the alternator and the mounting bolts.
7. Install the drive belt.
8. Torque the lower mounting bolt to 26 ft. lbs. (35 Nm), the upper mounting bolt to 18 ft. lbs. (25 Nm) and the air pump bracket bolt to 18 ft. lbs. (25 Nm).
9. Connect the terminal connector and the battery lead to the rear of the alternator. Reconnect the negative battery cable.

Voltage Regulator

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

An external voltage regulator is used only with the 2.0L engine.

ADJUSTMENT

1. Remove the regulator from the vehicle and remove the regulator cover.
2. If the points are pitted, clean them carefully with fine emery paper.
3. Check and adjust the core gap first and then the point gap.
4. Adjust the core gap by loosening the screws attaching the contact set to the yoke. Move the contact set up or down as required. The standard core gap is 0.024–0.039 in. Tighten the at-

Adjusting the voltage regulator

taching screw.

5. Adjust the point gap by loosening the screw attaching the upper contact. Move the upper contact up or down as required. The standard point gap is 0.012–0.016 in.

6. Adjust the regulated voltage by turning the adjusting screw. Turn the adjusting screw in to increase voltage and out to reduce voltage. When the correct adjustment is obtained, secure the adjusting screw by tightening the locknut. The regulated voltage is 13.8–14.8V.

7. Install the regulator cover, reconnect the electrical leads and install the regulator.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Disconnect and label the electrical leads at the regulator.
3. Remove the 2 regulator mounting screws and remove the regulator.

To install:

4. Install the voltage regulator.
5. Connect the electrical leads to the regulator.
6. Connect the negative battery cable.

Starter

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

REMOVAL & INSTALLATION

Except 2.8L Engine

1. Disconnect the negative battery cable.
2. If equipped, it may be necessary to disconnect and remove the EGR pipe.
3. Disconnect and label the starter wiring at the starter.
4. Remove the starter-to-engine bolts and the starter from the vehicle.

To install:

4. Installation the starter to the engine.
5. Connect the electrical connectors to the starter.
6. If the EGR pipe was removed, install it.
7. Connect the negative battery cable.

2.8L Engine

1. Disconnect the negative battery cable.
2. Raise and safely support the vehicle.
3. Label and disconnect the electrical connectors from the starter.
4. Remove the starter-to-engine mounting bolts.
5. Lower the starter from the engine. If any shims are present, keep them for reinstallation purposes.

To install:

6. Install the starter and shims, if equipped, to the engine. Torque the bolts to 30 ft. lbs. (40 Nm).
7. Reconnect the electrical connectors to the starter.
8. Lower the vehicle.
9. Connect the negative battery cable.

Diesel Glow Plugs

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the electrical connector from the sensing resistor.
3. Remove the sensing resistor from the glow plug connector.

4. Disconnect the electrical connector from the glow plug terminals.

5. Remove the glow plugs from the engine.

NOTE: Even if 1 glow plug is found to be defective, replace the others.

6. Install the glow plugs to the engine.

7. Connect the electrical connector to the glow plug terminals.

8. Connect the sensing resistor to the glow plug electrical connector.

9. Connect the electrical connector to the sensing resistor. Connect the negative battery cable.

TESTING

1. Remove the glow plugs from the engine.

2. Using an ohmmeter, set it on the 5V DC scale.

3. Touch 1 lead to the glow plug's electrical terminal and the other lead to the glow plug's tip; the resistance should be 1.0 ohm at room temperature.

NOTE: If no continuity exists, the heat wire is broken and must be replaced.

4. Replace the glow plugs.

CHASSIS ELECTRICAL

Heater Blower Motor

The heater blower motor is located under the right side of the dash.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Disconnect and label the blower motor electrical leads.

3. Remove the blower-to-heater unit screws and lower the blower motor assembly.

To install:

4. Install the heater blower motor, into the heater unit and install the screws.

5. Connect the electrical connectors to the heater blower motor.

6. Connect the negative battery cable.

Windshield Wiper Motor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Disconnect the electrical connector from the wiper motor.

3. Remove the wiper motor bracket-to-chassis bolts.

4. Disconnect the wiper motor from the wiper linkage at the ball joint.

To install:

5. Connect the wiper motor to the wiper linkage at the ball joint.

6. Install the wiper motor-to-chassis bolts.

7. Connect the electrical connector to the wiper motor.

8. Connect the negative battery cable.

Windshield Wiper Switch

REMOVAL & INSTALLATION

Except 1988-90 Pick-Up and

Amigo

The windshield wiper switch is a part of the combination switch located on the steering column.

1988-90 Pick-Up and Amigo

The windshield wiper switch is a part of the switch cluster located on the left side of the instrument cluster.

1. Disconnect the negative battery cable.

2. Remove the instrument cluster-to-dash screws.

3. Pull the instrument cluster forward and disconnect the electrical connector from the switch cluster.

4. From the rear of the instrument cluster, loosen the switch cluster-to-instrument cluster bolts.

5. Separate the windshield wiper switch from the switch cluster.

To install:

6. Install the windshield wiper switch to the switch cluster.

7. Tighten the switch cluster-to-instrument cluster bolts.

8. Connect the electrical connector to the switch cluster.

9. Install the instrument cluster.

10. Connect the negative battery cable.

1. Solenoid valve
2. Diaphragm assembly
3. Door spring and lever
4. Blower motor assembly
5. Thermo sensor assembly
6. Seal
7. Attaching parts
8. Left side case
9. Right side case
10. Blower motor housing
11. Blower motor fan

Exploded view of the heater blower motor

1. Wiper arm assembly
2. Link pivot nut
3. Center cover
4. Left cover
5. Wiring connector
6. Wiper motor assembly with link assembly
7. Link joint
8. Tank assembly

Exploded view of the wiper motor and linkage assembly

Instrument Cluster

REMOVAL & INSTALLATION

Except 1988-90 Pick-Up and Amigo

1. Disconnect the negative battery cable.
2. Remove the steering wheel.
3. Remove the knob from the light switch.
4. Remove the cover-to-instrument panel screws and the cover.
5. Remove the instrument panel-to-dash screws and pull the panel forward.
6. Disconnect the electrical connectors and the speedometer cable from the rear of the instrument panel.
7. Remove the instrument panel from the vehicle.

To install:

8. Connect the speedometer cable and the electrical connectors to the

Removing the instrument cluster—Trooper/Trooper II shown—Pick-Up 1986-87 similar

rear of the instrument cluster.

9. Install the instrument cluster to the dash.

10. Install the cover to the instrument cluster.

11. Install the knob to the light switch.

12. Install the steering wheel.

13. Connect the negative battery cable.

1988-90 Pick-Up and Amigo

TILT STEERING WHEEL

1. Disconnect the negative battery cable.

2. Move the steering wheel to the fully down position.

3. Remove the instrument cluster-to-dash screws and pull the instrument cluster forward.

4. Disconnect the electrical connectors and the speedometer cable from the instrument cluster.

To install:

5. Connect the speedometer cable and electrical connectors to the instrument cluster.

6. Install the instrument cluster to the dash.

7. Connect the negative battery cable.

EXCEPT TILT STEERING WHEEL

1. Disconnect the negative battery cable.

2. Remove the steering wheel and the steering wheel cowl.

3. Remove the instrument cluster-to-dash screws and pull the instrument cluster forward.

4. Disconnect the electrical connectors and the speedometer cable from the instrument cluster.

To install:

5. Connect the speedometer cable and electrical connectors to the instrument cluster.

6. Install the instrument cluster to the dash.

7. Install the steering column cowl and the steering wheel.

8. Connect the negative battery cable.

Speedometer

REMOVAL & INSTALLATION

Except Trooper/Trooper II

The speedometer is a part of the instrument cluster.

Trooper/Trooper II

1. Disconnect the negative battery cable.

2. Remove the instrument cluster.

3. Remove the speedometer from the instrument cluster.

Exploded view of the speedometer – Trooper/Trooper II

To install:

4. Install the speedometer to the instrument cluster.

5. Install the instrument cluster.

6. Connect the negative battery cable.

Radio

REMOVAL & INSTALLATION

P'Up

1. Disconnect the negative battery cable.

2. Remove the knobs, the nuts and washers.

3. Remove the face plate from the radio.

4. Remove the cluster panel-to-dash screws and the panel.

5. Disconnect the harness connector and the feeder cable.

6. Remove the radio-to-bracket screws and the radio.

To install:

7. Install the radio and the radio-to-bracket screws.

8. Connect the feeder cable and the harness connector.

9. Install the cluster panel and the cluster panel-to-dash screws.

10. Install the radio faceplate.

11. Install the washers, nuts and knobs.

12. Connect the negative battery cable.

Trooper/Trooper II

1. Disconnect the negative battery cable.

2. Remove the knobs, the nuts and washers.

3. Remove the face plate from the radio.

4. Remove the radio shroud screws and the shroud.

5. Disconnect the harness connector and the feeder cable.

6. Remove the radio-to-bracket screws and the radio.

To install:

7. Install the radio and the radio-to-bracket screws.

8. Connect the feeder cable and the harness connector.

9. Install the radio shroud and screws.

10. Install the radio faceplate.

11. Install the washers, nuts and knobs.

12. Connect the negative battery cable.

1988-90 Pick-Up and Amigo

1. Disconnect the negative battery cable.

2. Remove the radio console-to-dash screws and the console.

3. Disconnect the harness connector and the feeder cable, if equipped.

4. Remove the radio bracket-to-radio screws.

5. Remove the radio.

To install:

6. Install the radio and the radio bracket-to-radio screws.

7. Connect the harness connector and the feeder cable, if equipped.

8. Install the console and the radio console-to-dash screws.

9. Connect the negative battery cable.

Headlight Switch

REMOVAL & INSTALLATION

Except 1988-90 Pick-Up and Amigo

The headlight switch is located on the lower left side of the dash.

1. Disconnect the negative battery cable.

2. Remove the headlight switch knob.

3. Disconnect and label the headlight switch wiring under the dashboard.

4. Remove the headlight switch locknut and the switch from the dash.

To install:

5. Install the switch to the dash and secure with the locknut.

6. Connect the electrical connector to the headlight switch.

7. Install the headlight switch knob.

8. Connect the negative battery cable.

1988-90 Pick-Up and Amigo

The push button headlight switch, is a part of the switch cluster located on the left side of the dash.

1. Disconnect the negative battery cable.

2. Remove the instrument cluster-to-dash screws.

3. Pull the instrument cluster forward and disconnect the electrical connector from the switch cluster.

4. From the rear of the instrument cluster, loosen the switch cluster-to-instrument cluster bolts.

5. Separate the headlight switch from the switch cluster.

To install:

6. Install the headlight switch to the switch cluster.

7. Tighten the switch cluster-to-instrument cluster bolts.

8. Connect the electrical connector to the switch cluster.

9. Install the instrument cluster.

10. Connect the negative battery cable.

Dimmer Switch

The dimmer switch is a part of the combination switch located on the steering column.

Turn Signal Switch

The turn signal switch is a part of the combination switch located on the steering column.

Combination Switch

REMOVAL & INSTALLATION

P'Up

1. Disconnect the negative battery cable.

2. From the rear of the steering wheel, remove the horn pad screw and lift the horn pad upward to remove it.

3. Disconnect the electrical connector from the horn pad.

4. Remove the steering wheel-to-steering column nut.

5. Matchmark the steering wheel to the steering shaft for reinstallation purposes.

NOTE: Never apply a blow to the steering wheel shaft with a hammer or other impact tool, to remove the steering wheel, for the steering shaft may become damaged.

6. Using a steering wheel puller, press the steering wheel from the steering column.

NOTE: Use steering wheel puller J-29752 (LS model) or J-24292-B (except LS model).

7. Remove the contact ring.

8. Remove the steering column covers.

9. Disconnect the electrical connector from the combination switch.

10. Remove the combination switch-to-steering column screws and the switch.

To install:

11. Install the combination switch to the steering column and secure it with screws.

12. Connect the combination switch electrical connector.

13. Install the steering column covers.

14. Install the contact ring.

15. Align the steering wheel-to-steering column matchmarks and torque the nut to 18–25 ft. lbs.

16. Connect the electrical connector to the horn pad.

17. Install the horn pad and the horn pad screw.

18. Connect the negative battery cable.

Except P'Up

1. Disconnect the negative battery cable.

2. From the rear of the steering wheel, remove the horn pad screw and lift the horn pad upward to remove it.

3. Remove the steering wheel-to-steering column nut.

4. Matchmark the steering wheel to the steering shaft for reinstallation purposes.

NOTE: Never apply a blow to the steering wheel shaft with a hammer or other impact tool, to remove the steering wheel, for the steering shaft may become damaged.

5. Using a steering wheel puller, press the steering wheel from the steering column.

6. Remove the contact ring.

7. Remove the steering column covers.

8. Disconnect the electrical connector from the combination switch.

9. Remove the combination switch-to-steering column screws and the switch.

To install:

10. Install the combination switch to the steering column and secure it with screws.

11. Connect the combination switch electrical connector.

12. Install the steering column covers.

13. Install the contact ring.

14. Align the steering wheel-to-steering column matchmarks and torque the nut to 22–29 ft. lbs.

15. Install the horn pad and the horn pad screw.

16. Connect the negative battery cable.

Ignition Lock/Switch

REMOVAL & INSTALLATION

Except 1988-90 Pick-Up and Amigo

IGNITION SWITCH

The ignition switch is located on the lower right side of the dash.

1. Disconnect the negative battery cable.

2. Disconnect and label the ignition switch wiring under the dashboard.

4. Remove the ignition switch locknut and the switch from the dash.

To install:

5. Install the ignition switch to the dash and secure with the locknut.

6. Connect the electrical connector to the ignition switch.

7. Connect the negative battery cable.

IGNITION LOCK

1. Remove the combination switch.

2. Remove the ignition lock-to-steering column clamp bolts and the ignition lock.

To install:

3. Install the ignition lock to the steering column and secure with bolts.

4. Install the combination switch.

1988-90 Pick-Up and Amigo

1. Disconnect the negative battery cable.

2. From the rear of the steering wheel, remove the horn pad screw and lift the horn pad upward to remove it.

3. Remove the steering wheel-to-steering column nut.

4. Matchmark the steering wheel to the steering shaft for reinstallation purposes.

NOTE: Never apply a blow to the steering wheel shaft with a hammer or other impact tool, to remove the steering wheel, for the steering shaft may become damaged.

5. Using a steering wheel puller, press the steering wheel from the steering column.

6. Remove the contact ring.

7. Remove the steering column covers.

8. Disconnect the electrical connector from the combination switch.

9. Remove the combination switch-to-steering column screws and the switch.

10. Remove the ignition lock/switch-to-steering column snapping and bushing.

11. Disconnect the electrical connector from the ignition lock/switch assembly.

1. Horn shroud
2. Nut
3. Steering wheel
4. Steering cowl
5. Combination switch
6. Snapring
7. Bushing
8. Steering lock and bearing
9. Steering assembly

Exploded view of the steering column—Amigo and Pick-Up 1988-90—others are similar

12. Remove the ignition lock/switch-to-steering column bolts and the lock/switch assembly.

To install:

13. Install the ignition lock/switch-to-steering column bolts, the bushing and the snapring.

14. Install the combination switch to the steering column and secure it with screws.

15. Connect the combination switch electrical connector.

16. Install the steering column covers.

17. Install the contact ring.

18. Align the steering wheel-to-steering column matchmarks and torque the nut to 22-29 ft. lbs.

19. Install the horn pad and the horn pad screw.

20. Connect the negative battery cable.

Stoplight Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Locate the stoplight switch on the brake pedal support.

3. Disconnect the electrical connector from the stoplight switch.

4. Remove the locknut and the stoplight switch.

To install:

5. Install the switch on the support and adjust the switch so there is 0.020-0.040 in. (0.5-1.0mm) clearance between the switch and the brake pedal.

6. Torque the locknut to 11-18 ft. lbs.

7. Connect the wiring to the switch and the negative battery cable.

8. Check the operation of the switch.

Fuses and Circuit Breakers

LOCATION

The main fuse box is located at the lower left side of the instrument panel.

The fuse/relay box is located at the right side of the engine compartment with the main fuse installed in it.

Fusible links are in a box located beside the battery.

ENGINE COOLING

Radiator

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Remove the upper, lower and reservoir hoses from the radiator.

4. Remove the fan shroud-to-radiator bolts and the shroud.

5. Remove the radiator-to-chassis bolts and the radiator.

To install:

6. Install the radiator and the radiator-to-chassis bolts.

7. Install the fan shroud and the shroud-to-radiator bolts.

8. Reconnect the radiator hoses.

9. Refill the cooling system.

10. Connect the negative battery cable.

Heater Core

REMOVAL & INSTALLATION

Except 1988-90 Pick-Up and Amigo

1. Disconnect the negative battery cable.
2. Place a drain pan under the heater hoses at the heater core. Remove the heater hoses from the heater core, securing the heater hoses in a raised position to prevent further loss of coolant. Plug the heater core tubes to prevent spillage of coolant in the passenger compartment when removing.
3. Remove the instrument panel-to-chassis screws and the panel.
4. If equipped with air conditioning, perform the following procedures:
 - a. Properly discharge the air conditioning system.
 - b. Remove the evaporator-to-compressor and receiver tank flare nuts.
 - c. Remove the vacuum hose.
 - d. Disconnect the connectors from the evaporator relay.
 - e. Remove the evaporator-to-chassis nuts and the evaporator.
5. If not equipped with air conditioning, remove the heater unit assembly-to-blower unit assembly duct.

6. Remove the air ducts from the heater unit assembly.
7. Disconnect the mechanical and electrical connectors from the heater unit relay.
8. Remove the heater unit assembly-to-chassis nuts and the assembly.

To install:

9. Install the heater unit assembly and secure with the nuts.
10. Connect the mechanical and electrical connectors to the heater unit relay.
11. Install the air ducts to the heater unit assembly.
12. If not equipped with air conditioning, install the heater unit assembly-to-blower unit assembly duct.
13. If equipped with air conditioning, perform the following procedures:
 - a. Install the evaporator and the evaporator-to-chassis nuts.
 - b. Connect the connectors to the evaporator relay.
 - c. Install the vacuum hose.
 - d. Install the evaporator-to-compressor and receiver tank flare nuts.
14. Evacuate and recharge the air conditioning system.
15. Install the panel and secure with the instrument panel-to-chassis screws.
16. Install the heater hoses to the heater core.

17. Connect the negative battery cable.

18. If equipped with air conditioning, recharge the air conditioning system.

1988-90 Pick-Up and Amigo

1. Disconnect the negative battery cable.
2. Place a drain pan under the heater hoses at the heater core. Remove the heater hoses from the heater core, securing the heater hoses in a raised position to prevent further loss of coolant. Plug the heater core tubes to prevent spillage of coolant in the passenger compartment when removing.
3. Remove the instrument panel-to-chassis screws and the panel.
4. Disconnect electrical connectors from the resistor.
5. Remove the evaporator-to-compressor and receiver tank flare nuts.
6. Properly discharge the air conditioning system.
7. Remove the evaporator-to-chassis nuts and the evaporator.
8. Remove the side ventilator air ducts.
9. Remove the heater unit assembly-to-chassis nuts and the assembly.

To install:

10. Install the heater unit assembly and secure with the nuts.

1. Evaporator-to-compressor flare nuts
- 1A. Non-air conditioning duct
2. Vacuum hose
3. Evaporator relay connectors
4. Evaporator nuts
5. Evaporator assembly
6. Heater hose
7. Heater hose
8. Air duct
9. Heater unit relay connectors
10. Heater unit nuts
11. Heater unit assembly

12. Blower unit connectors and vacuum hose
13. Blower unit nuts
14. Blower unit assembly

Exploded view of the heater/air conditioning system—except Amigo and Pick-Up 1989-90

1. Evaporator-to-compressor flare nuts
2. Resistor connectors
3. Evaporator nuts
4. Evaporator assembly
5. Heater hose
6. Heater hose
7. Side ventilator duct
8. Heater unit nuts
9. Heater unit assembly
10. Blower unit nuts/bolts
11. Blower unit assembly

Exploded view of the heater/air conditioning system—Amigo and Pick-Up 1989-90

11. Install the side ventilator air ducts.
12. Install the evaporator and the evaporator-to-chassis nuts.
13. Connect the electrical connector to the resistor.
14. Install the evaporator-to-compressor and receiver tank flare nuts.
15. Install the instrument panel and secure with the panel-to-chassis screws.
16. Install the heater hoses to the heater core.
17. Connect the negative battery cable.
18. Recharge the air conditioning system.

Water Pump

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the undercover, if equipped, and drain the cooling system.
3. Remove the drive belt from the water pump pulley.
4. If equipped with a diesel engine, remove the coolant hose from the pump body.
5. Remove the fan blade and pulley

from the pump hub.

6. Remove the water pump-to-engine bolts, the water pump and gasket.

7. Clean and inspect the mounting surfaces of the water pump and engine.

To install:

8. Install a new gasket and the water pump; torque the water pump-to-engine bolts to 17-19 ft. lbs. (2.0L engine), 10-17 ft. lbs. (2.3L and 2.6L engines) or 24-38 ft. lbs. (2.2L diesel engine).

9. Install the fan blade and pulley to the water pump.

10. If equipped with a diesel engine, connect the water hose to the pump.

11. Install and adjust the drive belt.

12. Refill the cooling system and install the undercover, if equipped.

13. Connect the negative battery cable.

14. Operate the engine to normal operating temperatures and check for leaks.

Thermostat

REMOVAL & INSTALLATION

Gasoline Engine

The thermostat is located, under the

thermostat housing, on top of the intake manifold at the front of the engine.

1. Disconnect the negative battery cable.

2. Drain the cooling system. Disconnect the upper radiator hose from the thermostat housing.

3. Remove the air cleaner assembly.

4. Remove the thermostat housing from the intake manifold.

5. Remove the gasket and the thermostat.

To install:

6. Install the thermostat, with the spring facing the engine.

7. Using a new gasket, install the thermostat housing.

8. Connect the radiator hose to the thermostat housing and refill the cooling system.

9. Install the air cleaner.

10. Connect the negative battery cable.

11. Operate the engine until normal operating temperatures are reached and check the thermostat operation.

Diesel Engine

The thermostat is located, under the

thermostat housing, at upper front of the engine.

1. Disconnect the negative battery cable.
2. Drain the cooling system.
3. Disconnect the electrical connectors from the thermostat housing.
4. Remove the upper thermostat housing-to-lower housing bolts and the upper housing.
5. Remove the gasket and the thermostat.
6. Clean the gasket mounting surfaces.

To install:

7. Install the thermostat, with the spring facing the engine.
8. Using a new gasket, install the upper thermostat housing and torque the upper housing-to-lower housing bolts to 10–17 ft. lbs.
9. Connect the electrical connectors.
10. Connect the radiator hose to the thermostat housing and refill the cooling system.
11. Connect the negative battery cable.
12. Operate the engine until normal operating temperatures are reached and check the thermostat operation.

GASOLINE FUEL SYSTEM

Fuel System Service Precaution

Disconnect the negative battery cable. Keep a Class B dry chemical fire extinguisher available. Always relieve the fuel pressure before disconnecting a fuel line. Wrap a shop cloth around the fuel line when disconnecting a fuel line. Always use new O-rings. Do not replace the fuel pipes with fuel hoses. Always use a back-up wrench when opening or closing a fuel line.

RELIEVING FUEL SYSTEM PRESSURE

Carbureted Engine

1. Release the fuel vapor pressure in the fuel tank by removing the fuel tank cap and reinstalling it.
2. Cover the fuel line with an absorbent shop cloth and loosen the connection slowly to release the fuel pressure gradually.

Fuel Injected Engine

1. Allow the engine to cool. Then, remove the fuel pump fuse from the fuse block.

2. Crank the engine, it will start and run until the fuel supply remaining in the fuel lines is exhausted. When the engine stops, engage the starter again for 3.0 seconds to assure dissipation of any remaining pressure.
3. With the ignition OFF, replace the fuel pump fuse.

Fuel Filter

On the P'UP, Amigo and Pick-Up, the fuel filter is located directly in front of the fuel tank. On the Trooper/Trooper II, the fuel filter is located along the inner side of the right frame rail, near the rear of the vehicle.

REMOVAL & INSTALLATION

1. Properly relieve the fuel system pressure.
 2. Raise and safely support the vehicle.
 3. Using 2 pairs of vise grips, pinch off the fuel line on each side of the fuel filter.
 4. Remove the fuel hose clamps and the fuel hoses from each side of the filter.
 5. Remove the mounting bolt and the filter.
- To install:**
6. Using a new filter, install it to the vehicle; be sure its directional arrow faces forward.
 7. Install the fuel hoses and fuel hose clamps to the filter.
 8. Remove the vise grips.
 9. Start the engine and check for leaks at the filter.

Mechanical Fuel Pump

REMOVAL & INSTALLATION

2.0L Engine

The fuel pump is located beside the distributor at the right, front side of the engine.

1. Relieve the fuel pressure.
 2. Disconnect the negative battery cable.
 3. Remove the distributor cap, with the wires attached and the distributor assembly.
 4. Disconnect and plug the fuel lines from the fuel pump.
 5. Remove the engine hanger.
 6. Remove the fuel pump-to-engine bolts and remove the pump assembly.
- To install:**
7. Using a new gasket, install the fuel pump on the engine.
 8. Install the engine hanger.
 9. Unplug and connect the fuel lines to the fuel pump.
 10. Install the distributor and the distributor cap.

11. Connect the negative battery cable.
12. Start the engine and check for fuel leaks.

2.3L Engine

The fuel pump is located at the right side of the engine, directly under the intake manifold.

1. Relieve the fuel pressure.
 2. Disconnect the negative battery cable.
 3. Remove the air cleaner assembly.
 4. Remove the intake manifold assembly.
 5. Disconnect and plug the fuel lines at the fuel pump.
 6. Remove the fuel pump-to-engine bolts and the pump assembly.
- To install:**
7. Remove the cylinder head cover.
 8. Rotate the engine to position the No. 4 cylinder at TDC.
 9. Lift the fuel pump pushrod toward the camshaft and hold it in the raised position.
 10. Using a new gasket, install the fuel pump on the engine; torque the bolts to 15–25 ft. lbs. (20–4 Nm).
 11. Connect the fuel hoses to the fuel pump.
 12. Using a new gasket, install the intake manifold.
 13. Install the air cleaner assembly.
 14. Connect the negative battery cable.
 15. Start the engine and check for fuel leaks.

Electric Fuel Pump

PRESSURE TESTING

1. Relieve the fuel pressure.
2. Disconnect the fuel line near the engine and install fuel pressure gauge T-connector in the line.
3. Connect the fuel pressure gauge to the T-connector.
4. Start the engine and check the fuel pressure; it should be 43 psi (2.6L engine) or 9–13 psi (2.8L engine).
5. After checking, turn the engine OFF.
6. Relieve the fuel pressure.
7. Remove the pressure gauge from the fuel line and reconnect the fuel line.
8. Start the engine and check for leaks.

REMOVAL & INSTALLATION

The electric fuel pump is located in the fuel tank.

2.6L and 2.8L Engines

1. Relieve the fuel pressure.

2. Disconnect the negative battery cable.
3. Raise and safely support the vehicle.
4. Drain the fuel from the fuel tank.
5. Disconnect the electrical connectors and the fuel lines from the fuel tank.
6. Remove the fuel tank-to-vehicle supports and lower the tank from the vehicle.
7. Remove the fuel sending unit cover-to-fuel tank screws and lift the assembly from the tank.
8. Remove the fuel pump from the fuel sending unit.

To install:

9. Install the fuel pump to the fuel sending unit.
10. Using a new gasket, install the fuel sending unit to the fuel tank and tighten the screws.
11. Raise the fuel tank into the vehicle and install the tank-to-chassis connectors.
12. Connect the electrical connectors and the fuel lines to the fuel sending unit.
13. Lower the vehicle.
14. Refill the fuel tank.
15. Connect the negative battery cable.
16. Start the engine and check for fuel leaks.

Carburetor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the air cleaner wing nut and disconnect the rubber hoses from the clips on the air cleaner cover.
3. Remove the bracket bolts, if equipped, at the air cleaner and remove the air cleaner cover and filter element.
4. Disconnect the hot air hose (to the hot air duct), the air hose to the air pump at the air cleaner and the vacuum hose at the joint nipple side of the intake manifold.
5. Loosen the bolt clamping the air cleaner to the carburetor. Separate the air cleaner body from the carburetor but do not remove it completely.
6. Disconnect the PCV hose (to the camshaft cover), the rubber hoses to the check and relief valve. Remove the air cleaner body.
7. Disconnect the vacuum hoses from the EGR valve.
8. Disconnect the choke control wire.
9. Disconnect the lead from the throttle solenoid.
10. Disconnect the throttle linkage return spring.

11. Disconnect the accelerator linkage.
12. Disconnect the fuel line at the carburetor.
13. Remove the carburetor-to-manifold nuts and the carburetor.

To install:

14. Using a new gasket, install the carburetor to the intake manifold.
15. Connect the fuel line and the accelerator linkage to the carburetor.
16. Connect the throttle linkage return spring, the throttle solenoid lead, the choke control wire and the vacuum hoses to the EGR and the PCV.
17. Install the air cleaner and any necessary hoses.
18. Start the engine and check for fuel leaks.

IDLE SPEED ADJUSTMENT

1. Firmly set the parking brake and block the drive wheels.

View of the idle and throttle adjusting screws—carbureted models

2. Place the transmission in N.
3. Operate the engine until it reaches normal operating temperatures. Be sure the choke is fully open and the air cleaner is installed. If equipped, turn the air conditioning OFF.
4. Disconnect and plug the distributor vacuum, the canister purge and EGR vacuum lines. Shut off the vacuum to the idle compensator by bending the rubber hose.
5. Turn the throttle adjusting screw to the required idle speed.
6. If equipped with air conditioning, turn air conditioning control to **MAX COLD** and the blower on **HIGH**.
7. Open throttle to approximately $\frac{1}{8}$ opening and allow it to close.

NOTE: The speed-up solenoid should reach full travel.

8. Adjust the speed-up solenoid screw to 850–950 rpm.

IDLE MIXTURE ADJUSTMENT

1986-87 Federal

1. Firmly set the parking brake and block the drive wheels.

2. Place the transmission in N.
3. Remove the carburetor assembly.
4. Using a drill, drill a hole through the sealing plug covering the idle mixture screw and pry the plug from the carburetor.
5. Reinstall the carburetor.
6. Operate the engine until it reaches normal operating temperatures. Be sure the choke is fully open and the air cleaner is installed. If equipped, turn the air conditioning OFF.

7. Disconnect and plug the distributor vacuum, the canister purge and EGR vacuum lines. Shut off the vacuum to the idle compensator by bending the rubber hose.

8. Turn the throttle adjusting screw until the engine speed is 750–850 rpm (manual transmission) or 850–950 rpm (automatic transmission).

9. Turn the idle mixture screw all the way in and back out 3 turns.

10. Turn the throttle adjusting screw until the engine speed is 800 rpm (manual transmission) or 900 rpm (automatic transmission).

11. Adjust the idle mixture screw to achieve the maximum speed.

12. Reset the throttle adjusting screw until the engine speed is 850 rpm (manual transmission) or 950 rpm (automatic transmission).

13. Turn the idle mixture screw counter-clockwise (lean) until the engine speed is 750–850 rpm (manual transmission) or 850–950 rpm (automatic transmission).

14. Reinstall a mixture adjustment plug.

Removing the sealing plug from the idle mixture screw—carbureted models

Except 1986-87 Federal

1. Firmly set the parking brake and block the drive wheels.
2. Place the transmission in N.
3. Remove the carburetor assembly.
4. Using a drill, drill a hole through the sealing plug covering the idle mixture screw and pry the plug from the carburetor.
5. Reinstall the carburetor.
6. Operate the engine until it reaches normal operating temperatures.

tures. Be sure the choke is fully open and the air cleaner is installed. If equipped, turn the air conditioning OFF.

7. Disconnect and plug the distributor vacuum, the canister purge and EGR vacuum lines. Shut off the vacuum to the idle compensator by bending the rubber hose.

8. Connect a dwell meter (4 cyl. scale) or duty meter to the duty monitor lead.

9. Turn the idle mixture screw all the way in and back out 1½ turns.

10. Turn the throttle adjusting screw until the engine speed is 950 rpm (1986-87) or 900 rpm (1988-90).

11. Adjust the idle mixture screw to achieve an average dwell of 36 degrees or duty of 40 percent.

NOTE: The dwell or duty reading specified is the average of the most constant variation.

12. Reset the throttle adjusting screw until the engine speed is 850-950 rpm.

13. Reinstall a mixture adjustment plug.

SERVICE ADJUSTMENTS

For all carburetor service adjustment procedures and Specifications, please refer to "Carburetor Service" in the Unit Repair section.

Fuel Injection

IDLE SPEED ADJUSTMENT

2.6L Engine

1. Firmly set the parking brake and block the drive wheels.
2. Place the transmission in N.
3. Set the engine tachometer.
4. Make sure the throttle valve is fully closed.
5. If equipped with air conditioning, turn OFF the air conditioning.

Location of the vacuum switching valve (VSV) electrical connector—2.6L engine

6. Place the manual transmission in N or the automatic transmission in P.

7. Disconnect the electrical connector from the vacuum switching valve (VSV) on the pressure regulator; the idle speed should 850-950 rpm.

8. If the idle speed is not correct, turn the adjusting screw A on the throttle body.

2.8L Engine

The idle speed is controlled by the ECM and no adjustment is necessary or possible.

IDLE MIXTURE ADJUSTMENT

No idle mixture adjustment is necessary or possible.

Fuel Injector

REMOVAL & INSTALLATION

2.6L Engine

The engine is equipped 4 fuel injectors, with one located at each cylinder.

1. Relieve the fuel pressure.
2. Disconnect the negative battery cable.
3. Label and disconnect the electrical connectors from the fuel injectors.

4. Disconnect the fuel rail from the fuel system.

5. Remove the fuel rail from the intake manifold; pull the fuel rail with the injectors connected from the intake manifold.

6. Separate the fuel injectors from the fuel rail.

To install:

7. Replace the fuel injector O-rings.

8. Install the fuel injectors to the fuel rail.

9. Lubricate the fuel injector O-rings with automatic transmission fluid and press them, with the fuel rail, into the intake manifold.

10. Install the fuel rail-to-intake manifold bolts.

11. Connect the fuel rail to the fuel system.

12. Connect the electrical connectors to the fuel injectors.

13. Connect the negative battery cable.

14. Turn the ignition switch ON and check for fuel leaks at the fuel rail.

2.8L Engine

The engine is equipped with 2 fuel injectors, both are located in the throttle body.

1. Relieve the fuel pressure.
2. Disconnect the negative battery cable.
3. Remove the air cleaner.

1. Fuel meter cover gasket
2. Removing fuel injector

Removing the fuel injectors from the throttle body—2.8L engine

View of the throttle body adjusting screw to alter the idle speed—2.6L engine

4. At the injector electrical connectors, squeeze the 2 tabs together and pull them straight upward.

5. Remove the fuel meter cover and leave the cover gasket in place.

6. Using a small pry bar, carefully pry the injectors upward until they are free of the throttle body.

7. Remove the small O-ring from the nozzle end of the injector. Carefully rotate the injector's fuel filter back-and-forth to remove it from the base of the injector.

8. Discard the fuel meter cover gasket.

9. Remove the large O-ring and back-up washer from the top of the counterbore of the fuel meter body injector cavity.

To install:

10. Lubricate the O-rings with automatic transmission fluid and push them into the fuel injector cavities.

11. Install the new fuel meter cover gasket and cover.

12. Install the electrical connectors to the injectors.

13. Install the air cleaner and connect the negative battery cable.

NOTE: When removing the fuel filter, be careful not to spill the fuel from the cartridge.

4. Drain the fuel cartridge and remove the sensor from the cartridge.

To install:

5. Lubricate the new sensor O-ring with diesel fuel and install the sensor onto the cartridge.

6. Lubricate the cartridge O-ring with diesel fuel. Install the cartridge until the O-ring contacts the sealing surface face, then, tighten the cartridge $\frac{2}{3}$ of a turn with a filter wrench.

7. Connect the electrical connector to the sensor.

8. Depress the priming pump, located on top of the cartridge, 30–40 times to fill the cartridge.

NOTE: The pumping force will increase as the filter becomes filled.

9. Start the engine and check for leakage around the sealing portions.

DRAINING WATER FROM THE SYSTEM

1. Using a 0.2L (0.05 gal) container, place it at the end of the vinyl hose, located under the drain plug of the separator.

2. Loosen the drain plug 5 turns.
3. Depress the priming pump about 10 times until the water is drained from the filter.

4. Tighten the drain plug.

5. Depress the priming pump several times.

6. Start the engine and check for leakage around the drain plug.

7. Make sure the **FILTER** light remains out.

Diesel Injection Pump

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the timing belt cover.

3. Remove the fuel lines and disconnect the electrical connectors from the fuel injector.

4. Using a pry bar, remove the tension spring from the timing belt tensioner.

NOTE: When removing the tension spring, avoid using excessive force for the spring may become distorted.

5. Remove the tensioner pulley bolt and the pulley.

DIESEL FUEL SYSTEM

Fuel System Service Precaution

Disconnect the negative battery cable. Keep a Class B dry chemical fire extinguisher available. Always relieve the fuel pressure before disconnecting a fuel line. Wrap a shop cloth around the fuel line when disconnecting a fuel line. Always use new O-rings. Do not replace the fuel pipes with fuel hoses. Always use a back-up wrench when opening or closing a fuel line.

Fuel Filter

The fuel filter is located near the battery.

REMOVAL & INSTALLATION

1. Properly relieve the fuel system pressure. Disconnect the negative battery cable.

2. Disconnect the water separator sensor wire from the connector.

3. Using a filter wrench, remove the fuel filter.

Exploded view of the Injection pump and pulley assembly—diesel engine

6. Remove the timing belt and discard it.

7. Using a 6mm, 1.25 pitch bolt, install the threaded portion into the threaded hole in the timing pulley housing through the hole in the pulley to prevent the pulley from turning.

8. Remove the injection pump pulley-to-shaft bolts.

9. Using a wheel puller, connect it to the injection pump pulley and press it from the shaft.

10. Remove the injection pump bracket-to-timing pulley housing bolts, the rear injection pump-to-bracket bolts and the injection pump. **To install:**

11. Install the injection pump. Tighten the injection pump-to-timing pulley housing bolts and leave the rear pump-to-bracket bolts semi-tight.

12. Install the injection pump pulley by aligning it with the key groove and torque the bolt to 42-52 ft. lbs.

13. Rotate the crankshaft to bring the No. 1 piston to TDC of the compression stroke.

14. Align the timing marks on the injection pump pulley with the camshaft pulley; the marks must be facing each other.

15. Using a new timing belt, install it in the following sequence: crankshaft pulley, camshaft pulley and the injection pump pulley; the slack must be between the injection pump and camshaft pulleys.

16. Install the tension center and the tension pulley so the end of the tension

Turning the crankshaft 90 degrees beyond TDC—diesel engine

center is fitted against both pins on the timing pulley housing.

17. Hand tighten the nut so the tension pulley can be rotated freely.

18. Install the tension spring and semi-tighten the pulley nut to 22-36 ft. lbs.

19. Rotate the crankshaft 2 full turns clockwise to seat the belt and further turn the crankshaft 90 degrees beyond TDC to settle the injection pump.

20. Loosen the tension pulley nut to take up the timing belt slack. Tighten the tension pulley nut to 79-94 ft. lbs.

21. Install the injection pump pulley flange; the hole in the outer circumference of the flange should be aligned with the triangular timing mark on the injection pump pulley.

22. Rotate the crankshaft 2 full turns clockwise to bring the No. 1 piston to TDC of the compression stroke. Make sure the triangular timing mark on the timing pulley is aligned with the hole in the flange, then, measure the timing belt tension; it should be 33-55 lbs.

23. Install the timing belt cover.

24. Connect the negative battery cable.

Aligning the injection pump pulley with the camshaft pulley timing marks—diesel engine

Aligning the injection pump flange with the camshaft pulley timing marks—diesel engine

Installing the timing belt—diesel engine

3. Operate the engine until it reaches normal operating temperatures.

4. Turn the air conditioning OFF and be sure the air cleaner is installed.

5. Connect a tachometer to the fuel injection pump connector and check the idle speed; it should be 700-800 rpm.

6. If the idle speed is not correct, loosen the locknut and turn the adjusting screw in and out until the speed is correct, then, tighten the locknut.

7. Turn the engine OFF. Remove the tachometer and wheel blocks.

View of the slow idle speed adjusting screw and locknut—diesel engine

Fast Idle

View of the fast idle speed adjusting screw and locknut—diesel engine

View of the vacuum switch and hoses—fast idle adjustment—diesel engine

IDLE SPEED ADJUSTMENT

Slow Idle

1. Firmly, set the parking brake and block the drive wheels.

2. Place the transmission in N.

1. Firmly, set the parking brake and block the drive wheels.

2. Place the transmission in N.

3. Operate the engine until it reaches normal operating temperatures.

4. Turn the air conditioning **OFF** and be sure the air cleaner is installed.

5. Disconnect both vacuum hoses from the vacuum switch valve.

6. Using a short, 4mm pipe, install it between the vacuum hoses.

7. Connect a tachometer to the fuel injection pump connector and check the fast idle speed; it should be 900–950 rpm.

8. If the idle speed is not correct, loosen the locknut (4) and turn the adjusting screw (3) until the fast idle speed is correct, then, tighten the locknut (4).

9. Turn the engine **OFF**. Remove the tachometer and wheel blocks.

10. Remove the pipe from the vacuum hoses and reconnect the hoses to the vacuum switch.

Diesel Injection Timing

ADJUSTMENT

1. Make sure the notched line on the injection pump flange is aligned with the notched line on the injection pump's front bracket.

2. Rotate the crankshaft to bring the No. 1 piston to TDC; the timing pointer should be aligned with the timing notch on the crankshaft pulley.

View of the Injection pump-to-bracket alignment marks—diesel engine

3. Remove the timing pulley housing cover and check that the timing belt is properly tensioned and the timing marks on the pulleys are aligned.

4. Disconnect the injection pipe from the injection pump, remove the distributor head screw and install a static timing gauge.

5. Adjust the lift to approximately 0.04 in. (1mm) from the plunger.

NOTE: Use a wrench to hold the delivery holder when loosening the sleeve nuts on the side of the injection pipe.

6. Rotate the crankshaft to position the No. 1 cylinder to 45–60 degrees BTDC, then, calibrate the dial indicator to zero.

View of the timing marks—diesel engine

7. Rotate the crankshaft, in the normal direction of rotation, to 10 degrees BTDC and read the dial indicator; the standard reading should be 0.020 in. (0.5mm).

8. If the reading is not correct, loosen the injection pump-to-bracket flange nuts and move the pump to a position where the reading is 0.020 in. (0.5mm) and tighten the nuts.

9. Remove the static timing gauge, install the injection pipe and plug to the injection pump.

Fuel Injector

REMOVAL & INSTALLATION

1. Relieve the fuel system pressure.

2. Remove the fuel pressure line(s) and return line(s) from the fuel injector(s).

3. Remove the fuel injector(s) from the engine.

4. Remove the O-rings from the fuel injector.

To install:

5. Using new O-rings, lubricate them in diesel fuel and install them onto the fuel injector(s).

6. Install the fuel injector(s) into the engine.

7. Using new O-rings, install the fuel pressure line(s) and return line(s) onto the fuel injector(s).

View of the static timing gauge install on the injection pump—diesel engine

View of the timing marks with the No. 1 piston at 45–60 degrees BTDC—diesel engine

EMISSION CONTROLS

Please refer to "Emission Control" in the Unit Repair section for system maintenance procedures. Due to the complex nature of modern electronic engine control systems, comprehensive diagnosis and testing procedures fall outside the confines of this repair manual. For complete information on diagnosis, testing and repair procedures concerning all modern engine and emission control systems, please refer to "Chilton's Guide to Electronic Engine Controls".

Emission Warning Lamps

RESETTING

Once the problem in the system is corrected, the trouble codes must be cleared from the ECM memory. The Check Engine light can be reset by disconnecting the negative battery cable or the ECM fuse at the fuse box for at least 10 seconds and then reconnecting the cable.

GASOLINE ENGINE MECHANICAL

NOTE: Disconnecting the negative battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is reconnected.

Engine

REMOVAL & INSTALLATION

2wd Vehicles

1986-87

1. Disconnect both battery cables, the negative cable first.

2. Matchmark the hood-to-hinges and remove the hood.

3. Remove the undercover, if equipped. Open the drain plugs on the radiator and the cylinder and drain the cooling system.

4. Remove the air cleaner by performing the following procedures:

a. Disconnect the air duct and PCV hose from the air cleaner.

b. Disconnect the air hose from the AIR pump.

c. Remove the air cleaner-to-bracket bolts and wing nut.

d. Lift the air cleaner, disconnect the vacuum hose(s) from the under side and remove the air cleaner.

e. Using a clean shop cloth, cover the air cleaner port to prevent dirt from entering the engine.

5. Disconnect the TCA hot air hose and remove the manifold cover.

6. Label and disconnect the electrical connector(s) from the alternator.

7. Remove the exhaust pipe-to-exhaust manifold nuts and separate the pipe from the manifold.

8. Loosen the clutch cable adjusting nut and relieve the tension, if equipped with a manual transmission.

9. Disconnect the heater hoses from the heater core.

10. If equipped with an oxygen sensor, disconnect the electrical connector.

11. If equipped with a vacuum switching valve, disconnect the rubber hose from the valve.

12. Disconnect the engine-to-chassis ground cable.

13. Disconnect the fuel hoses from the carburetor.

14. Disconnect the high-tension wire from the ignition coil, the vacuum hose from the rear connector of the intake manifold and the rubber hoses

from the canister.

15. Disconnect the accelerator cable from the carburetor. Disconnect the electrical connectors from the starter, the thermo-unit, the oil pressure switch and distributor harness.

16. Disconnect the hose from the vacuum switch, if equipped, and the solenoid valve.

17. Disconnect the electrical connectors from the EFE heater, the carburetor solenoid valve and the electric choke.

18. From the rear of the engine, disconnect the back-up light switch and transmission wiring at the connector.

19. Using an engine hoist, connect it to the engine hangers and support the engine.

20. Remove the engine-to-mount nut. Raise the engine slightly and remove the left side engine mount stopper plate.

21. If equipped with air conditioning, remove the compressor from the engine and move it aside; do not disconnect the pressure hoses.

22. Disconnect the upper and lower radiator hoses and the reservoir tank hose.

23. Remove the radiator and fan blade assembly.

24. Raise and safely support the vehicle. Drain the oil from the engine.

25. Remove the clutch return spring and the clutch cable, if equipped with a manual transmission.

26. Remove the starter motor. Disconnect the speedometer from the transmission.

27. Matchmark and remove the driveshaft. Remove the transmission mount bolts. Remove gearshift lever assembly.

28. Lift the engine slightly. Remove the exhaust pipe bracket from the transmission and the engine-to-mount nuts.

29. Make certain that all lines, hoses, cables and wires have been disconnected from the engine and frame.

30. Lift the engine/transmission assembly from the vehicle with the front of the engine raised slightly.

31. Remove the transmission-to-engine bolts and the transmission from the engine.

To install:

32. Lower the engine/transmission assembly into the vehicle, align it with the mounts and install the nuts/bolts.

33. Install the gearshift lever assembly and the driveshaft.

34. Connect the speedometer cable to the transmission. Install the starter motor.

35. If equipped with a manual transmission, install the clutch cable and clutch return spring.

36. Lower the vehicle. Install the fan blade assembly and the radiator.

37. Connect the upper and lower radiator hoses and the reservoir tank hose.

38. If equipped with air conditioning, install the compressor to the engine.

39. Install the left side engine mount stopper plate, lower the engine slightly and install the engine-to-mount nut.

40. Remove the engine hoist.

41. Connect the electrical connector to the back-up light switch and transmission wiring connector at the rear of the engine.

42. Connect the electrical connectors to the EFE heater, the carburetor solenoid valve and the electric choke.

43. Connect the hose to the vacuum switch, if equipped, and the solenoid valve.

44. Connect the accelerator cable to the carburetor. Connect the electrical connectors to the starter, the thermo-unit, the oil pressure switch and distributor harness.

45. Connect the high-tension wire to the ignition coil, the vacuum hose to the rear connector of the intake manifold and the rubber hoses to the canister.

46. Connect the fuel hoses to the carburetor.

47. Connect the engine-to-chassis ground cable.

48. If equipped with a vacuum switching valve, connect the rubber hose to the valve.

49. If equipped with an oxygen sensor, connect the electrical connector.

50. Connect the heater hoses to the heater core.

51. Tension the clutch cable and tighten the adjusting nut, if equipped with a manual transmission.

52. Install the exhaust pipe-to-exhaust manifold nuts.

53. Connect the electrical connector(s) to the alternator.

54. Install the manifold cover and connect the TCA hot air hose.

55. Install the air cleaner by performing the following procedures:

a. Lower the air cleaner and connect the vacuum hose(s) to the underside.

b. Install the air cleaner-to-bracket bolts and wing nut.

c. Connect the air hose to the AIR pump.

d. Connect the air duct and PCV hose to the air cleaner.

56. Refill the cooling system with the proper coolant and the crankcase with engine oil. Check and adjust the clutch pedal freeplay, if equipped with a manual transmission.

57. Install the hood and connect both battery cables, the positive cable first.

58. Adjust the belt tension. Start the engine, check for leaks.

59. Check and/or adjust the idle speed and ignition timing.

1988-90

1. Relieve the fuel pressure. Disconnect both battery cables, the negative cable first. Remove the battery.

2. Matchmark the hood-to-hinges and remove the hood.

3. Remove the undercover, if equipped. Open the drain plugs on the radiator and the cylinder and drain the cooling system.

4. Remove the air cleaner (2.3L engine) or air cleaner duct and hose (2.6L engine). Using a clean shop cloth, cover the air cleaner port to prevent dirt from entering the engine.

5. Label and disconnect the necessary hoses, electrical connectors, control cables and control rods from the engine.

6. Label and disconnect the following items:

- Air switch valve hose.
- Oxygen sensor wire.
- Vacuum switch valve hose.
- Thermal vacuum switching valve hose.
- Pressure regulator vacuum hose.
- Canister hose.
- ECM harness.
- Fuel hose(s).

7. Remove the clutch return spring (if equipped), the clutch control cable (if equipped), the back-up light switch connector and the speedometer cable from the transmission.

8. Remove the radiator grille from the deflector panel.

9. Disconnect the upper and lower radiator hoses and the reservoir tank hose.

10. Remove the fan shroud, fan blade assembly and the radiator.

11. If equipped with air conditioning, remove the compressor from the engine and move it aside; do not disconnect the pressure hoses.

12. Remove the gear shift lever by performing the following procedures:

- Place the gear shift lever in N.
- Remove the front console from the floor panel.
- Pull the shift lever boot and grommet upward.
- Remove the shift lever cover bolts and the shift lever.

13. Raise and safely support the vehicle. Remove the front wheels.

14. Drain the oil from the engine and the transmission fluid.

15. If equipped with an automatic transmission, perform the following procedures:

- Remove the oil level gauge and the tube.
- Disconnect the shift select control link rod from the select lever.
- Disconnect the downshift cable from the transmission.
- Disconnect and plug the fluid coolant lines from the transmission.

16. If equipped with a 1-piece driveshaft, remove the driveshaft flange-to-pinion nuts, lower the driveshaft and pull it from the transmission.

17. If equipped with a 2-piece driveshaft, perform the following procedures:

- Remove the rear driveshaft flange-to-pinion nuts.
- Remove the rear driveshaft flange-to-front driveshaft flange bolts and the rear driveshaft.
- Remove the center bearing-to-chassis bolts, move the front driveshaft rearward and from the transmission.

18. Remove the starter-to-engine bolts and the starter.

19. Remove the exhaust pipe-to-exhaust manifold nuts, the exhaust pipe bracket-to-transmission bolts, the front exhaust pipe-to-2nd exhaust pipe bolts and the front exhaust pipe from the vehicle.

20. Attach an engine hanger to the rear of the exhaust manifold.

21. Using an engine hoist, connect it to the engine hangers and support the engine.

22. If equipped with a manual transmission, perform the following procedures:

- Using a transmission jack, place it under the transmission; do not support it.
- Remove the rear mount-to-transmission nuts.
- Remove the rear mount-to-crossmember nuts/bolts and the mount.

NOTE: Further removal of the transmission may require an assistant.

d. Remove the clutch cover and the transmission-to-engine bolts.

e. Move the transmission rearward into the crossmember and floor pan area; the transmission may rest on the crossmember.

f. Lower the front of the transmission toward the jack.

g. Firmly, grasp the transmission the rear cover while the assistant raises the jack toward the transmission.

h. Carefully lower the transmission onto the jack and center it.

i. Lower the jack and move the transmission rearward.

23. If equipped with an automatic transmission, perform the following procedures:

NOTE: Removal of the transmission will require an assistant.

a. Remove the torque converter-to-flex plate bolts through the starter hole.

b. Using a transmission jack, place it under the transmission; do

not support it.

c. Remove the rear mount-to-transmission nuts.

d. Remove the rear mount-to-crossmember nuts/bolts and the mount.

e. Remove the transmission-to-engine bolts.

f. Move the transmission rearward into the crossmember and floor pan area; the transmission may rest on the crossmember.

g. Lower the front of the transmission toward the jack.

h. Firmly, grasp the transmission the rear cover while the assistant raises the jack toward the transmission.

i. Carefully, lower the transmission onto the jack and center it.

j. Lower the jack and move the transmission rearward.

24. Remove the engine-to-mount nuts/bolts.

25. Using the hoist, slowly, lift the engine; be sure to hold the front of the engine higher than the rear.

26. Place the engine on a work stand.

To install:

27. Using the hoist, slowly, lower the engine into the vehicle; be sure to hold the front of the engine higher than the rear.

28. Install the engine-to-mount nuts/bolts.

29. If equipped with an automatic transmission, perform the following procedures:

NOTE: Installation of the transmission will require an assistant.

a. Raise the transmission into position.

b. Raise the rear of the transmission and move it into position on the crossmember.

c. Move the transmission forward and engage it with the engine.

d. Install the engine-to-transmission bolts.

e. Install the mount and the rear mount-to-crossmember nuts/bolts.

f. Install the rear mount-to-transmission nuts.

g. Install the torque converter-to-flex plate bolts through the starter hole.

30. If equipped with a manual transmission, perform the following procedures:

NOTE: Installation of the transmission may require an assistant.

a. Raise the transmission into position.

b. Raise the rear of the transmission and move it into position on the crossmember.

c. Move the transmission forward

and engage it with the engine.

d. Install the engine-to-transmission bolts.

e. Install the mount and the rear mount-to-crossmember nuts/bolts.

f. Install the rear mount-to-transmission nuts.

31. Remove the engine hoist and the engine hanger from the rear of the exhaust manifold.

32. Install the front exhaust pipe, exhaust pipe-to-exhaust manifold nuts, the exhaust pipe bracket-to-transmission bolts, the front exhaust pipe-to-2nd exhaust pipe bolts.

33. Install the starter and the starter-to-engine bolts.

34. If equipped with a 2-piece driveshaft, perform the following procedures:

a. Install the front driveshaft into the transmission and the center bearing-to-chassis bolts.

b. Install the rear driveshaft and the rear driveshaft flange-to-front driveshaft flange bolts.

c. Install the rear driveshaft flange-to-pinion nuts.

35. If equipped with a 1-piece driveshaft, install the driveshaft into the transmission and the driveshaft flange-to-pinion nuts.

36. If equipped with an automatic transmission, perform the following procedures:

a. Connect the fluid coolant lines to the transmission.

b. Connect the downshift cable to the transmission.

c. Connect the shift select control link rod to the select lever.

d. Install the oil level gauge and the tube.

37. Install the front wheels and lower the vehicle.

38. Install the gear shift lever by performing the following procedures:

a. Install the shift lever and the shift lever cover bolts.

b. Push the grommet and shift lever boot downward.

c. Install the front console to the floor panel.

39. If equipped with air conditioning, install the compressor to the engine.

40. Install the radiator, the fan blade assembly and the fan shroud.

41. Connect the upper and lower radiator hoses and the reservoir tank hose.

42. Install the radiator grille to the deflector panel.

43. Install the clutch return spring (if equipped), the clutch control cable (if equipped), the back-up light switch connector and the speedometer cable to the transmission.

44. Connect the following items:

a. Air switch valve hose.

b. Oxygen sensor wire.

c. Vacuum switch valve hose.

d. Thermal vacuum switching valve hose.

e. Pressure regulator vacuum hose.

f. Canister hose.

g. ECM harness.

h. Fuel hose(s).

45. Connect the necessary hoses, electrical connectors, control cables and control rods to the engine.

46. Install the air cleaner (2.3L) or air cleaner duct and hose (2.6L).

47. Refill the engine, the transmission and the cooling system. Install the undercover, if equipped.

48. Install the hood.

49. Install the battery and connect both battery cables, the positive cable first.

50. Adjust the belt tension. Start the engine, check for leaks.

51. Check and/or adjust the idle speed and ignition timing.

4wd Vehicles

1986-87

1. Disconnect both battery cables, the negative cable first.

2. Matchmark the hood-to-hinges and remove the hood.

3. Remove the undercover. Open the drain plugs on the radiator and the cylinder and drain the cooling system.

4. Remove the air cleaner by performing the following procedures:

a. Disconnect the air duct and PCV hose from the air cleaner.

b. Disconnect the air hose from the AIR pump.

c. Remove the air cleaner-to-bracket bolts and wing nut.

d. Lift the air cleaner, disconnect the vacuum hose(s) from the underside and remove the air cleaner.

e. Using a clean shop cloth, cover the air cleaner port to prevent dirt from entering the engine.

5. Disconnect the TCA hot air hose and remove the manifold cover.

6. Label and disconnect the electrical connector(s) from the alternator.

7. Remove the exhaust pipe-to-exhaust manifold nuts and separate the pipe from the manifold.

8. Loosen the clutch cable adjusting nut and relieve the tension, if equipped with a manual transmission.

9. Disconnect the heater hoses from the heater core.

10. If equipped with an oxygen sensor, disconnect the electrical connector.

11. If equipped with a vacuum switching valve, disconnect the rubber hose from the valve.

12. Disconnect the engine-to-chassis ground cable.

13. Disconnect the fuel hoses from the carburetor.

14. Disconnect the high-tension wire from the ignition coil, the vacuum hose from the rear connector of the intake manifold and the rubber hoses from the canister.

15. Disconnect the accelerator cable from the carburetor. Disconnect the electrical connectors from the starter, the thermo-unit, the oil pressure switch and distributor harness.

16. Disconnect the hose from the vacuum switch, if equipped, and the solenoid valve.

17. Disconnect the electrical connectors from the EFE heater, the carburetor solenoid valve and the electric choke.

18. From the rear of the engine, disconnect the back-up light switch and transmission wiring at the connector.

19. Using an engine hoist, connect it to the engine hangers and support the engine.

20. Remove the engine-to-mount nut. Raise the engine slightly and remove the left side engine mount stopper plate.

21. If equipped with air conditioning, remove the compressor from the engine and move it aside; do not disconnect the pressure hoses.

22. Disconnect the upper and lower radiator hoses and the reservoir tank hose.

23. Remove the radiator and fan blade assembly.

24. Raise and support the vehicle safely. Drain the oil from the engine.

25. Remove the starter motor and the flywheel cover pan.

26. Remove the bell housing-to-engine bolts and support the transmission.

27. Lift the engine slightly. Remove the exhaust pipe bracket from the transmission and the engine-to-mount nuts.

NOTE: Make certain that all lines, hoses, cables and wires have been disconnected from the engine and frame.

28. Lift the engine from the vehicle with the front of the engine raised slightly to clear the transmission input shaft.

To install:

29. Lower the engine into the vehicle, align it transmission assembly and install the nuts/bolts.

30. Install the starter motor and the flywheel cover pan.

31. If equipped with a manual transmission, install the clutch cable and clutch return spring.

32. Lower the vehicle. Install the fan blade assembly and the radiator.

33. Connect the upper and lower radiator hoses and the reservoir tank hose.

34. If equipped with air conditioning, install the compressor to the engine.

35. Install the left side engine mount stopper plate, lower the engine slightly and install the engine-to-mount nut.

36. Remove the engine hoist.

37. Connect the electrical connector to the back-up light switch and transmission wiring connector at the rear of the engine.

38. Connect the electrical connectors to the EFE heater, the carburetor solenoid valve and the electric choke.

39. Connect the hose to the vacuum switch, if equipped, and the solenoid valve.

40. Connect the accelerator cable to the carburetor. Connect the electrical connectors to the starter, the thermo-unit, the oil pressure switch and distributor harness.

41. Connect the high-tension wire to the ignition coil, the vacuum hose to the rear connector of the intake manifold and the rubber hoses to the canister.

42. Connect the fuel hoses to the carburetor.

43. Connect the engine-to-chassis ground cable.

44. If equipped with a vacuum switching valve, connect the rubber hose to the valve.

45. If equipped with an oxygen sensor, connect the electrical connector.

46. Connect the heater hoses to the heater core.

47. Tension the clutch cable and tighten the adjusting nut, if equipped with a manual transmission.

48. Install the exhaust pipe-to-exhaust manifold nuts.

49. Connect the electrical connector(s) to the alternator.

50. Install the manifold cover and connect the TCA hot air hose.

51. Install the air cleaner by performing the following procedures:

a. Lower the air cleaner and connect the vacuum hose(s) to the underside.

b. Install the air cleaner-to-bracket bolts and wing nut.

c. Connect the air hose to the AIR pump.

d. Connect the air duct and PCV hose to the air cleaner.

52. Refill the cooling system with the proper coolant and the crankcase with engine oil. Check and adjust the clutch pedal freeplay, if equipped with a manual transmission.

53. Install the hood and connect both battery cables, the positive cable first.

54. Adjust the belt tension. Start the engine, check for leaks.

55. Check and/or adjust the idle speed and ignition timing.

nect both battery cables, the negative cable first. Remove the battery.

2. Matchmark the hood-to-hinges and remove the hood.

3. Remove the undercover, if equipped. Open the drain plugs on the radiator and the cylinder and drain the cooling system.

4. Remove the air cleaner (2.3L engine) or air cleaner duct and hose (2.6L engine). Using a clean shop cloth, cover the air cleaner port to prevent dirt from entering the engine.*

5. Label and disconnect the necessary hoses, electrical connectors, control cables and control rods from the engine.

6. Label and disconnect the following items:

a. Air switch valve hose.

b. Oxygen sensor wire.

c. Vacuum switch valve hose.

d. Thermal vacuum switching valve hose.

e. Pressure regulator vacuum hose.

f. Canister hose.

g. ECM harness.

h. Fuel hose(s).

7. Remove the clutch return spring (if equipped), the clutch control cable (if equipped), the back-up light switch connector and the speedometer cable from the transmission.

8. Remove the radiator grille from the deflector panel.

9. Disconnect the upper and lower radiator hoses and the reservoir tank hose.

10. Remove the fan shroud, fan blade assembly and the radiator.

11. If equipped with air conditioning, remove the compressor from the engine and move it aside; do not disconnect the pressure hoses.

12. If equipped with a 2.8L engine, perform the following procedures:

a. Remove the power steering pump-to-engine brackets and move the pump aside.

b. Remove the spark plug wire from the No. 1 spark plug.

c. Remove the distributor cap with the No. 1 spark plug wire.

d. Remove the ignition coil.

13. Remove the gear shift lever by performing the following procedures:

a. Place the gear shift lever in N.

b. Remove the front console from the floor panel.

c. Pull the shift lever boot and grommet upward.

d. Remove the shift lever cover bolts and the shift lever.

14. Remove the transfer shift lever by performing the following procedures:

a. Place the transfer shift lever in H (except 2.8L engine) or 2H (2.8L engine).

b. Pull the shift lever boot and dust cover upward.

c. Remove the shift lever retaining bolts.

d. Pull the shift lever from the transfer case.

15. Raise and safely support the vehicle. Remove the front wheels. Drain the oil from the engine.

16. Drain the transmission and transfer case fluid.

17. If equipped with an automatic transmission, perform the following procedures:

a. Remove the oil level gauge and the tube.

b. Disconnect the shift select control link rod from the select lever.

c. Disconnect the downshift cable from the transmission.

d. Disconnect and plug the fluid coolant lines from the transmission.

18. If equipped with a 1-piece driveshaft, remove the driveshaft flange-to-pinion nuts, lower the driveshaft and pull it from the transmission.

19. If equipped with a 2-piece driveshaft, perform the following procedures:

a. Remove the rear driveshaft flange-to-pinion nuts.

b. Remove the rear driveshaft flange-to-front driveshaft flange bolts and the rear driveshaft.

c. Remove the center bearing-to-chassis bolts, move the front driveshaft rearward and from the transmission.

20. Remove the front driveshaft's splined yoke flange-to-transfer case bolts and separate the front driveshaft from the transfer case; do not allow the splined flange to fall away from the driveshaft.

21. Remove the starter-to-engine bolts and the starter.

22. If equipped with a clutch slave cylinder, remove it from the transmission and move it aside.

23. Remove the exhaust pipe-to-exhaust manifold nuts, the exhaust pipe bracket-to-transmission bolts, the front exhaust pipe-to-2nd exhaust pipe bolts and the front exhaust pipe from the vehicle.

24. Attach an engine hanger to the rear of the exhaust manifold.

25. Using an engine hoist, connect it to the engine hangers and support the engine.

26. If equipped with a 2.8L engine, remove the catalytic converter and the parking brake cable bracket.

27. Remove the transmission/transfer case assembly by performing the following procedures:

a. Using a transmission jack, place it under the transmission and support the assembly.

b. Remove the rear mount-to-transmission nuts.

- c. Remove the rear mount-to-side mount member nuts/bolts and the mount.
- d. Remove the transmission-to-engine bolts.
- e. Move the transmission assembly rearward.
- f. Carefully lower the transmission.
- 28. Remove the engine-to-mount nuts/bolts.
- 29. Using the hoist, slowly, lift the engine; be sure to hold the front of the engine higher than the rear.
- 30. Place the engine on a work stand.
- To install:**
- 31. Using the hoist, slowly, lower the engine into the vehicle; be sure to hold the front of the engine higher than the rear.
- 32. Install the engine-to-mount nuts/bolts.
- 33. Install the transmission/transfer assembly by performing the following procedures:
 - a. Raise the transmission into position.
 - b. Move the transmission forward and engage it with the engine.
 - c. Install the engine-to-transmission bolts.
 - d. Install the rear mount and the rear mount-to-side mount member nuts/bolts.
 - e. Install the rear mount-to-transmission nuts.
 - f. Remove the transmission jack.
- 34. If equipped with a 2.8L engine, install the catalytic converter and the parking brake cable bracket.
- 35. Remove the engine hoist and the engine hanger from the rear of the exhaust manifold.
- 36. Install the front exhaust pipe, exhaust pipe-to-exhaust manifold nuts, the exhaust pipe bracket-to-transmission bolts, the front exhaust pipe-to-2nd exhaust pipe bolts.
- 37. If equipped with a clutch slave cylinder, install it onto the transmission.
- 38. Install the starter and the starter-to-engine bolts.
- 39. Install the front driveshaft's splined yoke flange-to-transfer case bolts.
- 40. If equipped with a 2-piece driveshaft, perform the following procedures:
 - a. Install the front driveshaft into the transmission and the center bearing-to-chassis bolts.
 - b. Install the rear driveshaft and the rear driveshaft flange-to-front driveshaft flange bolts.
 - c. Install the rear driveshaft flange-to-pinion nuts.
- 41. If equipped with a 1-piece driveshaft, install the driveshaft into the transmission and the driveshaft flange-to-pinion nuts.

- 42. If equipped with an automatic transmission, perform the following procedures:
 - a. Connect the fluid coolant lines to the transmission.
 - b. Connect the downshift cable to the transmission.
 - c. Connect the shift select control link rod to the select lever.
 - d. Install the oil level gauge and the tube.
- 43. Install the front wheels and lower the vehicle.
- 44. Install the transfer shift lever by performing the following procedures:
 - a. Position the shift lever into the transfer case.
 - b. Install the shift lever retaining bolts.
 - c. Push the dust cover and the shift lever boot downward.
- 45. Install the gear shift lever by performing the following procedures:
 - a. Install the shift lever and the shift lever cover bolts.
 - b. Push the grommet and shift lever boot downward.
 - c. Install the front console to the floor panel.
- 46. If equipped with a 2.8L engine, perform the following procedures:
 - a. Install the ignition coil.
 - b. Install the distributor cap with the No. 1 spark plug wire.
 - c. Install the spark plug wire from the No. 1 spark plug and reconnect the wires to the distributor cap.
 - d. Install the power steering pump-to-engine brackets.
- 47. If equipped with air conditioning, install the compressor to the engine.
- 48. Install the radiator, the fan blade assembly and the fan shroud.
- 49. Connect the upper and lower radiator hoses and the reservoir tank hose.
- 50. Install the radiator grille to the deflector panel.
- 51. Install the clutch return spring (if equipped), the clutch control cable (if equipped), the back-up light switch connector and the speedometer cable to the transmission.
- 52. Connect the following items:
 - a. Air switch valve hose.
 - b. Oxygen sensor wire.
 - c. Vacuum switch valve hose.
 - d. Thermal vacuum switching valve hose.
 - e. Pressure regulator vacuum hose.
 - f. Canister hose.
 - g. ECM harness.
 - h. Fuel hose(s).
- 53. Connect the necessary hoses, electrical connectors, control cables and control rods to the engine.
- 54. Install the air cleaner (2.3L engine) or air cleaner duct and hose (2.6L

engine).

55. Refill the engine, the transmission, the transfer case and the cooling system. Install the undercover, if equipped.

56. Install the hood.

57. Install the battery and connect both battery cables, the positive cable first.

58. Adjust the belt tension. Start the engine, check for leaks.

59. Check and/or adjust the idle speed and ignition timing.

Cylinder Head

REMOVAL & INSTALLATION

2.0L Engine

- 1. Disconnect the negative battery cable. Remove the rocker cover.
- 2. Remove the EGR pipe clamp bolt at the rear of the cylinder head.
- 3. Raise and support the vehicle safely. Disconnect the exhaust pipe at the exhaust manifold.
- 4. Lower the vehicle and drain the cooling system.
- 5. Disconnect the heater hoses at the intake manifold and at the rear of the cylinder head. Remove the air conditioning compressor and/or power steering pump with hoses attached and support them aside.
- 6. Disconnect the accelerator linkage and fuel line at the carburetor. Disconnect and label the electrical connections, spark plug wires and vacuum lines at the cylinder head.
- 7. Rotate the engine until the No. 4 cylinder is in the firing position. Remove the distributor cap and mark the rotor to housing relationship. Remove distributor and the fuel pump.
- 8. Lock the timing chain adjuster by depressing and turning the automatic adjuster side pin 90 degrees clockwise.
- 9. Remove the timing sprocket-to-camshaft bolt and remove the sprocket from the camshaft.

NOTE: Keep the sprocket on the chain damper and chain.

- 10. Disconnect the AIR hose and the check valve at the exhaust manifold.
- 11. Remove the cylinder head to timing cover bolts.
- 12. Starting with the outer bolts and working inward, remove the cylinder head bolts.
- 13. Remove the cylinder head, intake and exhaust manifold as a unit.

To install:

- 14. To install, use a new gasket and install the cylinder head on the engine.
- 15. Torque the bolts to 57 ft. lbs. in the 1st step and to 65-79 ft. lbs. in the final step.
- 16. Install the timing chain by performing the following procedures:

View of the cylinder head bolt torquing sequence—2.0L engine

b. Confirm that the No. 1 piston is at TDC. If not, turn the crankshaft so the key is turned toward the cylinder head side (No. 1 and No. 4 pistons at top dead center).

c. Install the timing chain by aligning the mark plate on the chain with the mark on the crankshaft timing sprocket. The side of the chain with the mark plate is on the front side and the side of the chain with the most links between the mark plates is on the chain guide side.

d. Install the camshaft timing sprocket so the mark side of the sprocket faces forward and so the triangular mark aligns with the chain mark plate.

NOTE: Keep the timing chain engaged with the camshaft timing sprocket until the sprocket is installed on the camshaft.

17. Install the front cover assembly, using a new gasket and sealer.

18. Connect the AIR hose and the check valve at the exhaust manifold.

19. Connect the accelerator linkage and fuel line to the carburetor. Connect the electrical connections, the spark plug wires and the vacuum lines.

20. Connect the heater hoses to the intake manifold and the rear of the cylinder head. Install the air conditioner compressor and/or power steering pump.

21. Connect the exhaust pipe to the exhaust manifold.

22. Install the EGR pipe clamp bolt to the rear of the cylinder head.

23. Install the rocker arm cover and connect the negative battery cable.

24. Start the engine and check for leaks.

2.3L and 2.6L Engines

1. Relieve the fuel pressure. Disconnect the negative battery cable. Drain the cooling system.

2. Remove the drive belts from the power steering pump, the air pump, the air conditioning compressor (if equipped) and the cooling fan.

3. Rotate the engine to position the No. 1 cylinder on TDC.

4. Remove the distributor cap, high tension cables and the distributor.

5. Remove the exhaust manifold-to-exhaust pipe bolts.

6. Label and disconnect the electrical connectors and vacuum hoses which may be in the way.

7. On the 2.3L engine, remove the carburetor.

8. Remove the coolant hoses, the radiator and the cooling fan assembly.

9. Remove the crankshaft pulley bolt and the pulley.

10. Remove the upper and lower timing belt covers, the tension spring and the timing belt.

11. Remove the camshaft pulley bolt, the pulley and the camshaft boss.

12. Remove the timing belt guide plate and the cylinder head front plate.

13. Remove the rocker arm cover and gasket.

14. Remove the cylinder head-to-engine bolts, the cylinder head and gasket.

15. Clean the gasket mounting surfaces.

To install:

16. Using a new gasket, install the cylinder head and torque the bolts, in sequence to 57 ft. lbs. in the 1st step and to 65–79 ft. lbs. in the final step.

17. Install the camshaft pulley.

18. Using a new gasket, install the rocker arm cover.

19. Align the camshaft pulley mark with the mark on the front plate. Make sure the keyway on the crankshaft is facing upward, aimed at the pointer on the engine block.

View of the cylinder head bolt torquing sequence—2.3L and 2.6L engines

20. Install the timing belt in the following order: crankshaft pulley, the oil pump pulley, the camshaft and the tensioner.

21. Install the timing belt covers, using a new gasket.

22. Install the crankshaft pulley.

23. Install the cooling fan assembly, the radiator and the coolant hoses.

24. On the 2.3L engine, install the carburetor.

25. Connect the electrical connectors and vacuum hoses.

26. Install the exhaust manifold-to-exhaust pipe bolts.

27. Install the distributor, the distributor cap, and the high tension cables.

28. Install the drive belts to the power steering pump, the air pump, the air

conditioning compressor (if equipped) and the cooling fan.

29. Disconnect the negative battery cable. Refill the cooling system.

30. Start the engine and check for leaks.

2.8L Engine

LEFT SIDE

1. Relieve the fuel pressure. Disconnect the negative battery cable. Drain the cooling system.

2. Remove the intake manifold.

3. Raise and safely support the vehicle.

4. Disconnect the exhaust pipe from the exhaust manifold and remove the exhaust manifold-to-cylinder head bolts.

5. Remove the dipstick tube from the engine.

6. Lower the vehicle.

7. Loosen the rocker arm nuts, turn the rocker arms and remove the pushrods; keep the pushrods in the same order as removed.

8. Remove the cylinder head bolts in stages and in the reverse order of torquing.

9. Remove the cylinder head; do not pry on the head to loosen it.

10. Clean the gasket mounting surfaces.

To install:

11. Position a new cylinder head gasket over the dowel pins with the words **This Side Up** facing upwards. Carefully, guide the cylinder head into place.

12. Install the pushrods; make sure the lower ends are in the lifter heads. Torque the rocker arm nuts to 14–20 ft. lbs. (20–27 Nm).

13. Install the intake manifold.

14. Install the dipstick tube to the engine.

15. Install the exhaust manifold-to-cylinder head bolts and the exhaust pipe-to-exhaust manifold nuts.

16. Refill the cooling system. Start the engine and check for leaks.

View of the cylinder head bolt torquing sequence—2.8L engine

RIGHT SIDE

1. Relieve the fuel pressure. Disconnect the negative battery cable. Drain the cooling system.

2. Remove the intake manifold.

3. If equipped, remove the cruise

control servo bracket, the air management valve and hose.

4. Raise and safely support the vehicle.

5. Disconnect the exhaust pipe from the exhaust manifold and remove the exhaust manifold-to-cylinder head bolts.

6. Remove the exhaust pipe at crossover, the crossover and the heat shield, if equipped.

7. Lower the vehicle.

8. Label and disconnect the electrical wiring and vacuum hoses that may interfere with the removal of the right cylinder head.

9. Loosen the rocker arm nuts, turn the rocker arms and remove the pushrods; keep the pushrods in the same order as removed.

10. Remove the cylinder head bolts in stages and in the reverse order of torquing.

11. Remove the cylinder head; do not pry on the head to loosen it.

12. Clean the gasket mounting surfaces.

To install:

13. Position a new cylinder head gasket over the dowel pins with the words **This Side Up** facing upwards. Carefully, guide the cylinder head into place.

14. Install the pushrods; make sure the lower ends are in the lifter heads. Torque the rocker arm nuts to 14–20 ft. lbs. (20–27 Nm).

15. Install the intake manifold.

16. Install the exhaust pipe at crossover, the crossover and the heat shield, if equipped.

17. Install the exhaust manifold-to-cylinder head bolts and the exhaust pipe-to-exhaust manifold nuts.

19. Connect the electrical wiring and vacuum hoses to the right cylinder head.

20. If equipped, install the cruise control servo bracket, the air management valve and hose.

21. Refill the cooling system. Start the engine and check for leaks.

1. Remove the rocker arm cover and discard the gasket.

2. Make sure both the cylinder head and camshaft retaining bolts are tightened to the proper torque.

3. Rotate the crankshaft pulley until the No. 1 piston is at TDC of the compression stroke.

NOTE: To make sure the piston is on the correct stroke, remove the spark plug and place a finger over the hole. Feel for air being forced out of the spark plug hole. Both valves on No. 1 cylinder will be closed. Stop turning the crankshaft when the TDC timing mark on the crankshaft pulley is directly aligned with the timing mark pointer.

4. With the No. 1 piston at TDC of the compression stroke, adjust the clearances of the following valves:

Intake: 1 and 2

Exhaust: 1 and 3

5. Adjust the clearance by loosening the locknut and turning the adjusting screw. Retightening the locknut when the proper thickness feeler gauge passes between the camshaft or valve stem and has a slight drag when the clearance is corrected.

6. Rotate the crankshaft 1 complete revolution (360 degrees) to position the No. 4 piston at TDC of its compression stroke and adjust the clearances of the following valves:

Intake: 3 and 4

Exhaust: 2 and 4

7. After adjustment, use a new gasket, sealant and install the rocker arm cover.

Adjusting the valves—2.0L, 2.3L and 2.6L engines

2.8L Engine

1. Remove the valve covers.

2. Rotate the crankshaft until the No. 1 cylinder is on the TDC of its compression stroke.

NOTE: When the notch on the damper pulley is aligned with the 0 timing mark and the rocker arms of the No. 1 cylinder do not move, the engine is at the TDC of the compression stroke of the No. 1 cylinder.

3. With the engine at TDC of the No. 1 cylinder, adjust the following valves:

Exhaust: 1, 2 and 3

Intake: 1, 5 and 6

4. Back out the adjusting nut until lash is felt.

5. Tighten the adjusting nut until the lash is removed, then, turn the nut 1½ additional turns to center the lifter plunger.

6. Rotate the engine 1 complete revolution and reposition the notch on the damper pulley with the 0 mark on the timing tab; this is the No. 4 cylinder firing position.

7. With the engine at TDC of the No. 4 cylinder, adjust the following valves:

Exhaust: 4, 5 and 6

Intake: 2, 3 and 4

8. Back out the adjusting nut until lash is felt.

9. Tighten the adjusting nut until the lash is removed, plus, turn the nut 1½ additional turns to center the lifter plunger.

10. Using a new gasket and sealant, install the rocker arm covers.

Rocker Arms/Shafts

REMOVAL & INSTALLATION

2.0L, 2.3L and 2.6L Engines

1. Disconnect the negative battery cable. Remove the rocker cover.

2. Loosen the rocker arm shaft bracket nuts a little at a time, in sequence, starting with the outer nuts.

3. Remove the nuts from the rocker arm shaft brackets. Remove shaft assembly.

4. To disassemble the rockers and shafts; remove the spring from the rocker arm shaft, the rocker brackets and arms. Keep parts in order for reassembly.

5. Before installing apply a generous amount of clean engine oil to the rocker arm shaft, rocker arms and valve stems.

To install:

6. Install the longer shaft on the exhaust valve side and the shorter shaft on the intake side so the aligning marks on the shafts are turned on the front side of the engine.

7. Assemble the rocker arm shaft brackets and rocker arms to the shafts so the cylinder number, on the upper face of the brackets, points toward the front of the engine.

8. Align the mark on the No. 1 rocker arm shaft bracket with the mark on the intake and exhaust valve side rocker arm shaft.

9. Make certain the amount of projection of the rocker arm shaft beyond

Valve Lash

ADJUSTMENT

2.0L, 2.3L and 2.6L Engines

NOTE: The valves are adjusted with the engine COLD. It is best to allow an engine to sit overnight before beginning a valve adjustment. While all valve adjustments must be made as accurately as possible, it is better to have the valve adjustment slightly loose rather than slightly tight. A burned valve may result from overly tight valve adjustments.

Adjusting the valves—2.8L engine

1. Bracket
2. Rocker arm shaft
3. Rocker arm
4. Rocker arm spring
5. Rocker arm bracket nut

Exploded view of the rocker arm/shaft assembly—2.0L, 2.3L and 2.6L engines

View of the rocker arm/shaft assembly torquing sequence—2.0L, 2.3L and 2.6L engines

the face of the No. 1 rocker arm shaft bracket, is longer on the exhaust side shaft than on the intake shaft when the rocker arm shaft stud holes are aligned with the rocker arm shaft bracket stud holes.

10. Place the rocker arm shaft springs in position between the shaft bracket and rocker arm.

11. Check that the punch mark on the rocker arm shaft is facing upward, then, install the rocker arm shaft bracket assembly onto the cylinder head studs. Align the mark on the camshaft with the mark on the No. 1 rocker arm shaft bracket.

12. Torque the rocker arm shaft brackets-to-cylinder head nuts to 16 ft. lbs. and bolts to 6 ft. lbs.

NOTE: Hold the rocker arm springs while torquing the nuts to prevent damage to the spring. Start with the center nut and work outward.

13. Adjust the valves and install the camshaft cover, with a new gasket and sealer. Check the ignition timing.

2.8L Engine

1. Disconnect the negative battery cable.

2. Remove the rocker arm covers.

3. Remove the rocker arm nut, the pivot balls, the rocker arm and the pushrods. Keep all components separated so they may be reinstalled in the same location.

Exploded view of the cylinder head/rocker arm assembly—2.8L engine

NOTE: The intake and exhaust pushrods are of different lengths.

To install:

4. Install the pushrods in their original location; be sure the lower ends are seated in the lifter.

5. Coat the bearing surfaces of the rocker arms and pivot balls with Molykote or equivalent.

6. Install the rocker arm nuts and torque them to 14–20 ft. lbs. (20–27 Nm).

7. Adjust the valve lash.

Intake Manifold

REMOVAL & INSTALLATION

2.0L and 2.3L Engines

1. Relieve the fuel pressure. Disconnect the negative battery cable and remove the air cleaner assembly.

2. Remove the EGR pipe clamp bolt at the rear of the cylinder head.

3. Raise and support the vehicle safely. Remove the EGR pipe from the intake and exhaust manifolds.

4. Remove the EGR valve and bracket assembly from the intake manifold.

5. Lower the vehicle and drain the cooling system.

6. Remove the upper coolant hoses from the manifold.

7. Disconnect the accelerator linkage, vacuum lines, electrical wiring and fuel line from the intake manifold.

8. Remove the intake manifold mounting nuts and remove the manifold from the cylinder head.

9. Remove the lower heater hose while holding the manifold away from the engine. Remove the manifold from the vehicle.

To install:

10. Connect the lower heater hose to the manifold. Using a new gasket, install the intake manifold.

11. Connect the accelerator linkage, vacuum lines, electrical wiring and fuel line to the intake manifold.

12. Connect the upper coolant hose to the intake manifold.

13. Install the EGR valve and bracket assembly to the intake manifold.

14. Install the EGR pipe to the intake and exhaust manifolds. Lower the vehicle.

15. Install the EGR pipe clamp bolt to the rear of the cylinder head.

16. Install the air cleaner and connect the negative battery cable.

2.6L Engine

1. Relieve the fuel pressure. Disconnect the negative battery cable and remove the air duct.

2. Drain the cooling system. Remove the upper coolant hoses from the manifold.

Exploded view of the Intake manifold—2.0L and 2.3L engines

3. Remove the air regulator rubber hose from the intake plenum.

4. Remove the EGR valve and bracket assembly from the intake manifold.

5. Disconnect the accelerator linkage, vacuum lines, electrical wiring and fuel line from the throttle body.

6. Remove the throttle body-to-plenum nuts and the throttle body.

7. Remove the plenum-to-intake manifold bolts and the plenum.

8. Remove the intake manifold-to-cylinder head nuts and the manifold from the cylinder head.

To install:

9. Using a new gasket, install the intake manifold to the cylinder head.

10. Using a new gasket, install the plenum to the intake manifold.

11. Using a new gasket, install the throttle body to the plenum.

12. Connect the accelerator linkage, vacuum lines, electrical wiring and fuel line.

13. Install the EGR valve and bracket assembly to the intake manifold.

14. Install the air regulator rubber hose to the intake plenum.

15. Install the upper coolant hoses to the manifold.

16. Install the air duct. Connect the negative battery cable. Refill the cooling system.

2.8L Engine

1. Relieve the fuel pressure. Disconnect the negative battery cable.

2. Remove the air cleaner. Drain the cooling system.

3. Label and disconnect the wires and hoses from the TBI unit and the intake manifold.

4. Disconnect and plug the fuel lines from the TBI unit.

5. Disconnect the accelerator cables from the TBI unit.

6. Disconnect the ignition wires from the spark plugs and the wires from the coil.

7. Remove the distributor cap with the wires.

9. Cylinder head assembly

Exploded view of the Intake manifold assembly—2.8L engine

8. Mark the location of the rotor to the distributor housing and the distributor housing to the intake manifold.

9. Remove the distributor hold-down clamp and the distributor.

10. Label and disconnect the EGR vacuum line and the emission hoses.

11. Remove the pipe brackets from the rocker arm covers.

12. Remove the rocker arm covers.

13. Remove the upper radiator hose and the heater hose.

14. Disconnect the electrical connectors from the coolant sensors.

15. Remove the intake manifold nuts/bolts, the manifold and gaskets.

16. Clean the gasket mounting surfaces.

To install:

17. Using RTV sealant, apply an 1/8

Exploded view of the Intake manifold assembly—2.6L engine

in. bead to the front and rear of the block; make sure no water or oil is present.

18. Using new gaskets, marked right and left side, apply a ¼ in. bead of sealant to hold them in place and install them onto the cylinder heads; the gaskets may have to be cut to be installed around the pushrods.

19. Install the intake manifold and torque the nuts/bolts, in sequence, to 23 ft. lbs. (31 Nm) and retorquer using the same sequence.

NOTE: Make sure the areas between the case ridges and the intake manifold are completely sealed.

20. Install the heater hose and the radiator to the manifold.

21. Using new gaskets, install the rocker arm covers.

22. Connect the electrical connectors to the coolant sensors.

23. Install the pipe brackets.

24. Align the matchmarks and install the distributor and the distributor cap.

25. Connect the fuel lines and the accelerator cables to the TBI unit.

26. Connect all the wires and vacuum hoses.

27. Install the air cleaner. Connect the negative battery cable. Refill the cooling system.

Exhaust Manifold

REMOVAL & INSTALLATION

2.0L and 2.3L Engines

1. Disconnect the negative battery

cable and remove the air cleaner assembly.

2. Remove the EGR pipe clamp bolt at the rear of the cylinder head.

3. Raise and safely support the vehicle. Remove the EGR pipe from the intake and exhaust manifolds.

4. Disconnect the exhaust pipe from the exhaust manifold. Disconnect the electrical connector from the oxygen sensor.

5. Remove the manifold shield and heat stove.

6. Remove the manifold retaining nuts and remove the manifold from the engine.

To install:

7. Using a new gasket, install the exhaust manifold and torque the nuts

to 14-18 ft. lbs.

8. Install the heat stove and shield.
9. Connect the exhaust pipe to the exhaust manifold. Connect the electrical connector to the oxygen sensor.
10. Install the EGR pipe to the intake and exhaust manifolds and lower the vehicle.
11. Install the EGR pipe clamp bolt to the rear of the cylinder head.
12. Install the air cleaner. Connect the negative battery cable.

2.6L Engine

1. Disconnect the negative battery cable and remove the air duct.
2. Remove the hoses from the air pump.
3. Remove the air pump bolts, remove the drive belt and the air pump.
4. Remove the EGR pipe clamp bolt at the rear of the cylinder head.
5. Raise and safely support the vehicle. Remove the EGR pipe from the intake and exhaust manifolds. If necessary, remove the dipstick and tube.
6. Disconnect the exhaust pipe from the exhaust manifold. Disconnect the electrical connector from the oxygen sensor.
7. Remove the manifold shield.
8. Remove the manifold-to-cylinder head nuts and the manifold from the engine.

To install:

9. Using a new gasket, install the exhaust manifold and torque the nuts to 16 ft. lbs.
10. Install the heat shield. If the dipstick was removed, install the tube and the dipstick.
11. Connect the exhaust pipe to the exhaust manifold. Connect the electrical connector to the oxygen sensor.
12. Install the EGR pipe to the intake and exhaust manifolds and lower the vehicle.

Exploded view of the exhaust manifold—2.6L engine

13. Install the EGR pipe clamp bolt to the rear of the cylinder head.
14. Install the air duct. Connect the negative battery cable.

2.8L Engine

1. Disconnect the negative battery cable.
2. Raise and safely support the vehicle.
3. Remove the exhaust pipe from the manifold.
4. Lower the vehicle and remove the rear manifold bolts.
5. On the right side, remove the diverter valve, the heat shield, the AIR pump bracket and alternator bracket.
6. On the left side, remove the heat stove tube and the power steering bracket.
7. Remove the exhaust manifold-to-cylinder head bolts and the manifold.
8. Clean the gasket mounting surfaces.

To install:

9. Using a new gasket, install the exhaust manifold-to-cylinder head bolts and torque the bolts to 25 ft. lbs. (34 Nm).
10. On the left side, install the power steering bracket and heat stove tube.

11. On the right side, install the AIR pump bracket, the alternator bracket, the diverter valve and the heat shield.
12. Raise and safely support the vehicle.
13. Install the exhaust pipe-to-manifold bolts.
14. Lower the vehicle and connect the negative battery cable.

Timing Chain Front Cover

REMOVAL & INSTALLATION

2.0L Engine

1. Disconnect the negative battery cable.
2. Drain the cooling system.
3. Disconnect the radiator hoses and remove the radiator.
4. Remove the air cleaner and the rocker arm cover.
5. Remove the alternator and air conditioning compressor drive belts.
6. Remove the cooling fan.
7. Raise and safely support the vehicle. Drain the engine.
8. Remove the crankshaft pulley center bolt, the pulley and balancer assembly.
9. Remove the oil pan-to-engine bolts and the oil pan.
10. Remove the oil pump pick-up tube, the oil pump-to-front cover bolts and the oil pump.
11. Remove the front cover-to-engine bolts and the front cover from the engine and discard the gasket.
12. Clean the gasket mounting surfaces.

NOTE: When the front cover is removed, replace the oil seal.

To install:

13. Using a new gasket and sealant, install the front cover to the engine and torque the bolts to 18 ft. lbs.
14. Align the oil pump's slotted shaft with the tip of the distributor and install the oil pump. Install the oil pick-up tube to the oil pump.
15. Using a new gasket, install the oil pan.
16. Install the crankshaft balancer assembly, pulley and bolt. Lower the vehicle.
17. Install the cooling fan assembly.
18. Install the alternator and compressor drive belts and adjust the tension.
19. Using a new gasket, install the rocker arm cover. Install the air cleaner.
20. Refill the crankcase and the cooling system.
21. Connect the negative battery cable.

Exploded view of the exhaust manifold—2.0L and 2.3L engines

Exploded view of the exhaust manifolds—2.8L engine

Exploded view of the front cover assembly—2.0L engine

2.8L Engine

1. Disconnect the negative battery cable.
2. Drain the cooling system. Remove the lower radiator hose from the front cover.
3. Remove the water pump.
4. Remove the power steering pump bracket, if equipped.
5. Remove the crankshaft pulley.
6. Remove the front cover-to-engine bolts and the cover and discard the gasket.
7. Clean the gasket mounting surfaces.

NOTE: When the front cover is removed, replace the oil seal.

To install:

8. Using a new gasket and sealant, install the front cover.
9. Install the water pump and the lower radiator hose.

10. Install the crankshaft pulley.
11. Install the power steering pump bracket, if equipped.
12. Install the drive belt(s).
13. Connect the negative battery cable and refill the cooling system.

Front Cover Oil Seal**REPLACEMENT****2.0L Engine**

1. Disconnect the negative battery cable.
2. Drain the cooling system.
3. Disconnect the radiator hoses and remove the radiator.
4. Remove the alternator and compressor drive belts.
5. Remove the cooling fan.
6. Remove the crankshaft pulley center bolt, the pulley and balancer assembly.

7. Using a small pry bar and care not to damage the crankshaft and cover sealing surfaces, carefully, pry out the timing cover seal.

To install:

8. Using engine oil, lubricate the new seal and tap it into the front cover.
9. Install the balancer assembly, the pulley and the center bolt.
10. Install the cooling fan and the drive belts.
11. Install the radiator and connect the hoses.
12. Refill the cooling system and connect the negative battery cable.

2.8L Engine

1. Disconnect the negative battery cable.
2. Remove the crankshaft pulley.
3. Using a small pry bar, pry the oil seal from the front cover; be careful not to damage the sealing surface or the crankshaft.
4. Using an oil seal installation tool, lubricate the new seal with engine oil and drive it into the front cover; be careful not to cut the seal lip.
5. Install the crankshaft pulley.
6. Connect the negative battery cable.

Timing Chain and Sprockets**REMOVAL & INSTALLATION****2.0L Engine**

1. Disconnect the negative battery cable. Rotate the engine until No. 1 piston is at TDC on the compression stroke.
2. Remove the rocker arm cover, the front cover and the oil pan.
3. Depress or lock the shoe of the

automatic chain adjuster in the retracted position.

4. Remove the camshaft sprocket-to-camshaft bolts and the sprocket.

5. Remove the timing chain from the timing sprockets.

6. Using a puller, remove the sprocket and the pinion gear from the crankshaft.

7. Remove the bolt or E-clip and remove the automatic chain adjuster.

8. Inspect the adjuster pin, arm, wedge and rack teeth. Replace assembly if worn. Remove the chain tensioner.

9. Check the timing chain for wear.

10. Check the tensioner pins for wear or damage and replace if necessary.

11. Replace the chain tensioner and adjuster using the E-clips or bolt.

To install:

12. Install the timing sprocket and pinion gear with the groove side toward the front cover. Align the key grooves with the key on the crankshaft, then, drive into position.

13. Confirm the No. 1 piston is at TDC; if not, turn the crankshaft so the key is turned toward the cylinder head side (No. 1 and No. 4 pistons at top dead center).

14. Install the timing chain by aligning the mark plate on the chain with the mark on the crankshaft timing sprocket. The side of the chain with the mark plate is on the front side and the side of the chain with the most links between the mark plates is on the chain guide side.

15. Install the camshaft timing sprocket so the mark side of the sprocket faces forward and so the triangular mark aligns with the chain mark plate.

NOTE: Keep the timing chain engaged with the camshaft timing sprocket until the sprocket is installed on the camshaft.

16. Using a new gasket and sealant, install the front cover assembly.

17. Install the rocker arm cover and oil pan.

18. Refill the cooling system and the crankcase.

19. Connect the negative battery cable.

2.8L Engine

1. Disconnect the negative battery cable.

2. Rotate the crankshaft to position the No. 1 cylinder at the TDC of its compression stroke.

3. Remove the front cover.

4. Inspect the sprocket for chipped teeth and wear.

5. Inspect the timing chain for wear; if the chain can be pulled out

1. Timing chain alignment mark
2. Crankshaft alignment mark

Aligning the timing chain the crankshaft sprocket—2.0L engine

ALIGNMENT MARKS

Aligning the timing chain with the camshaft sprocket—2.0L engine

View of the timing chain adjuster—2.0L engine

- B. No. 4 cylinder at TDC
30. Bolt

View of the timing chain alignment marks—2.8L engine

more than 0.374 in. (9.5mm) from the damper, replace the chain.

6. Remove camshaft sprocket-to-camshaft bolts, the sprocket and the timing chain; if necessary, use a mallet to tap the sprocket from the camshaft.

7. Using a puller tool, press the crankshaft sprocket from the crankshaft.

To install:

8. Using an installation tool and a

hammer, drive the crankshaft sprocket onto the crankshaft; make sure the timing mark faces outward.

9. Using Molykote or equivalent, lubricate the camshaft sprocket thrust surface and install the timing chain onto the sprocket.

10. While holding the camshaft sprocket and chain vertically, align the marks on the camshaft and crankshaft sprockets.

11. Align the camshaft dowel with the camshaft sprocket hole. Install the camshaft sprocket and torque the bolts to 17 ft. lbs. (23 Nm).

12. Lubricate the timing chain with engine oil.

13. Install the front cover and crankshaft pulley.

14. Connect the negative battery cable.

15. Start the engine, then, check and/or adjust the timing.

Timing Belt Front Cover

REMOVAL & INSTALLATION

2.3L and 2.6L Engines

1. Disconnect the negative battery cable.

2. Remove all accessory drive belts and the cooling fan assembly.

3. Remove the crankshaft pulley bolt and pulley.

4. Remove the upper timing belt cover.

5. Remove the lower timing belt cover.

6. To install, reverse the removal procedures.

OIL SEAL REPLACEMENT

2.3L and 2.6L Engines

1. Disconnect the negative battery cable. Remove the crankshaft pulley.

2. Remove the upper and lower timing belt covers.

3. Rotate the crankshaft to align the camshaft sprocket with the mark on the rear timing cover and the crankshaft sprocket keyway with the mark on the oil seal retainer cover.

NOTE: With the timing marks aligned, the engine is positioned on the TDC of the No. 4 cylinder's compression stroke.

4. Loosen the timing belt tensioner and relax the tension and remove the timing belt from the crankshaft sprocket.

5. Remove the crankshaft sprocket bolt, the sprocket, the key and deflector shield.

6. Using a small pry bar, pry the oil seal from the oil seal retainer.

To install:

7. Using a new oil seal, lubricate it with engine oil and tap it into the retainer with an oil seal installation tool.

8. Install the deflector, the key, the crankshaft sprocket and bolt.

9. With the crankshaft sprocket aligned with the timing mark, install the timing belt.

10. Apply the tensioner pulley spring pressure to the timing belt.

11. Rotate the crankshaft 2 complete revolutions in the opposite direction of rotation and realign the timing marks.

12. Loosen the tensioner pulley bolt to allow the spring to adjust the correct tension. Torque the tensioner pulley bolt to 14 ft. lbs.

13. Install the timing covers and the crankshaft pulley.

14. To complete the installation, reverse the removal procedures.

Timing Belt and Tensioner

ADJUSTMENT

2.3L and 2.6L Engines

1. Disconnect the negative battery cable. Remove the crankshaft pulley.

2. Remove the upper and lower timing belt covers.

3. Loosen the timing belt tensioner and relax the belt tension.

4. Apply the tensioner pulley spring pressure to the timing belt.

5. Rotate the crankshaft 2 complete revolutions in the opposite direction of rotation and realign the timing marks.

6. Loosen the tensioner pulley bolt to allow the spring to adjust the correct tension. Torque the tensioner pulley bolt to 14 ft. lbs.

7. Install the timing covers and the crankshaft pulley.

8. To complete the installation, reverse the removal procedures.

View of the crankshaft sprocket alignment mark—2.3L and 2.6L engines

REMOVAL & INSTALLATION

2.3L and 2.6L Engines

1. Disconnect the negative battery cable. Remove the crankshaft pulley.

2. Remove the upper and lower timing belt covers.

3. Rotate the crankshaft to align the camshaft sprocket with the mark on the rear timing cover and the crankshaft sprocket keyway with the mark on the oil seal retainer cover.

1. Crankshaft pulley bolt
2. Timing belt cover

9. Water pump
10. Rear timing belt covers

Exploded view of the timing belt assembly—2.3L and 2.6L engines

View of the camshaft sprocket alignment mark—2.3L and 2.6L engines

NOTE: With the timing marks aligned, the engine is positioned on the TDC of the No. 4 cylinder's compression stroke.

4. Loosen the timing belt tensioner and relax the tension and remove the timing belt from the crankshaft sprocket.

To install:

5. With the crankshaft and the camshaft sprockets aligned with the timing marks, install the timing belt. Install the timing belt using the following sequence: the crankshaft sprocket, the oil pump sprocket and the camshaft sprocket.

6. Apply the tensioner pulley spring pressure to the timing belt.

7. Rotate the crankshaft 2 complete revolutions in the opposite direction of rotation and realign the timing marks.

8. Loosen the tensioner pulley bolt to allow the spring to adjust the correct tension. Torque the tensioner pulley bolt to 14 ft. lbs.

9. Install the timing covers and the crankshaft pulley.

10. To complete the installation, reverse the removal procedures.

Timing Sprockets

REMOVAL & INSTALLATION

2.3L and 2.6L Engines

CAMSHAFT SPROCKET

1. Disconnect the negative battery cable.

2. Remove the timing belt.

3. Remove the camshaft sprocket-to-camshaft bolt and the sprocket.

NOTE: It may be necessary to use a mallet to tap the sprocket from the camshaft.

4. Remove and replace the camshaft oil seal.

To install:

5. Align the camshaft sprocket-to-rear plate timing marks. With the crankshaft sprocket aligned with the timing mark, install the timing belt.

6. Apply the tensioner pulley spring pressure to the timing belt.

7. Rotate the crankshaft 2 complete revolutions in the opposite direction of rotation and realign the timing marks.

8. Loosen the tensioner pulley bolt to allow the spring to adjust the correct tension. Torque the tensioner pulley bolt to 14 ft. lbs.

9. Install the timing covers and the crankshaft pulley.

10. To complete the installation, reverse the removal procedures.

CRANKSHAFT SPROCKET

1. Disconnect the negative battery cable.

2. Remove the timing belt.

3. Remove the crankshaft sprocket-to-crankshaft bolt. Using a puller, press the sprocket from the crankshaft.

4. Remove and replace the crankshaft oil seal.

To install:

5. Align the crankshaft sprocket-to-oil seal retainer plate timing marks.

6. With the camshaft sprocket aligned with its timing mark, install the timing belt.

7. Apply the tensioner pulley spring pressure to the timing belt.

8. Rotate the crankshaft 2 complete revolutions in the opposite direction of rotation and realign the timing marks.

9. Loosen the tensioner pulley bolt to allow the spring to adjust the correct tension. Torque the tensioner pulley bolt to 14 ft. lbs.

10. Install the timing covers and the crankshaft pulley.

11. To complete the installation, reverse the removal procedures.

Camshaft

REMOVAL & INSTALLATION

2.0L Engine

1. Disconnect the negative battery cable.

2. Remove the rocker arm cover.

3. Rotate the engine until the No. 4 cylinder is at TDC (top dead center) on the compression stroke. Remove the distributor cap and mark the rotor to housing position.

4. Release the tension on the automatic timing chain adjuster by performing the following procedures:

a. Using a small pry bar, depress the lock lever on the automatic adjuster rearward.

b. Push on the automatic adjuster shoe and lock it into the retracted position by releasing the lever.

5. Remove the camshaft sprocket-to-camshaft bolt, the sprocket and suspend the assembly on the wire; allow the chain to remain on the sprocket.

6. Remove the rocker arm brackets-to-cylinder head bolts and the rocker

arm bracket assembly from the cylinder head.

7. Remove the camshaft from the cylinder head.

To install:

8. Lubricate the camshaft with engine oil and install it onto the cylinder head.

9. Install the rocker arm assembly onto the cylinder head and torque the bolts to 16 ft. lbs.

10. Align the camshaft sprocket hole with camshaft dowel pin and install the sprocket. Torque the camshaft sprocket-to-camshaft bolt to 50–65 ft. lbs.

11. Set the automatic adjuster by turning the adjuster slide pin 90 degrees counter-clockwise with a small pry bar.

12. Adjust the valve lash.

13. Install the rocker arm cover and make sure the alignment marks are aligned.

14. To complete the installation, reverse the removal procedures. Start the engine and check and/or adjust the timing.

Location of the automatic chain adjuster—2.0L engine

2.3L and 2.6L Engines

1. Disconnect the negative battery cable.

2. Rotate the crankshaft to position the No. 4 cylinder on the TDC of its compression stroke.

3. Remove the distributor cap and move it aside. Matchmark the rotor to the distributor housing and the distributor housing to the engine. Remove the distributor.

4. Remove the rocker arm cover, the timing belt cover and the timing belt.

5. Remove the rocker arm assembly-to-cylinder head bolts, the rocker arm assembly and the camshaft. If necessary, remove the camshaft sprocket-to-camshaft bolt and the sprocket.

To install:

6. Lubricate the camshaft with engine oil and position it onto the cylinder head.

7. Install the rocker arm assembly and torque the bolts to 6 ft. lbs. (8 Nm) and the nuts to 16 ft. lbs. (22 Nm).

8. Align the timing marks and install the timing belt.

9. Using a new gasket, install the rocker arm cover.

10. Install the timing belt cover.

11. Align the matchmarks and install the distributor to the cylinder head.

12. To complete the installation, reverse the removal procedures.

13. With the timing marks aligned, start the engine, then, check and/or adjust the engine timing.

2.8L Engine

1. Relieve the fuel pressure. Disconnect the negative battery cable.

2. Remove the timing cover and the camshaft sprocket.

3. Remove the upper fan shroud and the radiator.

4. Disconnect the fuel line(s), the accelerator linkage, the vacuum hoses and electrical connectors from the throttle body unit.

5. Remove the rocker arm covers.

6. Loosen the valves, rotate them 90 degrees and remove the pushrods; be sure to keep them aligned so they may be installed in their original positions.

7. Remove the intake manifold.

8. Using a hydraulic lifter removal tool, pull the valve lifters from the engine.

9. Using 3 long bolts, thread them into the camshaft holes. Grasp the bolts and carefully, pull the camshaft from the front of the engine.

NOTE: All the camshaft bearing journals are the same diameter; exercise care in removing the camshaft so the bearings do not become damaged.

10. Lubricate the camshaft with engine oil and install it into the engine.

11. Using a hydraulic lifter installation tool, install the hydraulic lifters into the engine.

12. Using new gaskets and sealant, install the intake manifold.

13. Install the pushrods and the rocker arms.

14. Install the camshaft sprocket, the timing chain and the front cover; be sure the timing marks are aligned.

15. Adjust the valves.

16. Using new gaskets, install the rocker arm covers.

17. To complete the installation, reverse the removal procedures. Refill the cooling system.

18. Start the engine and allow it to reach normal operating temperatures. Check and/or adjust the timing.

Piston and Connecting Rod

POSITIONING

Positioning of the piston and compression rings
2.0L, 2.3L and 2.6L engines

Positioning of the piston and compression rings—2.8L engine

DIESEL ENGINE MECHANICAL

NOTE: Disconnecting the negative battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is reconnected.

Engine

REMOVAL & INSTALLATION

2wd Vehicles

1. Matchmark hinges to the hood and remove the hood.

2. Disconnect the battery cables, negative first and remove the battery from the vehicle.

3. Drain the cooling system.

4. Remove the air cleaner assembly as follows: Remove the intake silencer. Remove the bolts mounting the air cleaner and loosen the clamp bolt. Lift

the air cleaner slightly and disconnect the breather hose. Remove the air cleaner assembly.

5. Disconnect the upper radiator hose at the engine.

6. Loosen the air conditioning compressor drive belts by moving the power steering pump or idler.

7. Remove the cooling fan and fan shroud.

8. Disconnect the lower radiator hose at the engine.

9. Remove the radiator grille.

10. Remove the radiator attaching bolts and remove the radiator.

11. Disconnect the accelerator control cable from the injection pump.

12. If equipped with air conditioning, disconnect the air conditioning compressor control cable.

13. Disconnect and plug the fuel hoses from the injection pump.

14. Disconnect the ground cable from the engine.

15. Raise and safely support the vehicle. Disconnect and label the transmission wiring. Drain the engine oil.

16. Disconnect the vacuum hose from the fast idle actuator.

17. Disconnect the fuel cut solenoid wiring.

18. Disconnect the air conditioning compressor wiring, sensing resistor and thermoswitch connectors.

19. Disconnect the heater hoses extending from the heater unit from the dash panel side.

20. Disconnect the hose for power brake booster from the vacuum pump.

21. Disconnect vacuum hose from the vacuum pump.

22. Disconnect the alternator wiring.

23. Disconnect the exhaust pipe from the exhaust manifold at the flange.

24. Remove the exhaust pipe mounting bracket from the engine.

25. Disconnect and label the starter motor wiring.

26. Pull the gearshift lever boot upwards on the lever. Remove the 2 gearshift lever bolts and the lever.

27. Disconnect speedometer and ground cables from the transmission.

28. Matchmark and remove the driveshaft.

29. Remove the clutch fork return spring from the clutch fork.

30. Disconnect clutch cable from the hooked portion of clutch fork and pull it out forward through the stiffener bracket.

31. Remove 2 bracket-to-transmission rear mount bolts and nuts.

32. Raise the engine and transmission and remove the crossmember-to-frame bracket bolts.

33. Remove the rear mounting nuts from the transmission rear extension.

34. Disconnect electrical connectors at CRS switch and back-up lamp switch.

35. Raise the engine and remove the engine mounting bolts and nuts.

36. Remove the engine towards the front of the vehicle making sure the front of the engine is slightly above the level.

To install:

37. To install, reverse the removal procedures.

38. Refill the cooling system and the crankcase with engine oil. Check and adjust the clutch pedal freeplay.

38. Adjust the fan belt tension. Start the engine, run at idle and check for leakage. Adjust the ignition timing and engine idle speed.

4wd Vehicles

1. Matchmark the hinges to the hood and remove the hood.

2. Disconnect the battery cables, negative first and remove the battery from the vehicle.

3. Drain the cooling system and remove the upper and lower radiator hoses.

4. Remove the intake silencer. Remove the air cleaner mounting bolts and loosen the clamp bolt. Lift the air cleaner slightly and disconnect the

breather hose. Remove the air cleaner assembly.

5. Loosen the air conditioning compressor drive belts by moving the power steering pump or idler.

6. Remove the cooling fan and fan shroud.

7. Remove the radiator grille, the radiator bolts and the radiator.

8. Disconnect the accelerator control cable from the injection pump side.

9. If equipped with air conditioning, disconnect the air conditioner compressor control cable.

10. Disconnect and plug the fuel hose from the injection pump.

11. Disconnect the ground cable from the cylinder body.

12. Disconnect the transmission wiring.

13. Disconnect the vacuum hose from the fast idle actuator.

14. Disconnect the fuel cut solenoid wiring.

15. Disconnect the air conditioning compressor switch wiring, sensing resistor and the thermoswitch connectors.

16. Disconnect the heater hoses from the heater unit from the dash.

17. Disconnect the vacuum hoses from the vacuum pump.

18. Disconnect and label the alternator wiring.

19. Raise and safely support the vehicle. Drain the engine oil.

20. Disconnect the exhaust pipe from the exhaust manifold at the flange.

21. Remove the exhaust pipe mounting bracket from the engine back plate.

22. Disconnect and label the starter motor wiring. Remove the starter motor.

23. Pull the transmission/transfer case gearshift lever boots upward on each lever. Remove the gearshift lever bolts.

24. Remove return spring from transfer gear shift lever and the levers.

25. Remove the transmission/transfer case assembly.

26. Raise the engine slightly and remove the engine mounting bolts and nuts.

27. To remove the engine, check to make certain all the parts have been removed or disconnected frame the engine that are fastened to the frame side. Remove the engine toward front of the vehicle with the front part of the engine raised slightly above the level.

To install:

28. To install, reverse the removal procedures.

29. Refill the cooling system and the crankcase with engine oil. Check and adjust the clutch pedal freeplay.

30. Adjust the fan belt tension. Start the engine, run at idle and check for leakage.

31. Adjust the ignition timing and idle speed.

Cylinder Head

REMOVAL & INSTALLATION

1. Relieve the fuel pressure. Disconnect the negative battery cable. Drain the cooling system.

2. Remove the cooling fan assembly and the drive belt. Remove the alternator and bracket.

3. Remove the upper radiator hose and heater hose(s).

4. Remove the air cleaner and intake duct.

5. Label and disconnect the necessary vacuum hoses and electrical connectors.

6. Remove the fuel injector pipe, the clip and the nozzle holder assembly.

7. Remove the glow plugs and sensing resistor.

8. If equipped with a turbocharger, remove the turbocharger cover and the turbocharger.

9. Remove the intake and exhaust manifolds from the cylinder head; discard the gaskets.

10. Remove the rocker arm cover, the valve tappet chamber cover and rocker oil feed pipe.

11. Back off the rocker arm adjustments. Remove the rocker arm assembly-to-cylinder head bolts and the rocker arm assembly.

12. Remove the pushrods and keep them in order for reinstallation purposes.

13. Remove the cylinder head-to-engine bolts, a little at a time, by reversing the torquing sequence. Remove the cylinder head; it may be necessary to use a mallet to tap the cylinder head loose from the engine.

14. Discard the cylinder head gasket and clean the gasket mounting surfaces.

To install:

15. Using a new gasket, position it onto the engine with the work TOP facing upwards.

16. Refill the turbocharger with clean engine oil before installation.

17. Install the cylinder head onto the engine. Lubricate the cylinder head bolts with engine oil and torque them, in sequence, using the following procedure:

Turbocharged Engine

1st step: 33-40 ft. lbs.

2nd step: 120-150 degrees

Non-turbocharged Engine

1st step: 40-47 ft. lbs.

2nd step: 54-61 ft. lbs. (new bolt)

Exploded view of the engine components—2.2L diesel engine

View of the cylinder head bolt torque sequence—2.2L diesel engine

or 61–69 ft. lbs. (used bolt)

18. Install the pushrods and make sure they are positioned in the tappets.
19. Install the rocker arm assembly and torque the rocker arm-to-cylinder head bolts to 9–17 ft. lbs. Adjust the valve lash.

20. Using new gaskets, reverse the removal procedures.

21. Refill the cooling system. Connect the negative battery cable. Start the engine and check for leaks.

Valve Lash

ADJUSTMENT

1. Disconnect the negative battery cable.

2. Remove the rocker arm cover. Loosen the valve adjuster locknuts.

3. Rotate the crankshaft to position the No. 1 cylinder at the TDC of its compression stroke.

NOTE: When adjusting the valves, position the feeler gauge

between the rocker arms and the valve stems.

4. Using a 0.016 in. feeler gauge, with the engine cold, adjust the valves of the following cylinders:

Intake valves: 1 and 2

Exhaust valves: 1 and 3

5. Rotate the crankshaft, 1 complete revolution, to position the No. 4 cylinder at the TDC of its compression stroke.

6. Using a 0.016 in. feeler gauge, with the engine cold, adjust the valves of the following cylinders:

Intake valves: 3 and 4

Exhaust valves: 2 and 4

7. Tighten the valve adjustment locknuts.

8. Using a new gasket, install the rocker arm cover. Connect the negative battery cable.

9. Start the engine, check for leaks. Check and/or adjust the engine speed.

Rocker Arms/Shaft

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the air cleaner and air duct, if equipped.
3. Label and disconnect any vacuum line or electrical connector which may be in the way.
4. Remove the rocker arm cover.
5. Loosen the rocker arm adjusters.
6. Remove the rocker arm-to-cylinder head bolts and the rocker arm assembly.

7. If necessary, slide the rocker arm components from the rocker arm shaft; be sure to keep the components in order for reinstallation purposes.

To install:

8. Assemble the rocker arm components onto the rocker arm shaft.
9. Install the rocker arm shaft assembly onto the cylinder head and torque the bolts to 9-17 ft. lbs.
10. Adjust the valve lash.
11. Using a new gasket, install the rocker arm cover.
12. Connect the negative battery cable. Start the engine and check for leaks.
13. Check and/or adjust the idle speed.

Combination Manifold

Although the intake and exhaust manifolds are individual parts, they must be removed at the same time so the 1-piece gasket may be replaced.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the air cleaner and air duct, if necessary.
3. Disconnect the accelerator cable from the throttle body.
4. Label and disconnect the necessary vacuum hoses and electrical connectors.
5. If not equipped with a turbocharger, disconnect the exhaust manifold from the exhaust pipe.
6. If equipped with a turbocharger, perform the following procedures:
 - a. Disconnect the intake and exhaust hoses from the turbocharger.
 - b. Disconnect the oil lines from the turbocharger.
 - c. Remove the turbocharger-to-exhaust manifold nuts, the turbocharger assembly-to-exhaust pipe nuts and the turbocharger assembly.
7. Remove the intake manifold-to-cylinder head bolts and the intake manifold.

View of the rocker arm assembly torque sequence—2.2L diesel engine

Positioning the intake/exhaust manifold gasket—2.2L diesel engine

8. Remove the exhaust manifold-to-cylinder head bolts, the exhaust manifold and discard the gasket.

9. Clean the gasket mounting surfaces.

To install:

10. Using a new gasket, install it onto the cylinder head with the center mark facing outward and upward.
11. Install the exhaust and intake manifolds onto the cylinder head and torque the nuts/bolts to 10-17 ft. lbs. (non-turbocharged engine) or 13-17 ft. lbs. (turbocharged engine).
12. If not equipped with a turbocharger, install the exhaust manifold to the exhaust pipe.
13. If equipped with a turbocharger, perform the following procedures:
 - a. Refill the turbocharger with clean engine oil.
 - b. Install the turbocharger-to-exhaust manifold nuts to 16-23 ft. lbs. and the turbocharger assembly-to-exhaust pipe nuts to 16-23 ft. lbs.
 - c. Connect the oil feed lines to the turbocharger.
14. To complete the installation, reverse the removal procedures.

Exploded view of the intake/exhaust manifold and turbocharger assembly—2.2L diesel engine—non-turbocharger manifold is similar

Turbocharger

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the air cleaner and air duct.
3. Disconnect the intake and exhaust hoses from the turbocharger.
4. Disconnect the oil lines from the turbocharger.
5. Remove the turbocharger-to-exhaust manifold nuts, the turbocharger assembly-to-exhaust pipe nuts and the turbocharger assembly.
6. Clean the gasket mounting surfaces. Refill the turbocharger with clean engine oil.

To install:

7. Using a new gasket, install the turbocharger-to-exhaust manifold nuts to 16–23 ft. lbs. and the turbocharger assembly-to-exhaust pipe nuts to 16–23 ft. lbs.
8. Connect the oil feed lines to the turbocharger.
9. To complete the installation, reverse the removal procedures.

Timing Belt Front Cover

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Drain the cooling system.
2. Remove the cooling fan assembly and the drive belt(s). Remove the alternator and bracket.
3. Remove the radiator hoses and the radiator.
4. Label and disconnect the necessary vacuum hoses and electrical connectors.
5. Remove the crankshaft pulley.
6. Remove the timing belt cover-to-engine bolts and the cover.
7. To install, reverse the removal procedures. Refill the cooling system. Connect the negative battery cable.
8. Start the engine, allow it to reach normal operating temperatures and check for leaks.

OIL SEAL REPLACEMENT

1. Disconnect the negative battery terminal. Drain the cooling system.
2. Remove the timing belt.
3. Remove the crankshaft sprocket bolt.

NOTE: To remove the crankshaft sprocket bolt, it may be necessary to remove the starter or the flywheel cover plate to lock the flywheel; otherwise, it may be difficult to keep the crankshaft from turning.

Pressing the crankshaft center and timing sprocket from the crankshaft—2.2L diesel engine

4. Using a puller tool press the crankshaft center and timing sprocket from the crankshaft.
5. Remove the oil seal retainer-to-rear timing cover bolts and the retainer.

6. Using a small pry bar, pry the oil seal from engine housing; be careful not to damage the crankshaft or the oil seal mounting surface.

To install:

7. Using a new oil seal, lubricate the seal lips with engine oil and install it into the engine using a seal installation tool.
8. Install the oil seal retainer.
9. Install the crankshaft center and timing sprocket to the crankshaft.
10. Install the timing belt.
11. To complete the installation, reverse the removal procedures.
12. Refill the cooling system. Start the engine, check and/or adjust the timing and check for leaks.

Timing Belt and Tensioner

ADJUSTMENT

1. Disconnect the negative battery cable. Drain the cooling system.
2. Remove the timing belt cover and temporarily install the crankshaft pulley.
3. Rotate the crankshaft until the No. 1 cylinder is at the TDC of its compression stroke; make sure the alignment mark on the crankshaft pulley is aligned with timing indicator. Make sure the timing marks on the camshaft sprocket and the injection pump sprocket are facing each other at their closest point.

NOTE: Any timing belt slack will be absorbed between the injection pump sprocket and camshaft sprocket.

4. Adjust the timing belt tensioner pulley so the end of the tension center is fitted against the 2 pins on the timing pulley housing; hand tighten the nut, so the tension pulley can be rotated freely.

5. Make sure the tension spring is installed correctly. Torque the tension pulley nut to 22–36 ft. lbs.

6. Rotate the crankshaft 2 complete revolutions in the clockwise direction. Further, turn the crankshaft 90 degrees beyond TDC to settle the injection pump.

Exploded view of the timing belt assembly—2.2L diesel engine

7. Loosen the tension pulley nut to allow the timing belt slackness to be taken up, then, tighten the tension pulley nut to 79–94 ft. lbs.

NOTE: Never attempt to rotate the crankshaft counterclockwise.

8. Using a belt tension gauge, measure the belt tension between the injection pump sprocket and the crankshaft sprocket; it should be 33–55 lbs.

9. To complete the installation, reverse the removal procedures.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Drain the cooling system.

2. Remove the timing belt cover. Remove the injection pump sprocket flange.

3. Using a pry bar, remove the tension spring from the timing belt tensioner.

NOTE: When removing the tension spring, avoid using excessive force for the spring may become distorted.

4. Remove the tensioner pulley bolt and the pulley.

5. Remove the timing belt and discard it.

To install:

6. Rotate the crankshaft to bring the No. 1 piston to TDC of the compression stroke.

7. Align the timing marks on the injection pump sprocket with the camshaft sprocket; the marks must be facing each other.

8. Using a new timing belt, install it in the following sequence: crankshaft sprocket, camshaft sprocket and the injection pump sprocket; the slack must be between the injection pump and camshaft sprockets.

9. Install the tension center and the tension pulley so the end of the tension center is fitted against both pins on the timing pulley housing.

10. Hand tighten the nut so the tension pulley can be rotated freely.

11. Install the tension spring and semi-tighten the pulley nut to 22–36 ft. lbs.

12. Rotate the crankshaft 2 full turns clockwise to seat the belt and further turn the crankshaft 90 degrees beyond TDC to settle the injection pump.

13. Loosen the tension pulley nut to take up the timing belt slack. Tighten the tension pulley nut to 79–94 ft. lbs.

14. Install the injection pump sprocket flange; the hole in the outer circumference of the flange should be aligned with the triangular timing mark on the injection pump sprocket.

15. Rotate the crankshaft 2 full

turns clockwise to bring the No. 1 piston to TDC of the compression stroke. Make sure the triangular timing mark on the timing sprocket is aligned with the hole in the flange, then, measure the timing belt tension; it should be 33–55 lbs.

16. Install the timing belt cover.

17. To complete the installation, reverse the removal procedures.

18. Connect the negative battery cable.

Timing Sprockets

REMOVAL & INSTALLATION

Injection Pump Sprocket

1. Disconnect the negative battery cable. Drain the cooling system.

2. Remove the timing belt cover. Remove the injection pump sprocket flange.

3. Using a pry bar, remove the tension spring from the timing belt tensioner.

NOTE: When removing the tension spring, avoid using excessive force for the spring may become distorted.

4. Remove the tensioner pulley bolt and the pulley.

5. Remove the timing belt and discard it.

6. Using a 6mm, 1.25 pitch bolt, install the threaded portion into the threaded hole in the timing sprocket housing through the hole in the sprocket to prevent the sprocket from turning.

7. Remove the injection pump sprocket-to-shaft bolts.

8. Using a wheel puller, connect it to the injection pump sprocket and press it from the shaft.

To install:

9. Install the injection pump sprocket by aligning it with the key groove and torque the bolt to 42–52 ft. lbs.

10. Rotate the crankshaft to bring the No. 1 piston to TDC of the compression stroke.

11. Align the timing marks on the injection pump sprocket with the camshaft sprocket; the marks must be facing each other.

12. Using a new timing belt, install it in the following sequence: crankshaft sprocket, camshaft sprocket and the injection pump sprocket; the slack must be between the injection pump and camshaft sprockets.

13. Install the tension center and the tension pulley so the end of the tension center is fitted against both pins on the timing pulley housing.

14. Hand tighten the nut so the tension pulley can be rotated freely.

15. Install the tension spring and semi-tighten the pulley nut to 22–36 ft. lbs.

16. Rotate the crankshaft 2 full turns clockwise to seat the belt and further turn the crankshaft 90 degrees beyond TDC to settle the injection pump.

17. Loosen the tension pulley nut to take up the timing belt slack. Tighten the tension pulley nut to 79–94 ft. lbs.

18. Install the injection pump sprocket flange; the hole in the outer circumference of the flange should be aligned with the triangular timing mark on the injection pump sprocket.

19. Rotate the crankshaft 2 full turns clockwise to bring the No. 1 piston to TDC of the compression stroke. Make sure the triangular timing mark on the timing sprocket is aligned with the hole in the flange, then, measure the timing belt tension; it should be 33–55 lbs.

20. Install the timing belt cover.

21. To complete the installation, reverse the removal procedures.

22. Connect the negative battery cable. Refill the cooling system.

Camshaft Sprocket

1. Disconnect the negative battery cable.

2. Remove the timing belt cover. Remove the injection pump sprocket flange.

3. Using a pry bar, remove the tension spring from the timing belt tensioner.

NOTE: When removing the tension spring, avoid using excessive force for the spring may become distorted.

4. Remove the tensioner pulley bolt and the pulley.

5. Remove the timing belt and discard it.

6. Using a 6mm, 1.25 pitch bolt, install the threaded portion into the threaded hole in the camshaft sprocket housing through the hole in the sprocket to prevent the sprocket from turning.

7. Using a wheel puller, connect it to the camshaft sprocket and press it from the camshaft.

To install:

8. Install the camshaft sprocket and torque the camshaft sprocket-to-camshaft bolt to 72–87 ft. lbs.

9. Rotate the crankshaft to bring the No. 1 piston to TDC of the compression stroke.

10. Align the timing marks on the injection pump sprocket with the camshaft sprocket; the marks must be facing each other.

11. Using a new timing belt, install it in the following sequence: crankshaft

sprocket, camshaft sprocket and the injection pump sprocket; the slack must be between the injection pump and camshaft sprockets.

12. Install the tension center and the tension pulley so the end of the tension center is fitted against both pins on the timing pulley housing.

13. Hand tighten the nut so the tension pulley can be rotated freely.

14. Install the tension spring and semi-tighten the pulley nut to 22–36 ft. lbs.

15. Rotate the crankshaft 2 full turns clockwise to seat the belt and further turn the crankshaft 90 degrees beyond TDC to settle the injection pump.

16. Loosen the tension pulley nut to take up the timing belt slack. Tighten the tension pulley nut to 79–94 ft. lbs.

17. Install the injection pump sprocket flange; the hole in the outer circumference of the flange should be aligned with the triangulartiming mark on the injection pump sprocket.

18. Rotate the crankshaft 2 full turns clockwise to bring the No. 1 piston to TDC of the compression stroke. Make sure the triangulartiming mark on the timing sprocket is aligned with the hole in the flange, then, measure the timing belt tension; it should be 33–55 lbs.

19. Install the timing belt cover.

20. To complete the installation, reverse the removal procedures.

21. Connect the negative battery cable. Refill the cooling system.

Crankshaft Sprocket

1. Disconnect the negative battery cable. Drain the cooling system.

2. Remove the timing belt cover.

3. Using a pry bar, remove the tension spring from the timing belt tensioner.

NOTE: When removing the tension spring, avoid using excessive force for the spring may become distorted.

4. Remove the tensioner pulley bolt and the pulley.

5. Remove the timing belt and discard it.

6. Remove the crankshaft sprocket bolt.

NOTE: To remove the crankshaft sprocket bolt, it may be necessary to remove the starter or the flywheel cover plate to lock the flywheel; otherwise, it may be difficult to keep the crankshaft from turning.

7. Using a puller tool press the crankshaft center and timing sprocket from the crankshaft.

To install:

8. Install the crankshaft center and timing sprocket to the crankshaft and install the bolt.

9. Rotate the crankshaft to bring the No. 1 piston to TDC of the compression stroke.

10. Align the timing marks on the injection pump sprocket with the camshaft sprocket; the marks must be facing each other.

11. Using a new timing belt, install it in the following sequence; crankshaft sprocket, camshaft sprocket and the injection pump sprocket; the slack must be between the injection pump and camshaft sprockets.

12. Install the tension center and the tension pulley so the end of the tension center is fitted against both pins on the timing pulley housing.

13. Hand tighten the nut so the tension pulley can be rotated freely.

14. Install the tension spring and semi-tighten the pulley nut to 22–36 ft. lbs.

15. Rotate the crankshaft 2 full turns clockwise to seat the belt and further turn the crankshaft 90 degrees beyond TDC to settle the injection pump.

16. Loosen the tension pulley nut to take up the timing belt slack. Tighten the tension pulley nut to 79–94 ft. lbs.

17. Install the injection pump sprocket flange; the hole in the outer circumference of the flange should be aligned with the triangulartiming mark on the injection pump sprocket.

18. Rotate the crankshaft 2 full turns clockwise to bring the No. 1 piston to TDC of the compression stroke. Make sure the triangulartiming mark on the timing sprocket is aligned with the hole in the flange, then, measure the timing belt tension; it should be 33–55 lbs.

19. Install the timing belt cover.

20. To complete the installation, reverse the removal procedures.

21. Connect the negative battery cable. Refill the cooling system.

Camshaft

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Drain the crankcase. Remove the oil pan and the oil pump.

3. Remove the timing belt cover, the timing belt, the camshaft sprocket.

4. Remove the rocker arm assembly, the pushrods and the valve lifters; be sure to keep the parts in order for reinstallation purposes.

5. Remove the camshaft retainer-to-engine bolts and the retainer. Using a small pry bar, pry the oil seal from the cylinder block.

6. Screw a bolt into the camshaft and carefully remove the camshaft from the front of the engine; be careful not to damage the bearing surfaces.

7. Inspect the camshaft for wear, scoring and/or damage; if necessary, replace it.

To install:

8. Lubricate the camshaft with engine oil and insert it into the front of the engine.

9. Using a new oil seal, lubricate the seal lips with engine oil and install it into the engine.

10. Install the camshaft retainer and the camshaft sprocket.

11. Install the oil pump and the oil pan.

12. Install the valve lifters, the pushrods and the rocker arm assembly.

13. Install and adjust the timing belt. Install the timing belt cover.

14. Rotate the crankshaft to bring the No. 1 piston to TDC of the compression stroke and adjust the valve lash.

15. To complete the installation, reverse the removal procedures.

16. Refill the cooling system and the crankcase.

17. Connect the negative battery cable. Start the engine, allow it to reach normal operating temperatures.

18. Check and/or adjust the idle speed and timing.

Piston and Connecting Rod

POSITIONING

Positioning of the piston and connecting rod—2.2L diesel engine

ENGINE LUBRICATION

Oil Pan

REMOVAL & INSTALLATION

2.0L and 2.3L Engines—1986-87

NOTE: On 4WD gasoline engines, the engine must be removed before removing the oil pan.

1. Disconnect the negative battery cable.
2. Raise and safely support the vehicle.
3. Drain the engine oil.
4. Remove the front splash shield, if equipped.
5. If equipped with a crossmember, remove it.
6. Disconnect the relay rod at the idler arm and lower the relay rod.
7. Remove the left side bellhousing bracket.
8. Disconnect the vacuum line from the oil pan.
9. Remove the oil pan bolts and remove the oil pan.
10. Clean the gasket mounting surfaces.
11. Using a new gasket and sealant, install the oil pan. Torque the oil pan-to-engine bolts to 35–51 inch lbs. (2.0L engine) or 11–15 ft. lbs. (2.3L engine).
12. To complete the installation, reverse the removal procedure. Refill the crankcase.

Use sealant at the indicated points when installing the pan gasket—2.0L and 2.3L engines—1986–87

2.2L Diesel Engine—1986–87

UPPER OIL PAN

1. Disconnect the negative battery cable.
2. Remove the engine from the vehicle.
3. Drain the engine oil. Remove the dipstick and the dipstick tube.
4. Remove the upper oil pan-to-engine bolts and the oil pan.
5. Clean the gasket mounting surfaces.
6. Using a new gasket and sealant, install the oil pan. Torque the oil pan-to-engine bolts to 10–17 ft. lbs.
7. To complete the installation, reverse the removal procedure. Refill the crankcase.

Exploded view of the upper and lower oil pans—2.2L diesel engine

LOWER OIL PAN

1. Raise and safely support the vehicle.
2. Drain the crankcase.
3. Remove the lower oil pan-to-upper oil pan bolts and the lower pan.
4. Clean the gasket mounting surfaces.
5. Using a new gasket and sealant, install the lower oil pan and torque the bolts to 24–96 inch lbs.
6. Refill the crankcase.

2.3L and 2.6L Engines—1988–90

2WD VEHICLES

1. Disconnect the negative battery cable.
2. Raise and safely support the vehicle.
3. Drain the engine oil. Remove the dipstick and the dipstick tube.
4. Remove the front splash shield, if equipped.
5. If equipped with a crossmember, remove it.
6. Disconnect the relay rod at the idler arm and lower the relay rod.
7. Remove the oil pan bolts and remove the oil pan.
8. Clean the gasket mounting surfaces.
9. Using a new gasket and sealant, install the oil pan. Torque the oil pan-to-engine bolts to 48–72 inch lbs.
10. To complete the installation, reverse the removal procedure. Refill the crankcase.

4WD VEHICLES—UPPER OIL PAN

1. Disconnect the negative battery cable.
2. Remove the engine from the vehicle.

3. Drain the engine oil. Remove the dipstick.
4. Remove the upper oil pan-to-engine bolts and the oil pan.
5. Clean the gasket mounting surfaces.
6. Using a new gasket and sealant, install the oil pan. Torque the oil pan-to-engine bolts to 13–22 ft. lbs.
7. To complete the installation, reverse the removal procedure. Refill the crankcase.

4WD VEHICLES—LOWER OIL PAN

1. Raise and safely support the vehicle.
2. Drain the crankcase.
3. Remove the lower oil pan-to-upper oil pan bolts and the lower pan.
4. Clean the gasket mounting surfaces.
5. Using a new gasket and sealant, install the lower oil pan and torque the bolts to 47–94 inch lbs.
6. Refill the crankcase.

Exploded view of the oil pan used with 4WD—2.3L and 2.6L engines—1988–90

2.8L Engine

1. Disconnect the negative battery cable.
2. Remove the dipstick. Raise and safely support the vehicle. Drain the crankcase.
3. Remove the front skid plate and the crossmember.
4. Remove the exhaust pipe-to-catalytic converter bolts, the exhaust pipe-to-manifolds bolts and the Y-exhaust pipe.
5. Remove the front driveshaft from the front differential.
6. Remove the braces from the flywheel cover.
7. Disconnect the electrical connectors from the starter. Remove the starter-to-engine bolts and the starter.
8. Remove the flywheel inspection cover.
9. Matchmark the pitman arm-to-pitman shaft for reassembly. Remove the pitman arm-to-pitman arm shaft nut and separate the pitman arm from the pitman shaft.
10. Remove the idler arm-to-shaft nut and separate the idler arm from the shaft.

Exploded view of the oil pan assembly—2.8L engine

11. Remove the rubber hose from the front axle vent and support the axle housing assembly.

12. Remove both bolts from the left axle housing isolator and the right axle housing isolator, then, lower the front axle housing assembly.

13. Remove the oil pan-to-engine bolts, the oil pan and discard the gasket.

14. Clean the gasket mounting surfaces.

To install:

15. Using a new gasket and sealant, install the oil pan. Torque both rear pan-to-engine bolts to 18 ft. lbs. (25 Nm) and the other bolts/nuts/studs to 7 ft. lbs. (10 Nm).

16. To complete the installation, reverse the removal procedures. Torque the following fasteners:

Pitman arm-to-pitman shaft nut—159 ft. lbs. (215 Nm)

Idler arm-to-shaft nut—86 ft. lbs. (117 Nm)

Front drive axle shaft bolts—46 ft. lbs. (62 Nm)

17. Refill the crankcase. Connect the negative battery cable.

18. Start the engine and check for leaks.

Oil Pump

REMOVAL & INSTALLATION

2.0L Engine

The oil pump is located in the oil pan and is attached to the front cover.

1. Disconnect the negative battery cable. Raise and safely support the vehicle.

2. Rotate the crankshaft to position the No. 1 or No. 4 cylinder at the TDC of its compression stroke.

3. Drain the crankcase and remove the oil pan.

4. Remove the oil pick-up-to-engine bolt and the oil pick-up tube from the oil pump.

5. Remove the oil pump-to-front cover bolts and the oil pump.

To install:

6. Turn the punch mark on the oil pump drive gear toward the oil filter and align the center of the oil pump drive gear with the mark on the oil pump case.

7. Insert the oil pump into the front cover.

NOTE: When installing the oil pump, turn the oil pump shaft so the drive gear engages with the drive pinion. When installed, the punch mark on the drive gear should be facing the main bearings and the shaft tang must be engaged with the distributor shaft.

8. To complete the installation, reverse the removal procedures.

9. Refill the crankcase. Connect the negative battery cable.

10. Start the engine and check for leaks.

2.3L and 2.6L Engines

The oil pump is attached to the front, lower right side of the engine and is driven by the timing belt.

1. Remove the upper and lower timing belt covers.

2. Remove the timing belt from the crankshaft and oil pump sprockets.

3. Remove the oil pump sprocket-to-oil pump nut and the sprocket from the oil pump.

4. Using a 6mm Allen wrench, remove the oil pump-to-engine bolts and the oil pump.

To install:

5. Using petroleum jelly, pack the oil pump.

6. Using a new O-ring, install the oil pump and torque the bolts to 10–17 ft. lbs.

7. Install the sprocket to the oil pump and torque the nut to 48–62 ft. lbs.

8. Align the timing marks on the camshaft and crankshaft sprockets and install the timing belt.

9. To complete the installation, reverse the removal procedures.

View of the oil pump—2.3L and 2.6L engines

2.8L Engine

The oil pump is attached to the cylinder block and is located in the oil pan.

1. Disconnect the negative battery cable. Raise and safely support the vehicle.

2. Drain the crankcase. Remove the oil pan.

3. Remove the oil pump-to-engine bolts and the oil pump.

To install:

4. Align the oil pump shaft with the hexagon socket and install the pump. Torque the oil pump-to-engine bolts to 30 ft. lbs. (41 Nm).

5. Install the oil pan.

6. To complete the installation, reverse the removal procedures.

7. Connect the negative battery cable. Start the engine and check for leaks.

2.2L Diesel Engine

1. Disconnect the negative battery cable.

2. Remove the engine from the vehicle.

3. Remove the oil pan.

4. Remove the oil pipe from the oil pump. Remove the oil pump-to-engine bolts and the oil pump.

5. Clean the gasket mounting surfaces.

6. Using a new gasket, install the oil pump and connect the oil pipe to the oil pump. Install and torque the oil pump-to-engine bolts to 10–17 ft. lbs.

7. To complete the installation, reverse the removal procedure. Refill the crankcase.

CHECKING

2.0L Engine

1. Visually inspect the oil pump for wear, damage or other abnormal conditions.

2. Remove the oil pump cover from the bottom of the oil pump.

3. Using a feeler gauge, measure the clearance between the pump body and the vane; it should be 0.0063–0.0086 in. (0.16–0.22mm), if not, replace the entire pump assembly.

4. Using a feeler gauge, measure the clearance between the rotor and the vane; it should be 0.0051–0.0059 in. (0.13–0.15mm), if not, replace the rotor set: pin, shaft, rotor and vane.

5. Place a straight edge across the bottom of the oil pump and a feeler gauge between the straight edge and the rotor; the clearance between the rotor/vane-to-cover should be 0.0011–0.0035 in. (0.03–0.09mm), if not, replace the rotor set: pin, shaft, rotor and vane.

6. Using a feeler gauge, measure the clearance between the pump body and the rotor shaft; it should be less than 0.0079 in. (0.2mm), if not, replace the entire pump assembly.

2.3L and 2.6L Engines

1. Visually inspect the oil pump for wear, damage or other abnormal conditions.

- A. Front
40. Bolt
41. Oil pump
42. Shaft

Exploded view of the oil pump assembly—2.8L engine

2. Insert the oil pump vane into the cylinder block.

3. Place a straight edge across the oil pump opening and a feeler gauge between the straight edge and the vane; the clearance between the vane-to-cylinder block surface should be 0.002–0.004 in. (0.04–0.09mm), if not, replace the vane.

4. Using a feeler gauge, measure the side clearance between the cylinder block and the vane; it should be 0.009–0.0014 in. (0.24–0.36mm), if not, replace the vane.

5. Position the vane onto the rotor shaft.

6. Using a feeler gauge, measure the clearance between the rotor and the vane; it should be 0.005–0.006 in. (0.13–0.15mm), if not, replace the rotor and/or vane.

2.2L Diesel Engine

1. Visually inspect the oil pump for wear, damage or other abnormal conditions.

2. Remove the oil pump cover from the bottom of the oil pump.

3. Place a straight edge across the bottom of the oil pump and a feeler gauge between the straight edge and the rotor; the clearance between the rotor/vane-to-cover should be 0.0008–0.0028 in. (0.02–0.07mm), if not, replace the rotor set: pin, shaft, rotor and vane.

4. Using a feeler gauge, measure the clearance between the rotor and the vane; it should be less than 0.0055 in. (0.14mm), if not, replace the rotor set: pin, shaft, rotor and vane.

5. Using a feeler gauge, measure the clearance between the pump body and the vane; it should be 0.0079–0.0106 in. (0.2–0.27mm), if not, replace the entire pump assembly.

6. Using a feeler gauge, measure the clearance between the pump body and the rotor shaft; it should be less than 0.0079 in. (0.2mm), if not, replace the entire pump assembly.

NOTE: When necessary to replace the pinion and shaft, install the shaft in the pump body and set the pinion on the shaft. Drill a hole through the pinion and shaft using a 5mm drill, then, install and stake the pin.

Rear Main Bearing Oil Seal

REMOVAL & INSTALLATION

Lip Type Seal

2.0L ENGINE

1. Disconnect the negative battery cable. Raise and safely support the vehicle.

2. Drain the engine oil and remove the oil pan.

3. If equipped with an automatic transmission, remove the transmission. If equipped with a manual transmission, remove the transmission and clutch assembly.

4. Remove the starter without disconnecting the wires and secure it aside.

5. Remove the flywheel-to-crankshaft bolts and the flywheel.

6. Remove the rear main seal retainer-to-engine bolts and the retainer.

7. Carefully, remove the oil seal, using a small pry bar; work the tool around the diameter of the seal until the seal begins to lift out. Use care not to damage the seat and area around the seal.

8. Fill the space between the seal lips with grease and lubricate the seal lips with clean engine oil. Install the new oil seal.

9. To complete the installation, reverse the removal procedures.

EXCEPT 2.0L ENGINE

1. Disconnect the negative battery cable. Raise and safely support the vehicle.

2. If equipped with an automatic transmission, remove the transmission. If equipped with a manual transmission, remove the transmission and clutch assembly.

3. Remove the starter without disconnecting the wires and secure it aside.

4. Remove the flywheel-to-crankshaft bolts and the flywheel.

5. Using a small pry bar, carefully, remove the oil seal work the tool around the diameter of the seal until the seal begins to lift out. Use care not to damage the seat and area around the seal.

6. Using a new oil seal, lubricate the seal lips with clean engine oil.

7. Using an oil seal installation tool, install the new oil seal.

8. To complete the installation, reverse the removal procedures.

12. Disconnect the electrical connector from the back-up light switch.

13. Remove the transmission-to-engine bolts.

14. Move the transmission rearward and disengage it from the clutch. Tip the front of the transmission downward and remove it.

To install:

15. To install, position the transmission in the vehicle and slide it forward, guiding the input shaft into the pilot bearing.

16. Install the transmission-to-engine bolts.

17. Raise and lower the engine/transmission assembly and install the cross-member frame bracket and rear mount.

18. Install the flywheel cover.

19. Align the driveshaft matchmarks and install it.

20. Connect the speedometer cable, the ground cable and the exhaust pipe hanger.

21. Connect the clutch cable and adjust the shift fork.

22. Connect the electrical connector to the back-up light switch. Refill the transmission with lubricant.

23. Lower the vehicle and install the starter assembly.

24. Connect the negative battery cable.

25. Install the gearshift lever and adjust the clutch cable.

26. Check the transmission operation.

1988-90

1. Disconnect the negative battery cable.

2. Remove the undercover, if equipped.

3. Remove the air cleaner (2.3L engine) or air cleaner duct and hose (2.6L engine). Using a clean shop cloth, cover the air cleaner port to prevent dirt from entering the engine.

4. Label and disconnect the necessary hoses and electrical connectors.

5. Remove the clutch return spring, the clutch control cable, the back-up light switch connector and the speedometer cable from the transmission.

6. Remove the gear shift lever by performing the following procedures:

a. Place the gear shift lever in N.

b. Remove the front console from the floor panel.

c. Pull the shift lever boot and grommet upward.

d. Remove the shift lever cover bolts and the shift lever.

7. Raise and safely support the vehicle. Remove the front wheels.

8. Drain the transmission fluid.

9. If equipped with a 1-piece driveshaft, remove the driveshaft flange-to-pinion nuts, lower the driveshaft and pull it from the transmission.

10. If equipped with a 2-piece driveshaft, perform the following procedures:

a. Remove the rear driveshaft flange-to-pinion nuts.

b. Remove the rear driveshaft flange-to-front driveshaft flange bolts and the rear driveshaft.

c. Remove the center bearing-to-chassis bolts, move the front driveshaft rearward and from the transmission.

11. Remove the starter-to-engine bolts and the starter.

12. Remove the exhaust pipe-to-exhaust manifold nuts, the exhaust pipe bracket-to-transmission bolts, the front exhaust pipe-to-2nd exhaust pipe bolts and the front exhaust pipe from the vehicle.

13. Attach an engine hanger to the rear of the exhaust manifold.

14. Using an engine hoist, connect it to the engine hangers and support the engine.

15. Using a transmission jack, place it under the transmission; do not support it.

16. Remove the rear mount-to-transmission nuts.

17. Remove the rear mount-to-cross-member nuts/bolts and the mount.

NOTE: Further removal of the transmission may require an assistant.

18. Remove the clutch cover and the transmission-to-engine bolts.

19. Move the transmission rearward into the crossmember and floor pan area; the transmission may rest on the crossmember.

20. Lower the front of the transmission toward the jack.

21. Firmly, grasp the transmission the rear cover while the assistant raises the jack toward the transmission.

22. Carefully, lower the transmission onto the jack and center it.

23. Lower the jack and move the transmission rearward.

To install:

NOTE: Installation of the transmission may require an assistant.

24. Raise the transmission into position.

25. Raise the rear of the transmission and move it into position on the crossmember.

26. Move the transmission forward and engage it with the engine.

27. Install the engine-to-transmission bolts.

28. Install the mount and the rear mount-to-crossmember nuts/bolts.

29. Install the rear mount-to-transmission nuts.

MANUAL TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transmission Assembly

REMOVAL & INSTALLATION

2wd Vehicles

1986-87

1. Disconnect the negative battery cable.

2. Slide the gearshift lever boot upwards on the lever. Remove the gearshift lever bolts and the lever.

3. Remove the starter-to-engine bolts and move the starter aside.

4. Raise and safely support the vehicle. Disconnect the exhaust pipe hanger from the transmission.

5. Drain the transmission. Disconnect the speedometer cable and ground cable. Matchmark and remove the driveshaft.

6. Remove the clutch fork return spring and the clutch cable.

7. Remove the flywheel cover plate.

8. Remove the frame bracket-to-transmission rear mount bolts and nuts.

9. Raise the engine/transmission assembly and remove the crossmember-to-frame bracket bolts.

10. Remove the rear mounting nuts from the transmission rear extension.

11. Lower the engine/transmission assembly and support the rear of the engine.

30. Remove the engine hoist and the engine hanger from the rear of the exhaust manifold.

31. Install the front exhaust pipe, exhaust pipe-to-exhaust manifold nuts, the exhaust pipe bracket-to-transmission bolts, the front exhaust pipe-to-2nd exhaust pipe bolts.

32. Install the starter and the starter-to-engine bolts.

33. If equipped with a 2-piece driveshaft, perform the following procedures:

a. Install the front driveshaft into the transmission and the center bearing-to-chassis bolts.

b. Install the rear driveshaft and the rear driveshaft flange-to-front driveshaft flange bolts.

c. Install the rear driveshaft flange-to-pinion nuts.

34. If equipped with a 1-piece driveshaft, install the driveshaft into the transmission and the driveshaft flange-to-pinion nuts.

35. Install the front wheels and lower the vehicle.

36. Install the gear shift lever by performing the following procedures:

a. Install the shift lever and the shift lever cover bolts.

b. Push the grommet and shift lever boot downward.

c. Install the front console to the floor panel.

37. Install the clutch return spring, the clutch control cable, the back-up light switch connector and the speedometer cable to the transmission.

38. Connect the necessary hoses and electrical connectors.

39. Install the air cleaner (2.3L) or air cleaner duct and hose (2.6L).

40. Refill the transmission. Install the undercover, if equipped.

41. Connect the negative battery cable.

4wd Vehicles

1986-87

4WD vehicles require that the transmission and transfer case be removed as an assembly.

1. Disconnect the negative battery cable.

2. Slide the shift lever boots upward and unbolt each lever.

3. Remove the return spring from the transfer case shift lever and remove both levers.

4. Raise and safely support the vehicle. Label and disconnect the starter wiring. Remove the starter-to-engine bolts and the starter.

5. Disconnect the exhaust pipe from the manifold and disconnect the pipe support from the transmission.

6. Drain the transmission. Matchmark and remove the driveshaft.

7. Disconnect the speedometer cable and ground strap from the transmission.

8. Matchmark and remove the front and rear driveshaft from the transfer case.

9. Disconnect the clutch return spring.

10. Disconnect the clutch cable from the clutch fork.

11. Remove the flywheel cover.

12. Remove the transmission rear crossmember bolts.

13. Raise the engine/transmission assembly and remove the rear crossmember-to-frame bolts.

14. Remove the rear mounting bolts from the transfer case.

15. Remove the side case from the transmission.

16. Remove the stud bolt from the transfer case.

17. Lower the engine/transmission assembly and support the rear of the engine.

18. Disconnect the CRS switch and back-up light switch.

19. Remove the shifter cover and gasket from the transfer case.

20. Remove the transmission-to-engine bolts. When removing the transmission, turn the side case fitting face down and pull the case straight back until it is free of the clutch. Lower the front of the transmission and remove it.

21. To install, reverse the removal procedures.

1988-90

1. Disconnect the negative battery cable.

2. Remove the undercover, if equipped.

3. Remove the air cleaner (2.3L engine) or air cleaner duct and hose (2.6L engine). Using a clean shop cloth, cover the air cleaner port to prevent dirt from entering the engine.

4. Label and disconnect the necessary hoses and electrical connectors.

5. Remove the clutch return spring, the clutch control cable, the back-up light switch connector and the speedometer cable from the transmission.

6. Remove the gear shift lever by performing the following procedures:

a. Place the gear shift lever in N.

b. Remove the front console from the floor panel.

c. Pull the shift lever boot and grommet upward.

d. Remove the shift lever cover bolts and the shift lever.

7. Remove the transfer shift lever by performing the following procedures:

a. Place the transfer shift lever in H (except 2.8L engine) or 2H (2.8L engine).

b. Pull the shift lever boot and dust cover upward.

c. Remove the shift lever retaining bolts.

d. Pull the shift lever from the transfer case.

8. Raise and safely support the vehicle with jackstands at the front and rear of the vehicle. Remove the front wheels.

9. Drain the transmission and transfer case fluid.

10. If equipped with a 1-piece driveshaft, remove the driveshaft flange-to-pinion nuts, lower the driveshaft and pull it from the transmission.

11. If equipped with a 2-piece driveshaft, perform the following procedures:

a. Remove the rear driveshaft flange-to-pinion nuts.

b. Remove the rear driveshaft flange-to-front driveshaft flange bolts and the rear driveshaft.

c. Remove the center bearing-to-chassis bolts, move the front driveshaft rearward and from the transmission.

12. Remove the front driveshaft's splined yoke flange-to-transfer case bolts and separate the front driveshaft from the transfer case; do not allow the splined flange to fall away from the driveshaft.

13. Remove the starter-to-engine bolts and the starter.

14. If equipped with a clutch slave cylinder, remove it from the transmission and move it aside.

15. Remove the exhaust pipe-to-exhaust manifold nuts, the exhaust pipe bracket-to-transmission bolts, the front exhaust pipe-to-2nd exhaust pipe bolts and the front exhaust pipe from the vehicle.

16. Attach an engine hanger to the rear of the exhaust manifold.

17. Using an engine hoist, connect it to the engine hangers and support the engine.

18. If equipped with a 2.8L engine, remove the catalytic converter and the parking brake cable bracket.

19. Using a transmission jack, place it under the transmission and support the assembly.

20. Remove the rear mount-to-transmission nuts.

21. Remove the rear mount-to-side mount member nuts/bolts and the mount.

22. Remove the transmission-to-engine bolts.

23. Move the transmission assembly rearward.

24. Carefully lower the transmission. **To install:**

25. Raise the transmission into position.

26. Move the transmission forward and engage it with the engine.

27. Install the engine-to-transmission bolts.

28. Install the rear mount and the rear mount-to-side mount member nuts/bolts.

29. Install the rear mount-to-transmission nuts.

30. Remove the transmission jack.

31. If equipped with a 2.8L engine, install the catalytic converter and the parking brake cable bracket.

32. Remove the engine hoist and the engine hanger from the rear of the exhaust manifold.

33. Install the front exhaust pipe, exhaust pipe-to-exhaust manifold nuts, the exhaust pipe bracket-to-transmission bolts, the front exhaust pipe-to-2nd exhaust pipe bolts.

34. If equipped with a clutch slave cylinder, install it onto the transmission.

35. Install the starter and the starter-to-engine bolts.

36. Install the front driveshaft's splined yoke flange-to-transfer case bolts.

37. If equipped with a 2-piece driveshaft, perform the following procedures:

a. Install the front driveshaft into the transmission and the center bearing-to-chassis bolts.

b. Install the rear driveshaft and the rear driveshaft flange-to-front driveshaft flange bolts.

c. Install the rear driveshaft flange-to-pinion nuts.

38. If equipped with a 1-piece driveshaft, install the driveshaft into the transmission and the driveshaft flange-to-pinion nuts.

39. Install the front wheels and lower the vehicle.

40. Install the transfer shift lever by performing the following procedures:

a. Position the shift lever into the transfer case.

b. Install the shift lever retaining bolts.

c. Push the dust cover and the shift lever boot downward.

41. Install the gear shift lever by performing the following procedures:

a. Install the shift lever and the shift lever cover bolts.

b. Push the grommet and shift lever boot downward.

c. Install the front console to the floor panel.

42. Install the clutch return spring, the clutch control cable, the back-up light switch connector and the speedometer cable to the transmission.

43. Connect the necessary hoses and electrical connectors.

44. Install the air cleaner (2.3L) or air cleaner duct and hose (2.6L).

45. Refill the transmission and the transfer case. Install the undercover, if equipped.

46. Install the negative battery cable.

LINKAGE ADJUSTMENT

No adjustments are possible on the transmission or transfer case linkage.

CLUTCH

Clutch Assembly

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.

2. On 2WD vehicles, remove the transmission. On 4WD models, remove the transmission and transfer case as an assembly.

3. Matchmark the clutch assembly to the flywheel so the clutch assembly can be reassembled in the same position.

4. Loosen the pressure plate-to-flywheel bolts, 1 turn at a time in an alternating sequence, until the spring tension is relieved to avoid distorting or bending the pressure plate.

5. Using a clutch alignment tool, support the pressure plate and cover assembly and remove the bolts and clutch assembly.

To install:

6. Apply a thin coat of grease to the pressure plate fingers, diaphragm

Exploded view of the clutch assembly

spring, clutch cover grooves and the drive bosses on the pressure plate.

7. Apply a thin coat of lubricant to the splines in the clutch disc.

8. Using a clutch alignment tool, assemble the clutch disc and pressure plate onto the flywheel.

9. Align the matchmarks and install the pressure plate-to-flywheel bolts and torque the bolts to 12–14 ft. lbs. Remove the aligning tool.

10. On 2WD vehicles, install the transmission. On 4WD models, install the transmission and transfer case as an assembly.

11. To complete the installation, reverse the removal procedures. Adjust the clutch cable linkage.

PEDAL HEIGHT ADJUSTMENT

The clutch pedal height is the distance from the center of the clutch pedal pad to the cowl.

1. Locate the clutch switch at the top of the clutch pedal under the dash.

2. Loosen the switch-to-clutch pedal bracket.

3. Adjust the clutch switch to obtain a clutch pedal height of 6.9–7.2 in. (P'UP with mechanical clutch), 7.4–7.8 in. (P'UP with hydraulic hydraulic), 7.28–7.68 in. (Pick-Up and Amigo) or 9.15–9.55 in. (Trooper/Trooper II).

4. After adjusting the pedal height, tighten the clutch switch adjusting nut.

Measuring the clutch pedal height

Clutch Cable

REMOVAL & INSTALLATION

1. Loosen the clutch cable lock and adjusting nuts. Remove the clutch cable clip in the engine compartment.

2. Raise and safely support the vehicle. Remove the spring from the shift fork end.

3. Disconnect the cable end from the shift fork and pull the cable assembly through the bracket.

4. Lower the vehicle enough to disengage the hooked part of the clutch pedal from the cable eye. Pull the cable assembly towards the engine compartment and remove the cable from the vehicle.

5. To install, reverse the removal procedures. Adjust the cable when finished.

ADJUSTMENT

1. Pull the outer cable, located under the hood, forward as far as possible and secure it.

2. Turn the adjusting nut inward it touches the damper rubber washer, located at the firewall.

3. Depress and release the clutch pedal 3 times.

4. Tighten the adjusting nut again.

View of the clutch cable adjustment

5. Pull the outer cable forward again and fully tighten the adjusting nut.

6. Loosen the nut to provide a 1/8 in. clearance between the adjusting nut and the damper washer.

7. Release the outer cable and tighten the locknut to secure the adjusting nut.

Clutch Master Cylinder

The clutch master cylinder is located on the firewall inside the engine compartment.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the hydraulic line from the clutch master cylinder.

2. Disconnect the master cylinder pushrod from the clutch pedal.

3. Remove the master cylinder-to-firewall nuts and remove the master cylinder.

4. To install, reverse the removal procedures. Torque the master cylinder-to-firewall nuts to 8–15 ft. lbs. (12–20 Nm).

5. Using new washers, torque the hydraulic line-to-master cylinder bolt to 22–29 ft. lbs. (30–39 Nm).

6. Bleed the hydraulic clutch system.

Clutch Slave Cylinder

The clutch slave cylinder is attached to the bell housing.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the hydraulic line from the clutch slave cylinder.

2. Remove the slave cylinder-to-bell housing bolts and remove the slave cylinder.

3. To install, reverse the removal procedures.

4. Using new washers, torque the hydraulic line-to-slave cylinder fitting to 11–17 ft. lbs. (16–25 Nm).

5. Bleed the hydraulic clutch system.

BLEEDING THE HYDRAULIC SYSTEM

1. Firmly, set the parking brake.

2. Check the reservoir fluid level and refill, if necessary.

3. At the slave cylinder, remove the rubber cap from the bleeder screw.

4. Using a vinyl tube, connect it to the bleeder screw and submerge the other end in a transparent container of brake fluid.

5. Have an assistant pump the clutch pedal several times and hold it.

6. Loosen the bleeder screw and allow the air bubble fluid to flow into the container, then, tighten the bleeder screw.

7. Release the clutch pedal.

8. Repeat this operation until the fluid is clear of air bubbles.

9. Refill the reservoir. Remove the vinyl tube and replace the rubber cap on the bleeder screw.

AUTOMATIC TRANSMISSION

Transmission Assembly

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Exploded view of the clutch cable assembly

REMOVAL & INSTALLATION

2wd Vehicles

1986-87

1. Disconnect the negative battery cable. Raise and safely support the vehicle.

2. Remove the undercover, if equipped.

3. Remove the transmission dipstick assembly. Drain the transmission fluid. Disconnect and plug the oil cooler lines from the transmission.

4. Remove the torque converter cover. Matchmark the torque converter-to-flywheel location and remove the torque converter-to-flywheel bolts; rotate the torque converter to expose the bolts.

5. Remove the exhaust pipe-to-exhaust manifold nuts and separate the pipe from the manifold.

6. Disconnect the shift lever control rod from the transmission shift lever.

7. Disconnect the back-up light switch and transmission wiring from the transmission.

8. Using an engine hoist, connect it to the engine hangers and support the engine.

9. Raise and safely support the vehicle.

10. Remove the starter motor. Disconnect the speedometer from the transmission.

Exploded view of the hydraulic system

11. Matchmark and remove the driveshaft. Remove the transmission-to-crossmember bolts.

12. Lift the engine/transmission slightly and remove the transmission frame bracket from the crossmember. Remove the rear mount from the crossmember. Remove the exhaust pipe bracket from the transmission.

13. Support the transmission.

14. Remove the bell housing-to-engine bolts and the transmission from the vehicle.

NOTE: Be careful that the torque converter does not drop from the transmission.

15. To install, reverse the removal procedures. Refill the transmission and check the transmission operation.

1988-90

1. Disconnect the negative battery cable.

2. Remove the undercover, if equipped.

3. Label and disconnect the necessary hoses and electrical connectors.

4. Remove the back-up light switch connector and the speedometer cable from the transmission.

5. Remove the gear shift lever by performing the following procedures:

a. Place the gear shift lever in N.

b. Remove the front console from the floor panel.

c. Pull the shift lever boot and grommet upward.

d. Remove the shift lever cover bolts and the shift lever.

6. Raise and safely support the vehicle. Remove the front wheels.

7. Drain the transmission fluid.

8. Remove the oil level gauge and the tube.

9. Disconnect the shift select control link rod from the select lever.

10. Disconnect the downshift cable from the transmission.

11. Disconnect and plug the fluid coolant lines from the transmission.

12. If equipped with a 1-piece driveshaft, remove the driveshaft flange-to-pinion nuts, lower the driveshaft and pull it from the transmission.

13. If equipped with a 2-piece driveshaft, perform the following procedures:

a. Remove the rear driveshaft flange-to-pinion nuts.

b. Remove the rear driveshaft flange-to-front driveshaft flange bolts and the rear driveshaft.

c. Remove the center bearing-to-chassis bolts, move the front driveshaft rearward and from the transmission.

14. Remove the starter-to-engine bolts and the starter.

15. Remove the exhaust pipe-to-exhaust manifold nuts, the exhaust pipe

bracket-to-transmission bolts, the front exhaust pipe-to-2nd exhaust pipe bolts and the front exhaust pipe from the vehicle.

16. Attach an engine hanger to the rear of the exhaust manifold.

17. Using an engine hoist, connect it to the engine hangers and support the engine.

NOTE: Removal of the transmission will require an assistant.

18. Remove the torque converter-to-flex plate bolts through the starter hole.

19. Using a transmission jack, place it under the transmission; do not support it.

20. Remove the rear mount-to-transmission nuts.

21. Remove the rear mount-to-crossmember nuts/bolts and the mount.

22. Remove the transmission-to-engine bolts.

23. Move the transmission rearward into the crossmember and floor pan area; the transmission may rest on the crossmember.

24. Lower the front of the transmission toward the jack.

25. Firmly, grasp the transmission the rear cover while the assistant raises the jack toward the transmission.

26. Carefully, lower the transmission onto the jack and center it.

27. Lower the jack and move the transmission rearward.

To install:

NOTE: Installation of the transmission will require an assistant.

28. Raise the transmission into position.

29. Raise the rear of the transmission and move it into position on the crossmember.

30. Move the transmission forward and engage it with the engine.

31. Install the engine-to-transmission bolts.

32. Install the mount and the rear mount-to-crossmember nuts/bolts.

33. Install the rear mount-to-transmission nuts.

34. Install the torque converter-to-flex plate bolts through the starter hole.

35. Remove the engine hoist and the engine hanger from the rear of the exhaust manifold.

36. Install the front exhaust pipe, exhaust pipe-to-exhaust manifold nuts, the exhaust pipe bracket-to-transmission bolts, the front exhaust pipe-to-2nd exhaust pipe bolts.

37. Install the starter and the starter-to-engine bolts.

38. If equipped with a 2-piece driveshaft, perform the following procedures:

a. Install the front driveshaft into the transmission and the center bearing-to-chassis bolts.

b. Install the rear driveshaft and the rear driveshaft flange-to-front driveshaft flange bolts.

c. Install the rear driveshaft flange-to-pinion nuts.

39. If equipped with a 1-piece driveshaft, install the driveshaft into the transmission and the driveshaft flange-to-pinion nuts.

40. Connect the fluid coolant lines to the transmission.

41. Connect the downshift cable to the transmission.

42. Connect the shift select control link rod to the select lever.

43. Install the oil level gauge and the tube.

44. Install the front wheels and lower the vehicle.

45. Install the gear shift lever by performing the following procedures:

a. Install the shift lever and the shift lever cover bolts.

b. Push the grommet and shift lever boot downward.

c. Install the front console to the floor panel.

46. Install the back-up light switch connector and the speedometer cable to the transmission.

47. Connect the necessary hoses and electrical connectors.

48. Refill the transmission. Install the undercover, if equipped.

49. Connect the negative battery cable.

50. Start the engine, check for leaks.

4wd Vehicles

1988-90

1. Disconnect the negative battery cable.

2. Remove the undercover, if equipped.

3. Remove the air cleaner (2.3L engine) or air cleaner duct and hose (2.6L engine). Using a clean shop cloth, cover the air cleaner port to prevent dirt from entering the engine.

4. Label and disconnect the necessary hoses and electrical connectors.

5. Remove the back-up light switch connector and the speedometer cable from the transmission.

6. Remove the gear shift lever by performing the following procedures:

a. Place the gear shift lever in N.

b. Remove the front console from the floor panel.

c. Pull the shift lever boot and grommet upward.

d. Remove the shift lever cover bolts and the shift lever.

7. Remove the transfer shift lever by performing the following procedures:

a. Place the transfer shift lever in **H** (except 2.8L engine) or **2H** (2.8L engine).

b. Pull the shift lever boot and dust cover upward.

c. Remove the shift lever retaining bolts.

d. Pull the shift lever from the transfer case.

8. Raise and safely support the vehicle with jackstands at the front and rear of the vehicle. Remove the front wheels.

9. Drain the transmission and transfer case fluid.

10. Remove the oil level gauge and the tube.

11. Disconnect the shift select control link rod from the select lever.

12. Disconnect the downshift cable from the transmission.

13. Disconnect and plug the fluid coolant lines from the transmission.

14. If equipped with a 1-piece driveshaft, remove the driveshaft flange-to-pinion nuts, lower the driveshaft and pull it from the transmission.

15. If equipped with a 2-piece driveshaft, perform the following procedures:

a. Remove the rear driveshaft flange-to-pinion nuts.

b. Remove the rear driveshaft flange-to-front driveshaft flange bolts and the rear driveshaft.

c. Remove the center bearing-to-chassis bolts, move the front driveshaft rearward and from the transmission.

16. Remove the front driveshaft's splined yoke flange-to-transfer case bolts and separate the front driveshaft from the transfer case; do not allow the splined flange to fall away from the driveshaft.

17. Remove the starter-to-engine bolts and the starter.

18. Remove the exhaust pipe-to-exhaust manifold nuts, the exhaust pipe bracket-to-transmission bolts, the front exhaust pipe-to-2nd exhaust pipe bolts and the front exhaust pipe from the vehicle.

19. Attach an engine hanger to the rear of the exhaust manifold.

20. Using an engine hoist, connect it to the engine hangers and support the engine.

21. If equipped with a 2.8L engine, remove the catalytic converter and the parking brake cable bracket.

22. Using a transmission jack, place it under the transmission and support the assembly.

23. Remove the rear mount-to-transmission nuts.

24. Remove the rear mount-to-side mount member nuts/bolts and the

mount.

25. Remove the transmission-to-engine bolts.

26. Move the transmission assembly rearward.

27. Carefully lower the transmission.

To install:

28. Raise the transmission into position.

29. Move the transmission forward and engage it with the engine.

30. Install the engine-to-transmission bolts.

31. Install the rear mount and the rear mount-to-side mount member nuts/bolts.

32. Install the rear mount-to-transmission nuts.

33. Remove the transmission jack.

34. If equipped with a 2.8L engine, install the catalytic converter and the parking brake cable bracket.

35. Remove the engine hoist and the engine hanger from the rear of the exhaust manifold.

36. Install the front exhaust pipe, exhaust pipe-to-exhaust manifold nuts, the exhaust pipe bracket-to-transmission bolts, the front exhaust pipe-to-2nd exhaust pipe bolts.

37. Install the starter and the starter-to-engine bolts.

38. Install the front driveshaft's splined yoke flange-to-transfer case bolts.

39. If equipped with a 2-piece driveshaft, perform the following procedures:

a. Install the front driveshaft into the transmission and the center bearing-to-chassis bolts.

b. Install the rear driveshaft and the rear driveshaft flange-to-front driveshaft flange bolts.

c. Install the rear driveshaft flange-to-pinion nuts.

40. If equipped with a 1-piece driveshaft, install the driveshaft into the transmission and the driveshaft flange-to-pinion nuts.

41. Connect the fluid coolant lines to the transmission.

42. Connect the downshift cable to the transmission.

43. Connect the shift select control link rod to the select lever.

44. Install the oil level gauge and the tube.

45. Install the front wheels and lower the vehicle.

46. Install the transfer shift lever by performing the following procedures:

a. Position the shift lever into the transfer case.

b. Install the shift lever retaining bolts.

c. Push the dust cover and the shift lever boot downward.

47. Install the gear shift lever by performing the following procedures:

a. Install the shift lever and the

shift lever cover bolts.

b. Push the grommet and shift lever boot downward.

c. Install the front console to the floor panel.

48. Install the back-up light switch connector and the speedometer cable to the transmission.

49. Connect the necessary hoses and electrical connectors.

50. Install the air cleaner (2.3L) or air cleaner duct and hose (2.6L).

51. Refill the transmission and the transfer case. Install the undercover, if equipped.

52. Install the negative battery cable.

SHIFT LINKAGE ADJUSTMENT

1986-87

1. Loosen the control rod locknuts so the trunnion will slide on the control rod.

2. Turn the manual shaft on the transmission fully clockwise, viewed from the left side of the transmission, then, back it off to the 3rd stop and set it in the **N** position.

3. While holding the shaft in this position, move the shift lever to the **N** position.

4. Push the shift shift, with the shift control lower lever rearward to remove play and tighten the adjusting nuts.

5. Road test the vehicle and check for proper operation of the transmission in all ranges.

1988-90

1. Loosen the shift linkage adjusting nut.

2. Push the shift lever fully rearward.

3. Return the shift lever 2 notches to the **N** position.

4. While holding the selector lever lightly toward the **R** range side, tighten the shift linkage nut.

Adjusting the automatic transmission shift linkage - 1986-87

THROTTLE LINKAGE ADJUSTMENT

Gasoline Engine

1986-87

1. Loosen the throttle valve control cable adjusting nuts.
2. Check that the carburetor throttle adjusting screw is in contact with the stopper for normal idling.

NOTE: If the adjusting screw is not resting on the stopper, the fast idle mechanism is working and setting of the adjusting screw should be adjusted to obtain normal idling.

3. To obtain normal idling, perform the following procedures:
 - a. Disconnect the battery ground cable.
 - b. Remove the air cleaner cover.
 - c. Fully depress the accelerator pedal to place the choke in the wide open position and release the pedal; do not depress the pedal again.
 - d. Check the the throttle adjusting screw is in contact with the stopper.
 - e. Install the air cleaner.
 - f. Connect the battery cable.

4. Remove the rubber boot from the outer cable and turn the adjusting nuts to adjust the outer cable setting to 0.032-0.059 in. (0.8-1.5mm) and tighten the adjusting nuts; the setting is the distance between the outer cable end and the inner cable stopper.

Adjusting the automatic transmission shift linkage—1988-90

5. After adjusting, check that the inner cable stroke, from the closed position of the throttle valve to the wide open position is 1.30-1.36 in. (32.9-33.9mm).

6. Install the rubber boot onto the outer cable.

1988-90

1. Depress the accelerator pedal all the way and check that the throttle valve opens fully.

Location the throttle adjusting screw—1987-88 gasoline engine

WHEN THROTTLE VALVE IS FULLY CLOSED

View of the throttle cable adjustment—1987-88 gasoline engine

View of the throttle cable adjustment—1988-90 gasoline engine

NOTE: If the valve does not open fully, adjust the accelerator link.

2. Fully depress the accelerator.
3. Loosen the adjustment nuts.
4. Adjust the cable housing so the distance between the end of the boot and stopper on the cable is the 0.03-0.06 in. (0.8-1.5mm).
5. Tighten the adjusting nuts.
6. Recheck the adjustment.

Diesel Engine

1. Loosen the throttle valve control cable adjusting nuts.
2. Fully depress the accelerator pedal to place the injection pump lever in contact with the maximum speed adjusting screw and hold the lever in that position.

NOTE: If the injection pump lever is not in contact with the adjusting screw, adjust the accelerator linkage.

3. Turn the outer cable adjusting nuts to adjust the outer cable setting to 0.032-0.059 in. (0.8-1.5mm) and tighten the adjusting nuts; the setting is the distance between the upper face of the rubber boot, on the end of the outer cable, and the inner cable stopper.

4. After adjusting, check that the inner cable stroke, from the normal idling position the maximum speed position is 1.30-1.36 in. (32.9-33.9mm).

NOTE: Normal idling position can not be obtained with the air conditioner operating and the engine coolant temperature higher than 59°F (15°C).

View of the injection pump maximum speed adjusting screw—diesel engine

WHEN THROTTLE VALVE IS FULLY CLOSED

View of the throttle cable adjustment—diesel

NEUTRAL SAFETY SWITCH ADJUSTMENT

This adjustment is necessary only if the engine will start with the shift selector in any range except N or P.

1. Loosen the neutral start switch bolt and set the shift selector into the N range.
2. Align the groove and the neutral basic line.
3. Hold it in position and torque the bolt to 9 ft. lbs.

View of the neutral start switch

TRANSFER CASE

Transfer Case Assembly

REMOVAL & INSTALLATION

The transfer case is an integral part of the transmission housing. Although the 2 cases can be separated, the transfer case should be removed with the transmission. The transfer case linkage is not adjustable.

DRIVE AXLE

Driveshaft and U- Joints

REMOVAL & INSTALLATION

2wd Driveshaft

1. Raise and support the vehicle safely.

2. Matchmark the driveshaft to the yokes.
3. Remove the driveshaft retaining bolts and remove the driveshaft.
4. To install, reverse the removal procedures.

4wd Driveshaft

REAR

1. Raise and safely support the vehicle.
2. Matchmark the driveshaft flange-to-differential pinion flange.
3. If equipped with a 1-piece driveshaft, remove the driveshaft flange-to-pinion nuts, lower the driveshaft and pull it from the transmission.
4. If equipped with a 2-piece driveshaft, perform the following procedures:
 - a. Remove the rear driveshaft flange-to-pinion nuts.
 - b. Remove the rear driveshaft flange-to-front driveshaft flange bolts and the rear driveshaft.
 - c. Remove the center bearing-to-chassis bolts, move the front driveshaft rearward and from the transmission.

To install:

5. If equipped with a 2-piece drive-

shaft, perform the following procedures:

- a. Install the front driveshaft into the transmission and the center bearing-to-chassis bolts.
- b. Install the rear driveshaft and the rear driveshaft flange-to-front driveshaft flange bolts.
- c. Install the rear driveshaft flange-to-pinion nuts.
6. If equipped with a 1-piece driveshaft, install the driveshaft into the transmission and the driveshaft flange-to-pinion nuts.
7. To complete the installation, reverse the removal procedures.

FRONT

1. Raise and safely support the vehicle.
2. Matchmark the driveshaft flange-to-transfer case flange and the driveshaft-to-differential pinion flange.
3. Remove the front driveshaft's splined yoke flange-to-transfer case bolts and separate the front driveshaft from the transfer case; do not allow the splined flange to fall away from the driveshaft.
4. Remove the driveshaft flange-to-differential pinion flange bolts and

1. Differential side bolt
2. Flange bolt
3. 2nd propeller shaft assembly
4. Center bearing bracket bolt
5. 1st propeller shaft assembly

Exploded view of the rear driveshaft assembly—1986-87 similar

separate the driveshaft from the front differential.

5. To install, align the matchmarks and reverse the removal procedures.

View of the front driveshaft—4WD

U-Joints

1. Raise and support the vehicle safely. Remove the driveshaft.

2. If the front yoke is to be disassembled, matchmark the driveshaft and sliding splined yoke so that drive-line balance is preserved upon reassembly. Remove the snaprings that retain the bearing caps.

3. Select 2 press components, with 1 small enough to pass through the yoke holes for the bearing caps and the other large enough to receive the bearing cap.

4. Use a vise or a press and position the small and large press components on either side of the U-joint. Press in on the smaller press component so it presses the opposite bearing cap out of the yoke and into the larger press component. If the cap does not come all the way out, grasp it with a pair of pliers and work it out.

5. Reverse the position of the press components so that the smaller press component presses on the cross. Press the other bearing cap out of the yoke.

6. Repeat the procedure on the other bearings.

7. To install, grease the bearing caps and needles thoroughly if they are not pregreased. Start a new bearing cap into a side of the yoke. Position the cross in the yoke.

NOTE: Some U-joints have a grease fitting that must be installed in the joint before assembly. When installing the fitting, make sure that once the driveshaft is installed in the vehicle that the fitting is accessible to be greased at a later date.

8. Select 2 press components small enough to pass through the yoke holes. Put the press components against the cross and the cap and press the bearing cap 1/4 in. below the surface of the yoke. If there is a sudden increase in the force needed to press the cap into place, or if the cross starts to bind, the bearings are cocked. They

must be removed and restarted in the yoke. Failure to do so will cause premature bearing failure.

9. Install a new snapring.

10. Start the new bearing into the opposite side. Place a press component on it and press in until the opposite bearing contacts the snapring.

11. Install a new snapring. It may be necessary to grind the facing surface of the snapring slightly to permit easier installation.

12. Install the other bearings in the same manner.

13. Check the joint for free movement. If binding exists, smack the yoke ears with a brass or plastic faced hammer to seat the bearing needles. If binding still exists, disassemble the joint and check to see if the needles are in place. Do not strike the bearings unless the shaft is supported firmly. Do not install the driveshaft until free movement exists at all joints.

Front Axle Shaft, Bearing and Seal

REMOVAL & INSTALLATION

Axle Shaft

1. Raise and safely support the vehicle.

2. Disconnect the front driveshaft from the differential.

3. Remove the wheels and skid plate.

4. Loosen the torsion bar completely with the height control adjusting bolts.

5. Remove the strut bars.

6. Disconnect the stabilizer bars from the lower control arms.

7. Remove the caliper assemblies and wire them to the frame; do not disconnect the brake lines.

8. Remove the ball joints from the tie rods.

9. Disconnect the upper control arms from the frame; make sure to note the number and positions of the shims.

10. Remove the steering link ends from the lower control arms.

11. Disconnect the shock absorbers from the lower control arms.

12. Disconnect the lower control arms from the frame.

13. Remove the locking hub.

14. Remove the rotors and upper links.

15. Remove the pitman arm and idler arm along with the steering linkage assembly.

16. Support the differential housing and lower it clear of the vehicle. Take care to avoid damaging the Birfield joints.

17. Drain the differential case and

remove the 4 bolts attaching the axle mounting bracket to the case.

18. Pull the shaft assemblies from the case on both sides.

19. To install, reverse the removal procedures.

20. Check the level of the axle lubricant and bleed the brake system when finished.

Axle Shaft Seal

1. Raise and safely support the vehicle. Remove the wheel assembly.

2. Remove the axle from the housing.

3. Remove the seal from the housing.

4. Clean and inspect the sealing surfaces of the housing and axle.

5. Using a seal installer tool, drive the new seal into the housing with the lip of the seal facing the housing.

6. Lightly coat the lip of the seal with oil and install the axle in the housing.

7. To complete the installation, reverse the removal procedures.

8. Check the level of the axle lubricant when finished.

Axle Shaft Bearings

1. Raise and safely support the vehicle.

2. Remove the axle shaft from the housing.

3. Support the axle shaft and remove the bearing retainer locknut and washer.

4. Remove the retainer, bearing and seal from the axle shaft.

5. To install, reverse the removal procedures.

6. Always replace the seal and lock washer when removing the axle shaft from the housing. Torque the bearing retainer nut to 188–195 ft. lbs.

Wheel Bearings

1. Place the transfer case in 2H. Raise and safely support the vehicle.

2. Remove the free wheeling hub cover assembly.

3. Remove the snapring and shims from the spindle.

4. Remove the free wheeling hub body and lock washer.

5. Remove the outer roller bearing assembly from the hub with a finger.

6. Using a brass or wood drift, drive out the inner bearing assembly along with the oil seal. Replace the seal.

7. Wash all parts in a non-flammable solvent.

8. Check all parts for cracks or wear. Thoroughly lubricate all bearing parts with a high-temperature wheel bearing grease. Remove any excess. Apply about 2 ounces of the grease to the hub.

Exploded view of the front axle assembly—4WD

To install:

9. Lightly coat the spindle with the same grease.

10. Place the inner bearing into the hub race and install a new seal and retaining ring.

11. Carefully install the hub on the spindle and install the outer bearing.

12. Install the spindle nut.

13. While rotating the hub, tighten the hub so the wheel can just be turned by hand.

14. Turn the hub 2-3 turns and back off the nut just enough so it can be loosened with the fingers.

15. Finger-tighten the nut so all play is taken up at the bearing.

16. Attach a pull scale to a lug nut and check the amount of pull needed to start the wheel turning. Initial pull should be 2.6-4.0 lbs. When performing this test, make sure the brake pads are not touching the rotor. If the rotating torque is not correct, tighten the spindle nut until it is.

17. Install the snapping and shims, gasket and cover. Torque the cover bolts to 14 ft. lbs.

Rear Axle Shaft, Bearing and Seal

REMOVAL & INSTALLATION Axle Shaft

1. Raise and safely support the vehicle.

2. Remove the rear wheel assembly and brake drum.

3. Remove the 4 axle retainer bolts.

4. Using a slide hammer on the axle, pull the axle out of the housing.

5. To install, reverse the removal procedures.

6. Torque the axle retainer bolts to 51-58 ft. lbs.

Pinion Seal

1. Raise and safely support the vehicle.

2. Matchmark and remove the driveshaft.

3. Check the turning torque of the pinion before proceeding. This is the torque that must be reached during installation of the pinion nut.

NOTE: The amount of turning torque required to move the pinion gear should be 20-30 ft. lbs of torque.

4. Using a pinion flange holding tool, remove the pinion nut and washer.

5. Remove the pinion flange from the pinion gear.

6. Pry the pinion seal out of the differential carrier.

7. Clean and inspect the sealing surface of the carrier.

To install:

8. Using a seal driver tool, drive the new seal into the carrier until the flange on the seal is flush with the carrier.

9. With the seal installed, the pinion bearing preload must be set.

10. Tighten the pinion nut while holding the flange, until the turning torque is the same as before removal of the nut.

11. Align the matchmarks and install the driveshaft.

12. Check the level of the differential lubricant when finished.

Axle Shaft Seal

1. Raise and safely support the vehicle.
2. Remove the axle shaft from the housing.
3. Support the axle shaft and remove the bearing retainer locknut.
4. Remove the retainer, bearing and seal from the axle shaft.
5. Using a seal driver tool, remove the seal and install the new seal in the retainer.
6. To install, reverse the removal procedures.
7. Torque the bearing retainer nut to 188–195 ft. lbs.
8. Check the level of the axle lubricant when finished.

Front Wheel Hub, Knuckle and Bearings REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the wheel assembly.
2. Remove the brake caliper and support it on a wire. Remove the rotor and dust shield.
3. If equipped with 4WD, remove the axle shaft from the hub.
4. Remove the tie rod end-to-steering knuckle nut and separate the tie rod from the steering knuckle.
5. Support the lower control arm and separate the steering knuckle from the lower ball joint.
6. Separate the steering knuckle from the upper ball joint.
7. Remove the steering knuckle from the vehicle.
8. To install, reverse the removal procedures.
9. Torque the ball joint nuts to 75 ft. lbs.

Manual Locking Hubs REMOVAL & INSTALLATION

1. Place the transfer case in the 2H position. Raise and safely support the vehicle.
2. Set the hubs in the FREE position.
3. Remove the hub cover bolts and the hub cover.
4. While pushing the follower toward the knob, turn the clutch assembly clockwise and then remove the clutch assembly from the knob.
5. Remove the snapping and the knob from the cover. Do not loose the detent ball.
6. Remove the ball and spring from the knob.
7. Remove the X-ring from the knob by pressing it off.

NOTE: Do not use a sharp instrument to remove this ring because it may scratch the ring.

1. Differential carrier and case assembly
2. Mounting bolt
3. Gasket
4. Drain plug
5. Filler plug
6. Vent
7. Through bolt
8. Oil seal
9. Shims
10. Locknut

Exploded view of the rear axle assembly

8. Remove the compression spring, retaining spring and the follower from the clutch assembly.
9. Remove the retaining spring from the clutch assembly by turning it counterclockwise.
10. Remove the snapping and the inner assembly from the body.
11. Separate the ring, inner and spacer by removing the snapping.
12. To install, reverse the removal procedures. Apply grease to the X-ring, the inner cover and the outside circumference of the knob.

Automatic Locking Hubs REMOVAL & INSTALLATION

1. Move the transfer case shift lever into 2H and move the vehicle forward and rearward about 3 ft.
2. Remove the hub cap-to-housing bolts and the cap.
3. Loosen the wheel nuts
4. Raise and safely support the vehicle. Remove the front wheel(s).
5. Remove the brake caliper-to-steering knuckle bolts and support the caliper on a wire; do not disconnect the brake hose.
6. Using snapping pliers, remove the snapping and shims.
7. Remove the drive clutch assembly, the inner cam and lockwasher.
8. Using a hub nut wrench, loosen the hub nut.
9. Pull the hub from the spindle.
10. If necessary, use a brass drift and a hammer to drive the wheel bearings from the hub.
11. If removing the disc from the hub, scribe matchmarks, remove the disc-to-hub bolts and separate the disc from the hub.

To install:

12. To install, reverse the removal procedures.
13. When installing the hub nut, perform the following procedures:
 - a. Torque the hub nut to 22 ft. lbs. and loosen the nut.
 - b. Using a spring gauge, connect it to the stud bolt at 90 degrees.
 - c. Retorque the hub nut until the spring gauge measures a bearing preload of 4.4–5.5 lbs. (new bearing and oil seal) or 2.6–4.0 lbs. (used bearing and new oil seal).
14. Adjust the snapping clearance by performing the following procedures:
 - a. Install the special adjusting tool onto the hub until it comes in contact with the lock washer.
 - b. Using a feeler gauge, measure the clearance *t* between the hub and the snapping groove on the axle shaft.
 - c. If the clearance is larger than the snapping groove, install shims on the shaft so clearance *t* is 0–0.039 in. (0–0.1mm).
15. To complete the installation, reverse the removal procedures. Apply Loctite® to the hub cap bolts and torque the hub cap-to-hub assembly bolts to 43 ft. lbs. (60 Nm).

Pinion Seal

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. If necessary, remove the skid plate.
2. Matchmark and remove the front driveshaft.
3. Check the turning torque of the pinion before proceeding. This is the

torque that must be reached during installation of the pinion nut.

NOTE: The amount of turning torque required to move the pinion gear should be 20–30 ft. lbs of torque.

4. Using a pinion flange holding tool, remove the pinion nut and washer.

5. Remove the pinion flange from the pinion gear.

6. Pry the pinion seal out of the differential carrier.

7. Clean and inspect the sealing surface of the carrier.

To install:

8. Using a seal driver tool, drive the new seal into the carrier until the flange on the seal is flush with the carrier.

9. With the seal installed, the pinion bearing preload must be set.

10. Tighten the pinion nut while holding the flange, until the turning torque is the same as before removal of the nut.

11. Align the matchmarks and install the driveshaft.

12. Check the level of the differential lubricant when finished.

Differential Carrier

REMOVAL & INSTALLATION

Front Drive Axle

1. Raise and safely support the vehicle.

2. Drain the differential oil.

3. Matchmark and remove the front driveshaft.

4. Remove the axle shafts from the differential.

5. Remove the differential carrier mounting bolts and remove the carrier.

To install:

6. To install, reverse the removal procedures. Use a new gasket when installing.

7. Fill the differential to the correct level when finished.

Rear Drive Axle

1. Raise and safely support the vehicle.

2. Drain the differential oil.

3. Matchmark and remove the rear driveshaft.

4. Remove the axle shafts from the differential.

5. Remove the differential carrier mounting bolts and the carrier.

To install:

6. To install, reverse the removal procedures. Use a new gasket when installing.

7. Fill the differential to the correct level when finished.

Axle Housing

REMOVAL & INSTALLATION

Front Housing

1. Raise and safely support the vehicle.

2. Matchmark and disconnect the front driveshaft from the differential.

3. Remove the wheels and skid plate.

4. Loosen the torsion bar completely with the height control adjusting bolts.

5. Remove the strut bars.

6. Disconnect the stabilizer bars from the lower control arms.

7. Remove the caliper assemblies and suspend them on a wire; do not disconnect the brake lines.

8. Remove the tie rod ends from the steering knuckles.

9. Disconnect the upper control arms from the frame; note the number and positions of the shims.

10. Remove the steering link ends from the lower control arms.

11. Disconnect the shock absorbers from the lower control arms.

12. Disconnect the lower control arms from the frame.

13. Remove the locking hub.

14. Remove the rotors and upper links.

15. Remove the pitman arm and idler arm along with the steering linkage assembly.

16. Support the differential housing and lower it clear of the vehicle. Take care to avoid damaging the Birfield joints.

17. To install, reverse the removal procedures. Check the level of the axle lubricant when finished.

Rear Housing

1. Raise and safely support the vehicle. Remove the rear wheels.

2. Disconnect the shock absorbers from the spring plates.

3. Disconnect and plug the brake lines on the rear axle housing.

4. Disconnect the parking brake cables from the rear axle housing.

5. Support the rear axle housing and remove the housing to leaf spring U-bolts.

6. Remove the rear axle housing from the vehicle.

To install:

7. To install, reverse the removal procedures.

8. Torque the housing U-bolts to 36–43 ft. lbs. and the shock absorber bolts to 27–30 ft. lbs.

9. Bleed the brake system and check the level of the axle lubricant when finished.

STEERING

Steering Wheel

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. From the rear of the steering wheel, remove the horn pad screw. Pry the horn pad upward from the steering wheel.

3. Remove the steering wheel-to-steering column nut.

4. Matchmark the steering wheel-to-steering shaft.

5. Using a steering wheel puller, press the steering wheel from the steering shaft.

6. To install, align the matchmarks and reverse the removal procedures. Torque the steering wheel nut to 18–25 ft. lbs. for 1986–87 or 22–29 ft. lbs. (30–39 Nm) for 1988–90.

Manual Steering Gear

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and safely support the vehicle. Remove the skid plate, if equipped.

2. Remove pitman arm nut and washer. Matchmark the pitman arm-to-pitman shaft.

3. Using a puller tool, press the pitman arm from the pitman shaft.

4. Remove the steering gear-to-steering shaft clamp bolt.

5. Remove the steering gear-to-frame bolts and the steering gear from vehicle.

To install:

6. Place the steering gear in position and install and tighten the mounting bolts.

7. Install the steering gear-to-steering shaft clamp bolt and torque to 29–40 ft. lbs. (40–49 Nm).

Exploded view of the steering column assembly—1986–87

3. Turn the adjusting screw clock-

Exploded view of the steering column assembly — 1988-90

wise to decrease the free-play or counterclockwise to increase it.

4. With the steering wheel free-play set at 0.4 in. (10mm), torque the lock-nut to 26-35 ft. lbs. (37-47 Nm).

Power Steering Pump

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Disconnect and plug the inlet and outlet fluid lines from the power steering pump.
3. Remove the drive belt from the pump.
4. Remove the pump-to-bracket bolts and the pump from the brackets.
5. To install, reverse the removal procedures.
6. Connect the negative battery cable. Refill and bleed the power steering system.

BELT ADJUSTMENT

1. Loosen the power steering pump adjusting bolts.

2. Using finger pressure, between the idler pulley and the power steering pump pulley, check the belt deflection; it should be 0.4 in. (10mm).

3. With the power steering pump adjusted to the correct belt deflection, tighten the pump bolts.

SYSTEM BLEEDING

1. Fill the power steering reservoir to the proper level when cold.
2. Start and operate the engine until it reaches normal operating temperatures.
3. Turn the engine **OFF** and check the fluid level. If necessary, fill the reservoir to the proper level.
4. Run the engine and turn the steering wheel from lock-to-lock, in both directions, 3-4 times; do not hold the steering wheel at the lock position for more than 5 seconds or temperature rise will result.
5. Return the steering wheel to center, turn the engine **OFF** and allow the fluid to sit for 5 minutes before adding any more.
6. If necessary, repeat the bleeding procedure until the air bubbles are removed from the system.

7. Fill the system to the proper level when finished.

Tie Rod Ends

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
 2. Matchmark the tie rod ends to the tie rod shaft for reinstallation purposes.
 3. Remove the cotter pin and nut from the tie rod end and loosen the clamping bolts on the sleeve.
 4. Using a tie rod end puller, separate the tie rod from the steering knuckle.
 5. Unscrew the tie rod while counting the number of turns required to remove it.
 6. Check the tie rod end for damage and replace it, if necessary.
- To install:**
7. Install the tie rod end in the sleeve the same number of turns as when removing it.
 8. Install the tie rod end in the steering knuckle. Install the nut and new cotter pin.
 9. Check the toe in when finished.

Exploded view of the steering linkage assembly

Intermediate Rod and Tie Rods

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Remove cotter pin from the ball studs connecting tie rods-to-intermediate rod and the steering damper. Remove the castellated nuts. Using a ball joint separator tool, separate the parts.

3. Remove the nut and lockwasher on ball stud connecting the intermediate rod to idler arm. Using a ball joint separator tool, separate the intermediate rod from the idler arm.

4. Remove the intermediate rod with tie rods.

5. If the tie rod is replaced, disconnect the intermediate rod from tie rod.
To install:

6. Make sure the threads on the ball studs and nuts are clean and smooth.

7. Install the intermediate rod-to-idler arm and torque the nut to 50 ft. lbs.

8. Raise the end of the rod and install it on the pitman arm. Torque the nut to 44 ft. lbs. Tighten the nut just

enough to insert cotter pin and install new cotter pin.

9. Install intermediate rod to steering damper end. Torque nut to 87 ft. lbs., then, advance nut just enough to insert cotter pin and install new cotter pin.

10. Install the tie rods to adapter, torque nut to 44 ft. lbs., then, advance nut just enough to insert cotter pin and install new cotter pin and lubricate tie rod ball studs.

BRAKES

For all brake system repair and service procedures not detailed below, please refer to "Brakes" in the Unit Repair section.

Master Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Firmly, set the parking brake and block the wheels.

2. Disconnect and plug the brake lines from the master cylinder.

NOTE: Be careful not to spill any brake fluid on any painted surface. Brake fluid acts exactly like paint remover.

3. Remove the master cylinder-to-power brake unit nuts.

4. Remove the master cylinder from the booster.

5. Bleed the master cylinder before installing.

6. Install the master cylinder onto the booster.

7. Connect the fluid lines, refill the master cylinder with the proper brake fluid and bleed the brake system.

BLEEDING

1. To bleed the brakes, first carefully clean all dirt from around the master cylinder filler cap.

2. If a bleeder tank is used, follow the manufacturer's instructions.

3. Remove the filler cap and fill the master cylinder to the lower edge of the filler neck.

4. Clean off the bleeder connections at all of the wheel cylinders or disc brake calipers. Attach the bleeder hose and fixture to the right rear wheel cylinder bleeder screw and place the end of the tube in a glass jar, submerged in brake fluid.

5. Open the bleeder valve $\frac{1}{2}$ – $\frac{3}{4}$ of a turn. Have an assistant depress the brake pedal and allow the pedal to return slowly. Continue this pumping action to force any air out of the system.

6. When bubbles cease to appear at the end of the bleeder hose, close the bleeder valve and remove the hose. Check the level of the brake fluid in the master cylinder and add fluid, if necessary.

7. After the bleeding operation at each caliper or wheel cylinder has been completed, refill the master cylinder reservoir and replace the filler plug.

NOTE: Never reuse brake fluid which has been removed from the lines through the bleeding process because it contains air bubbles and dirt.

Proportioning Valve

The proportioning valve is located directly under the master cylinder.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Firmly, set the parking brake and block the wheels.

2. Disconnect the electrical connector from the proportioning valve.

3. Disconnect and plug the fluid lines from the proportioning valve.

4. Remove the proportioning valve-to-chassis bolts and the valve.

5. To install, reverse the removal procedures.

6. Bleed the brake system.

Power Brake Booster

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Firmly, set the parking brake and block the wheels.

2. Disconnect the vacuum hose to the vacuum booster.

3. Disconnect and plug the brake fluid lines at the master cylinder. Place rags under the master cylinder to catch any leaking fluid.

NOTE: Be careful not to spill any brake fluid on any painted surface. Brake fluid acts exactly like paint remover.

4. Inside the vehicle, remove the snapping from the clevis pin and separate the clevis pin from the brake pedal.

5. Remove the vacuum booster mounting nuts at the firewall and lift out the power unit and master cylinder/reservoir as an assembly.

To install:

6. To install, reverse the removal procedures. Check the distance from

View of the power booster pushrod adjustment

the flange face of the vacuum booster to the end of the push-rod before installation of the master cylinder.

7. The distance should be 0.709–0.717 in. If the measurement deviates from the specified range, make an adjustment with the locknut at the end of the pushrod.

8. Bleed the brake system when finished.

Brake Caliper

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the wheel assembly.

2. Disconnect and plug the brake fluid line from the caliper.

3. Remove the brake caliper mounting bolts and the caliper from the mount.

4. Remove the brake pads and clips from the caliper. Inspect the brake pads for wear; replace them, if necessary.

To install:

5. Fill the brake caliper with brake fluid and connect the fluid line to the caliper. Install the brake pads and clips onto the caliper.

6. Install the caliper on the mounting bracket.

7. Install the wheel assembly. Bleed the brake system and lower the vehicle.

Disc Brake Pads

REMOVAL & INSTALLATION

Front

1. Raise and safely support the vehicle. Remove the wheel assembly.

2. Remove the brake caliper mounting bolts and remove the caliper without disconnecting the brake fluid line. Support the caliper so it does not hang on the brake line.

3. Remove the brake pads and retaining clips from the caliper.

4. Using a C-clamp, press the brake caliper piston into the caliper until it bottoms out.

To install:

5. Install the new brake pads and clips in the caliper and install the caliper in the mounting bracket.

6. Install the wheel assembly. Check the brake fluid level.

7. Pump the brake pedal until pressure is felt before moving the vehicle.

1. Brake flexible hose
2. Lock bolt
3. Pad assembly with shim
4. Pad clip
5. Caliper assembly
6. Support bracket
7. Front hub and disc assembly

Exploded view of the front disc brake assembly

Exploded view of the rear disc brake assembly

Exploded view of the rear brake drum/shoe assembly

Rear

1. Raise and safely support the vehicle. Remove the wheel assembly.
2. Remove the brake caliper mounting bolts and remove the caliper without disconnecting the brake fluid line. Support the caliper so it does not hang on the brake line.
3. Remove the brake pads and retaining clips from the caliper.
4. Turn the adjusting screw to retract the caliper piston to its lowest position.

To install:

5. Install the new brake pads and clips in the caliper and install the caliper in the mounting bracket.
6. Install the wheel assembly. Check the brake fluid level.
7. Pump the brake pedal until pressure is felt before moving the vehicle.

Brake Rotor

REMOVAL & INSTALLATION

Front

1. Raise and safely support the vehicle. Remove the wheel assembly.
2. Remove the brake caliper without disconnecting the fluid line. Support the caliper out of the way.
3. Remove the brake caliper from the mounting bracket.
4. Remove the dust cover, cotter pin and locknut from the rotor.
5. Place a hand over the outer wheel bearing in the rotor and remove the rotor from the spindle.
6. To install, reverse the removal procedures.
7. Adjust the wheel bearings.

Rear

1. Raise and safely support the vehicle. Remove the wheel assembly.
2. Remove the brake caliper without disconnecting the fluid line. Support the caliper out of the way.
3. Remove the brake caliper from the mounting bracket.
4. Remove the rotor from the axle shaft.
5. To install, reverse the removal procedures.

Brake Drums

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. Remove the wheel and the brake drum.
3. To install, reverse the removal procedures.

Brake Shoes

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the tire and wheel assembly.
2. Remove the brake drum.
3. Remove the return springs, the hold-down springs and lift the brake shoe assembly from the backing plate.
4. Disconnect the parking brake cable from the adjuster.

5. To install, reverse the removal procedures.

Wheel Cylinder

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the wheel assembly, brake drums and shoes.
2. Disconnect and plug the brake line at the wheel cylinder.
3. Remove the wheel cylinder-to-backing plate bolts and the cylinder.
4. Cap the openings of the brake line and the wheel cylinder.
5. To install, reverse the removal procedures. Bleed the brake system.

Parking Brake Cable

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. Loosen the cable adjusting nut and remove the lever return spring. Remove the adjusting nut.
3. Remove the cotter pin from the retaining pin on the 2nd lever assembly and remove the front cable.
4. Remove the 2 cotter pins from the retaining pins on the intermediate cable and remove the cable.
5. Remove the retaining clips from the rear fixing brackets and lower the rear brake cables.

Exploded view of the parking brake cable assembly

6. Remove the rear wheel assemblies and brake drums. Remove the rear brake shoes and disconnect the rear brake cables from the lever in the rear brake shoes.

7. To install, reverse the removal procedures. Adjust the cables when finished.

ADJUSTMENT

NOTE: Adjustment of the parking brake is necessary every time the rear brake cables are disconnected or after overhauling the rear brake assembly.

1. Fully, release the parking brake lever and check the cable for free movement.

2. Firmly, grab the 2nd relay lever rod. Rotate the adjusting nut until all the slack is removed from the cable. Tighten the adjusting nut.

3. Apply the parking brake to the fully set position 3-4 times.

4. If the parking brake is properly adjusted, the traveling range should be between 12-14 notches. If the travel is incorrect, readjust to specifications.

FRONT SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

2wd Vehicles

1. Raise and support the vehicle safely.

2. Hold the upper stem of the shock absorber from turning and remove the upper stem retaining nut, retainer and rubber grommet.

3. Remove the bolt retaining the lower shock absorber pivot to the low-

er control arm and remove the shock absorber from the vehicle.

To install:

4. Install the shock absorber by first installing the lower retainer and rubber grommet over the upper stem and then, installing the shock fully extended up through the upper control arm so the upper stem passes through the mounting hole in the frame bracket.

5. Install the upper rubber grommet, retainer and attaching nut over the shock absorber upper stem.

6. Hold the upper stem of the shock absorber from turning and tighten the retaining nut.

7. Install the retainers attaching the shock absorber lower pivot to the lower control arm and tighten them.

8. Lower the vehicle.

4wd Vehicles

1. Raise and safely support the vehicle.

1. Adjust bolt, seat, lock plate and bolt
2. Height control arm
3. Torsion bar
4. Nut and washer
5. Rubber bushing and washer
6. Bolt and washer
7. Strut bar
8. Rubber bushing, washer and tube
9. Bolt
10. Bracket
11. Nut
12. Rubber bushing and washer
13. Rubber bushing and washer
14. Bracket
15. Bolt and nut
16. Rubber bushing and washer
17. Stabilizer bar
18. Nut
19. Rubber bushing and washer
20. Bolt, nut and washer
21. Shock absorber
22. Rubber bushing and washer
23. Lower link bumper
24. Upper link bumper

Exploded view of the front suspension—2WD

2. Hold the upper stem of the shock absorber from turning and remove the upper stem retaining nut, retainer and rubber grommet.

3. Remove the bolt retaining the lower shock absorber pivot to the lower control arm and remove the shock absorber from the vehicle.

To install:

4. Install the shock absorber by first installing the lower retainer and rubber grommet over the upper stem and then, installing the shock fully extended up through the upper control arm so the upper stem passes through the mounting hole in the frame bracket.

5. Install the upper rubber grommet, retainer and attaching nut over the shock absorber upper stem.

6. Hold the upper stem of the shock absorber from turning and tighten the retaining nut.

7. Install the retainers attaching the shock absorber lower pivot to the lower control arm and tighten them.

8. Lower the vehicle.

Torsion Bars

REMOVAL & INSTALLATION

2wd Vehicles

1. Raise and safely support the vehicle.

2. Remove the adjusting bolt from the height control arm.

3. Mark the location and remove the height control arm from the torsion bar and the third crossmember.

4. Mark the location and withdraw the torsion bar from the lower control arm.

To install:

5. To install, apply a generous

amount of grease to the serrated ends of the torsion bar.

6. Hold the rubber bumpers in contact with the lower control arm. Raise the vehicle up under the lower control arm to accomplish this.

7. Insert the front end of the torsion bar into the control arm.

8. Install the height control arm in position so it's end is reaching the adjusting bolt. Be sure to lubricate the part of the height control arm that fits into the chassis with grease.

9. Install a new cotter pin in the control arm.

10. Turn the adjusting bolt to the location marked before removal.

11. Lower the vehicle and check the vehicle height.

4wd Vehicles

1. Raise and safely support the vehicle.

Exploded view of the front suspension—4WD

2. Remove the adjusting bolt from the height control arm.

3. Mark the location and remove the height control arm from the torsion bar and the 3rd crossmember.

4. Mark the location and withdraw the torsion bar from the lower control arm.

To install:

5. To install, apply a generous amount of grease to the serrated ends of the torsion bar.

6. Hold the rubber bumpers in contact with the lower control arm. Raise the vehicle up under the lower control arm to accomplish this.

7. Insert the front end of the torsion bar into the control arm.

8. Install the height control arm in position so it's end is reaching the adjusting bolt. Be sure to lubricate the part of the height control arm that fits into the chassis with grease.

9. Install a new cotter pin in the control arm.

10. Turn the adjusting bolt to the location marked before removal.

11. Lower the vehicle and check the vehicle height.

Upper Ball Joints

INSPECTION

Grasp the top of the front wheel and pull it in and out several times to check for excessive movement of the ball joint; if no movement exist, the joint is in good shape.

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the wheel and tire assembly.

2. Remove the tension from the torsion bar.

3. Remove the upper ball joint-to-steering knuckle nut.

4. Using a ball joint separator tool, separate the upper ball joint from the steering knuckle.

5. Remove the upper ball joint-to-upper control arm bolts and the ball joint.

6. To install, reverse the removal procedures. Torque the upper ball joint-to-upper control arm bolts to 21-25 ft. lbs. (29-35 Nm) and the upper ball joint-to-steering knuckle nut to 72-87 ft. lbs. (96-117 Nm) for 2WD or to 65-80 ft. lbs. (88-108 Nm) for 4WD.

7. Adjust the tension on the torsion bar and lower the vehicle.

Lower Ball Joints

INSPECTION

1. Raise and safely support the

front of the vehicle.

2. Using a large pry bar, place it under the front wheel and try to pry the wheel upwards.

3. If excessive upward movement or clunking is noticed, the ball joint is damaged and requires replacement.

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Remove the wheel and tire assembly.

3. Release the torsion bar tension.

4. Remove the cotter pin and castellated nut which retains the ball joint to the steering knuckle.

5. Remove the lower ball joint-to-lower control arm and strut rod.

6. Remove the ball joint.

To install:

7. Install the lower ball joint by mounting the joint to the lower control arm and torque the bolts to 45-56 ft. lbs. (61-76 Nm) for 2WD or to 68-83 ft. lbs. (93-113 Nm) for 4WD.

8. Install the ball joint stud into the steering knuckle and install the castellated nut and torque it to 101-116 ft. lbs. (137-157 Nm) for 2WD or to 87-111 ft. lbs. (117-137 Nm) for 4WD and just enough additional torque to align the cotter pin hole with a castellation on the nut. Install a new cotter pin.

9. Lubricate the lower ball joint through the grease fitting.

10. Adjust the torsion bar tension.

11. Install the wheel assembly and lower the vehicle.

Upper Control Arms

REMOVAL & INSTALLATION

NOTE: The upper control arm and ball joint are replaced as an assembly.

1. Raise and safely support the vehicle on the lower control arms.

2. Remove the wheel and tire assembly.

3. Remove the cotter pin nut fastening the upper control arm and upper ball joint assembly and disconnect the upper control arm from the steering knuckle.

NOTE: Do not allow the steering knuckle to hang by the flexible brake line. Wire the steering knuckle up to the frame temporarily.

4. Remove the bolts from the upper pivot shaft and remove the upper control arm from the bracket. Be sure to note the position and number of shims used for adjusting the camber and caster angles when removing the upper control arm. The shims must be

replaced in their original position.

5. To remove the pivot shaft and bushings from the upper control arm assembly, remove the bushing nuts from the pivot shaft by loosening them alternately, then remove the pivot shaft.

To install:

6. To install the upper control arm and ball joint assembly, first install the pivot shaft boots to the pivot shaft.

7. Fill the internal part of the bushings with grease and screw the bushings into the pivot shaft. Be sure to screw the right-side and the left-side bushings alternately into the pivot shafts carefully avoiding getting grease on the outer face of the bushings. Tighten the nuts to 250 ft. lbs.

NOTE: Be sure that the control arm and bushings are centered properly and that the control arm rotates with resistance but not binding on the pivot shaft when tightened to the proper torque.

To install:

8. Install the grease fittings and lubricate the parts with grease through the grease fittings.

9. Install the ball joint stud through the steering knuckle. Install the castellated nut and tighten it to 75 ft. lbs. and just enough additional torque to install the cotter pin. Use a new cotter pin.

10. Mount the upper control arm to the chassis frame and install the shims in their original positions between the pivot shaft and bracket. Tighten the pivot shaft attaching nuts to 55 ft. lbs.

NOTE: Tighten the thinner shim pack's nut first for improved shaft-to-frame clamping force and torque retention.

11. Install the dust cover.

12. Install the wheel assembly and lower the vehicle.

Lower Control Arms

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Remove the wheel and tire assembly.

3. Remove the strut bar by removing the frame side bracket and the double nuts, washer and the rubber bushing from the front side of the strut bar. Remove the strut bar-to-lower control arm bolts and remove the bar.

4. Disconnect the stabilizer bar from the lower control arm.

Exploded view of the steering knuckle and control arm assembly—2WD

5. Remove the torsion bar.
6. Disconnect the shock absorber from the lower control arm.

7. Remove the lower ball joint from the lower control arm joint.

8. Remove the retaining nut and drive out the bolt holding the lower control arm to the chassis with a soft metal drift. Remove the lower control arm from the vehicle.

To install:

9. To install the lower control arm, install the lower ball joint to the lower control arm. Tighten the retaining nuts to 45 ft. lbs.

10. Mount the lower control arm to the frame. Drive the bolt into position carefully. Use care not to damage the serrated portions. Tighten the nut on the end of the pivot bolt to 135 ft. lbs.

11. Install the stabilizer bar to the lower control arm.

12. Place the washers and bushings on the strut rod and install it through the frame bracket. Install the second set of washers and bushings on the strut rod together with the lockwashers and nut. Leave the nut loose temporarily.

13. Install the strut rod to the lower control arm and tighten the bolts to 45 ft. lbs.

14. Assemble the lower ball joint to the steering knuckle.

15. Install the wheel assembly and lower the vehicle.

16. Tighten the 1st strut bar-to-chassis frame attaching nut to 175 ft. lbs. and the 2nd locknut to 55 ft. lbs. with the vehicle on the ground.

Front Wheel Bearings—2WD

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the wheel assembly. Remove the hub assembly.

2. Remove the outer roller bearing assembly from the hub. Pry out the inner bearing lip seal and remove the inner bearing assembly.

3. Wash all parts in a cleaning solvent and dry with compressed air.

4. Check the bearings for pitting or scoring. Also check for smooth rotation and lack of noise.

Exploded view of the steering knuckle and control arm assembly—4WD

To install:

5. Thoroughly lubricate the bearings with new wheel bearing lubricant.
6. Apply a light coat of lubricant to the spindle and inside surface of the hub.
7. Place the inner bearing in the race of the hub and install a new grease seal.
8. Install the hub assembly on the spindle.
9. Install the outer wheel bearing, washer and adjust nut.
10. Adjust the wheel bearings.
11. Install the dust cap on the hub.
12. Install the brake caliper and support assembly.
13. Install the wheel assembly.

Adjustment

1. With the wheel raised, remove

the hub cap and dust cap and then remove the cotter pin and nut retainer from the end of the spindle.

2. While rotating the wheel, tighten the spindle nut to 22 ft. lbs.

3. Turn the hub 2-3 turns and loosen the nut just enough so it can be turned by hand.

4. Turn the nut all the way hand tight and check to be sure the hub has no freeplay.

5. Measure the starting torque by pulling a wheel hub stud with a pull scale. Tighten the spindle nut so the pull scale reads 1.1-2.6 lbs. when the hub begins to rotate.

NOTE: Make sure the brake pads are not in contact with the drum when measuring rotating torque.

6. Install the nut retainer, new cotter pin, dust cap and hub cap.

REAR SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. Remove the shock absorber-to-lower mount nut, washers and bushings.

3. Remove the shock absorber-to-chassis nut, washers and bushings.
4. Remove the shock absorber.
5. To install, reverse the removal procedures.

Leaf Springs

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle so the leaf springs are hanging freely.
2. Remove the rear shock absorbers.
3. Remove the parking brake cable clips.
4. Remove the nuts from the U-bolts holding the springs to the axle housing.

5. Support the rear axle housing to remove the weight of the axle housing from the springs.
6. Remove the front and rear shackle pin nuts.
7. Drive out the rear shackle pin by using a hammer and drift. Lower the rear end of the leaf spring assembly to the floor.
8. Drive out the front shackle pin and remove the leaf spring assembly rearward.
9. Remove the shackle pin from the rear spring bracket and remove the shackle.
10. Check the leaf springs for cracks, wear and broken leaves. Replace any leaves found to be cracked, broken, fatigued or seriously worn.
11. Check the shackles for bending and the pins for wear.

12. Check the U-bolts for distortion or other damage.

To install:

13. Mount the shackle to the bracket.
14. Align the front end of the leaf spring assembly with the front bracket and install the shackle pin.
15. Align the rear end of the leaf spring assembly with the shackle and install the shackle pin.
16. Loosely install the shackle pin nuts and install the U-bolts. Tighten the U-bolt nuts to 40 ft. lbs.
17. Install the shock absorbers.
18. Clip the parking brake cable to the bracket.
19. Remove the axle housing support and lower the vehicle so the weight is on the leaf springs.
20. Tighten the shackle pin nuts to 130 ft. lbs.

1. Rubber bumper
2. Bushing
3. Leaf spring assembly
4. Spring pin, bolt and washer

5. Nut and washer
6. Rubber bushing
7. Rubber bushing
8. Shackle
9. Shackle plate
10. Nut and washer

11. Nut and washer
12. Lower clamp
13. U-bolt and nut
14. Shock absorber
15. Nut and washer
16. Nut and washer

FIRING ORDERS

NOTE: To avoid confusion, always replace the spark plug wires one at a time.

1998cc and 2184cc engines
Firing order: 1-3-4-2
Distributor rotation: clockwise

2555cc and 2606cc engines
Firing order: 1-3-4-2
Distributor rotation: clockwise

2954cc engine
Firing order: 1-2-3-4-5-6
Distributor rotation: clockwise

ENGINE ELECTRICAL

NOTE: Disconnecting the battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is disconnected.

Distributor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the distributor cap without removing the spark plug wires from the cap.

2. Disconnect the vacuum hose from the distributor.

3. Remove the rubber plug from the timing belt cover. Scribe matchmarks on the distributor body and the engine to indicate their positions.

4. Scribe another mark on the distributor body indicating the position of the rotor. On 1998cc engines, scribe a mark on the cam pulley and on the indicator inside the timing belt cover to mark the position of the pulley relative to the indicator.

5. Disconnect and tag the primary wires from the distributor.

6. Remove the distributor locknut and washers.

7. Remove the distributor from the engine.

To install:

8. Align the matchmarks made during the removal.

9. Install the distributor with the rotor pointing in the same direction as when removed.

10. Align the distributor body to engine matchmarks. Install the locknut and washer.

11. Connect the wires and vacuum hose to the distributor. Install the distributor cap.

12. Start the engine and adjust the ignition timing.

13. With the timing correct, tighten the locknut and recheck the timing.

14. If the engine was disturbed while the distributor was removed:

1. Cap
2. Rotor
3. Gasket
4. Signal rotor and pin
5. Pickup coil and lighter
6. Vacuum control unit
7. Breaker
8. Pickup coil for G-rotor

Distributor assembly—2954cc engine shown, others similar

a. Rotate the crankshaft until No. 1 cylinder is at TDC. This can be determined by removing the No. 1 spark plug, placing a finger over the spark plug hole while turning the engine and feeling for compression.

b. Continue rotating the engine, until the TDC mark on the crank-

shaft pulley is aligned with the timing pointer.

c. Install the distributor into the engine with the rotor pointing to the No.1 plug on the distributor cap.

d. Install the distributor locknut, start the engine and correct the ignition timing.

Timing mark location—1998cc and 2184cc engines

Ignition Timing

ADJUSTMENT

1. Before starting the engine, clean and mark the timing marks.

2. Disconnect and plug the vacuum line at the distributor.

3. Connect a timing light and tachometer to the engine according to their manufacturer's instructions.

4. Start the engine and adjust the idle to the correct rpm.

5. With the engine running, point the timing light at the timing marks and observe the reading.

NOTE: All 4 cylinder engines have 2 timing marks. Looking straight down on the marks from the front, the mark on the left is TDC and the mark on the right is BTDC.

6. Adjust the timing if necessary, by loosening the distributor lock bolt and rotating the distributor. When the proper ignition timing is obtained, tighten the lock bolt on the distributor and recheck the timing.

7. Check the centrifugal advance mechanism by accelerating the engine to 2,000 rpm and making sure that the timing advances.

8. Reset the idle to specifications. Connect the distributor vacuum hose.

9. Stop the engine and remove the tachometer and timing light.

Alternator

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Disconnect and tag the alternator wiring.
3. Remove the alternator adjusting bolt.
4. Remove the drive belt.
5. Support the alternator, remove the pivot bolt, and remove the alternator.
6. Before installing the alternator, tighten the alternator mount to engine bolts.
7. Installation is the reverse of the removal procedure.
8. Reconnect the alternator wiring and negative battery cable. Adjust the belt tension.

BELT TENSION ADJUSTMENT

The belt tension is adjusted at the adjusting bolt. Loosen the alternator mounting bolt and turn the adjusting belt to achieve the correct tension. The belt tension can be checked using the deflection method.

The correct deflection should be 0.28–0.32 in. (7–8mm) on the 1998cc,

Timing mark location—2555cc, 2606cc and 2954cc engines

2184cc, 2555cc and 2606cc for a new belt, 0.32–0.36 in (8–9mm) for a used belt. The deflection for the 2954cc engine should be, 0.17–0.20 in. (4.4–5mm) for a new belt and 0.20–0.22 in. (5–6mm) for a used belt.

Starter

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the air cleaner and air intake tube.

3. Disconnect the positive battery cable from the starter solenoid.

4. Remove the ignition switch wire from the solenoid terminal.

5. Raise and support the vehicle safely.

6. Support the starter and remove the starter mounting bolts and nuts.

7. Tilt the drive end of the starter downwards and remove the starter.

8. Installation is the reverse of the removal procedure.

9. Torque the starter mounting bolts to 23–34 ft. lbs., except on the 2954cc engine. Tighten the mounting bolts on the 2954cc engine to 27–38 ft. lbs.

Accessory drive belt routing—4 cylinder engine

Accessory drive belt routing—6 cylinder engine

Heater Blower Motor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the passenger side lower instrument panel cover.
3. Disconnect the blower wiring.
4. Remove the blower motor mounting nuts and remove the blower motor.
5. Installation is the reverse of the removal procedure.

Blower motor assembly—exploded view

Windshield Wiper Motor

REMOVAL & INSTALLATION

Except MPV

1. Disconnect the negative battery cable. Remove the wiper arm/blade assembly.
2. Remove the rubber seal from the leading edge of the cowl.
3. Unbolt and remove the cowl.
4. Remove the access hole covers.
5. Remove the bolts holding the wiper shaft drives.
6. Matchmark the position of the wiper crank arm in relation to the face

of the wiper motor. Disconnect the wiper linkage from the wiper motor crank arm.

7. Remove the wiper linkage.
8. Unbolt and remove the wiper motor. Disconnect the wiring harness.
9. Installation is the reverse of removal. Make sure that the parked height of the wiper arms, measured from the blade tips to the windshield moulding is 0.787 in. (20mm). Torque the arm retaining nuts to 8–10 ft. lbs.

MPV

1. Disconnect the negative battery cable. Remove the wiper arms.
2. Remove the drive link nuts from the top of the cowl.

3. Working under the hood, disconnect the negative battery cable.

4. Remove the motor and linkage mounting bolts and lift out the assembly.

5. After removal, separate the linkage from the motor.

6. Installation is the reverse of removal. When installing the wiper arms, make sure that the at rest position leaves a gap of 30mm between the blade tips and the lower windshield moulding.

Instrument Cluster

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Reach behind the cluster and disconnect the speedometer cable.
3. Remove the screws attaching the

Instrument cluster removal—MPV shown, others similar

Radio and trim removal—typical

cluster hood and carefully lift the hood off.

4. Remove the screw attaching the cluster pod to the dash panel and pull the pod outwards gradually. Reach behind the pod and disconnect the wiring connectors.

5. Remove the trip meter knob and on clusters with a tachometer, the clock adjust knob.

6. Remove the screws retaining the lens cover and lift off the cover.

7. Remove the screws retaining the cluster bezel and lift off the bezel.

8. Lift out the warning light plate.

9. Remove any gauges at this time.

10. Installation is the reverse of the removal procedure.

Radio

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the trim plate from around the radio.

3. Remove the radio mounting screws and slide it from the instrument panel.

4. Disconnect the wiring from the radio and remove it from the vehicle.

5. Installation is the reverse of removal.

Combination Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Matchmark and remove the steering wheel.

3. Remove the steering column shroud.

4. Disconnect and tag the electrical

Combination switch—exploded view

connectors at the base of the steering column.

5. Pull the headlight switch knob off the shaft.

6. Remove the snapping which retains the switch on the steering shaft. Pull the turn signal canceling cam off the shaft.

7. Remove the switch mounting bolt at the bottom of the switch. Remove the switch from the steering column.

8. Installation is the reverse of removal. Check the operation of the switch before installing the steering wheel.

Ignition Lock

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Matchmark and remove the steering wheel.

3. Remove the steering column cover.

4. Disconnect and tag the multiple connectors at the base of the combination switch.

5. Remove the switch retaining snapping. Pull the turn signal indicator cancelling cam off the shaft.

6. Remove the switch retaining bolt and remove the switch from the steering column.

NOTE: Make a groove on the head of the bolts attaching the steering lock body to the column shaft using the proper tool.

7. Remove the ignition lock attaching bolts. Remove the ignition lock.

8. Install and tighten the ignition lock bolts until the heads of the bolts break off.

9. The remainder of the installation is the reverse of the removal procedure.

Ignition Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the steering column covers.

3. Disconnect the wiring harness connector at the switch.

4. Remove the switch mounting screws and remove the switch.

5. Installation is the reverse of the removal procedure.

Stoplight Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the electrical connector from the stoplight switch.

3. Remove the switch retaining locknuts and pull the switch from the brake pedal bracket.

4. Install the switch in position and install the locknuts and connector.

5. Adjust the switch by turning it until it contacts the top of the brake pedal arm. Tighten the locknuts.

Fuses and Circuit Breakers

LOCATION

Except MPV

The fuse box is located under the drivers side of the instrument panel, it

contains all of the fuses and circuit breakers for the vehicle's electrical systems. There is also a small fuse box under the hood, on the right fender well. This box contains the main vehicle fuses (2 fuses).

MPV

The fuse box is located under the driver's side of the instrument panel, it contains all of the fuses for the vehicle's electrical systems. There is also a small fuse box under the hood, on the left fender well. This box contains the circuit breakers for the vehicle electrical systems.

ENGINE COOLING

Radiator

REMOVAL & INSTALLATION

Except MPV

1. Disconnect the negative battery cable. Drain the cooling system.
2. If equipped, remove the fan shroud.
3. Remove the fan. Don't lay the fan, if equipped with a fan clutch, on

its side. Fluid will be lost and the fan clutch will have to be replaced.

4. Disconnect the upper and lower radiator hoses.

5. Disconnect the coolant reservoir hose.

6. On vehicles with automatic transmission, disconnect and plug the cooler lines.

7. Unbolt and remove the radiator.

To install:

8. Install the radiator against the supports and tighten the mounting bolts.

9. Install the hoses on the radiator. Tighten the clamps.

10. Install the fan.

Heater and defroster assembly—exploded view

11. If equipped, install the fan shroud.

12. Refill the cooling system with the specified amount and type of coolant. Run the engine and check for leaks.

MPV

1. Disconnect the negative battery cable. Drain the cooling system.

2. Remove the fresh air duct.

3. Disconnect the upper and lower radiator hoses.

4. Disconnect the coolant reservoir hose.

5. On vehicles with automatic transmission, disconnect and plug the cooler lines.

6. Remove the fan shroud.

7. Remove the fan. Don't lay the fan, if equipped with a fan clutch, on its side. Fluid will be lost and the fan clutch will have to be replaced.

8. Unbolt and remove the radiator.

To install:

9. Install the radiator against the supports and tighten the mounting bolts.

10. Install the hoses and cooler lines on the radiator. Tighten the clamps.

11. Install the fan.

12. Install the fan shroud.

13. Refill the cooling system with the specified amount and type of coolant. Run the engine and check for leaks.

Heater Core

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Remove the water valve shield at the left side of the heater.

4. Disconnect the 2 hoses from the left side of the heater.

5. At the heater-defroster door, at the water valve and at the outside recirculation door, disengage the control cable housing from the mounting clip on the heater. Disconnect each of the 3 cable wires from the crank arms.

6. Disconnect the fan motor electrical lead.

7. Working inside the engine compartment, remove the 2 retaining nuts and the single bolt and washer which hold the heater to the firewall. A retaining bolt inside the passenger compartment must also be removed.

8. Disconnect the 2 defroster ducts from the heater and remove the heater.

9. With the heater assembly removed, remove the 5 screws and separate the halves of the heater assembly. To replace the heater core, loosen the hose clamps and slide the heater core from the case.

10. To replace the blower motor,

loosen the fan retaining nut. Lightly tap on the nut to loosen the fan. Remove the fan and nut from the motor shaft.

11. Remove the 3 motor-to-case retaining screws and disconnect the bullet connector to the resistor and ground screw.

12. Rotate the motor and remove it from the case.

To install:

13. Install the motor in the case, rotating it slightly.

14. Install the retaining screws and connect the bullet connector and ground wire.

15. Install the fan on the shaft and install the nut.

16. Assemble the halves together and install the 5 retaining screws.

17. Install the heater on the dash so that the heater duct indexes with the air intake duct and the 2 mounting studs enter their respective holes.

18. From the engine side of the firewall, install the nuts on the mounting studs. Install the mounting bolt.

19. Connect the defroster ducts.

20. Connect the heat-defrost door control cable to the door crank arm. Set the control lever (upper) in the **HEAT** position and turn the crank arm toward the mounting clip as far as it will go. Engage the cable housing in the clip and install the screw in the clip.

21. Connect the water valve control cable wire to the crank arm on the water valve lever. Locate the cable housing in the mounting clip. Set the control lever in the **HOT** position and pull the valve plunger and lever to the full outward position. This will move the lever crank arm toward the cable mounting clip as far as it will go. Tighten the clip and screw.

22. Insert the outside-recirculation door control cable into the hole in the door crank arm. Bend the wire over and tighten the screw. Set the center control lever in the **REC** position and turn the door crank arm toward the mounting clip as far as it will go. Engage the cable housing in the clip and install the screw in the clip.

23. Connect the fan motor electrical lead.

24. Connect the 2 hoses to the heater core tubes, at the left side of the heater and tighten the clamp.

25. Install the water valve shield and tighten the 3 screws on the left side of the heater.

26. Refill the cooling system and connect the negative battery cable.

27. Run the engine and check for leaks. Check the operation of the heater.

Water Pump

REMOVAL & INSTALLATION

1998cc and 2184cc Engines

1. Disconnect the negative battery cable. Drain the cooling system.

2. Remove the distributor. Remove the fan shroud, fan blades, pulley, hub and bracket.

NOTE: Always store the fan clutch in an upright position after removal to avoid fluid loss.

3. Remove the alternator. Disconnect the air injection pipes.

4. Remove the drive belts.

5. Remove the crankshaft pulley and baffle plate.

6. Remove the upper and lower timing belt covers.

7. Rotate the crankshaft so that the **A** mark on the camshaft pulley is at the top, aligned with the notch in the front housing.

8. Loosen the tensioner lock bolt and remove the tensioner spring.

9. Mark the direction of rotation of the timing belt for installation. Remove the belt.

10. Remove the water inlet pipe and gasket from the water pump.

11. Remove the water pump mounting bolts and remove the water pump.

To install:

12. Use a new O-ring coated with clean coolant and a new gasket coated with sealer. Torque the water pump mounting bolts to 14–19 ft. lbs.

13. Install the coolant inlet pipe, using a new gasket coated with sealer.

14. Replace the timing belt if it has been contaminated by oil or grease, or shows any sign of damage, wear, cracks or peeling.

15. To ease installation of the belt, remove all the spark plugs.

16. Make sure that the timing mark on the camshaft is aligned and that the timing mark on the crankshaft sprocket is aligned with the triangular shaped mark on the front housing.

17. Install the tensioner and spring. Position the tensioner all the way to the intake manifold side and temporarily secure it there with the lock bolt.

18. Install the belt onto the sprockets from the right side. If the original belt is being reused, follow the directional mark previously made.

19. Loosen the lock bolt so that the tensioner applies tension to the belt.

20. Turn the crankshaft 2 full revolutions in the direction of normal rotation. This will apply equal tension to all points of the timing belt.

26. Make sure that the timing marks are still aligned. If not, repeat the tim-

Water pump mounting—1998cc and 2184cc engines

ing belt installation procedure.

27. Tighten the timing belt tensioner lock bolt to 30–35 ft. lbs.

28. Measure the timing belt tension by pressing on the belt at the midpoint of the longest straight run. Belt deflection should be 11–13mm. If not, repeat the belt adjustment procedure.

29. The remainder of the installation is the reverse of removal procedure.

2555cc and 2606cc Engines

1. Disconnect the negative battery cable. Drain the cooling system.

2. Remove the water pump drive belt. Remove the cooling fan and belt pulley.

3. Remove the fan shroud. Remove the water bypass hose.

4. Disconnect the lower radiator hose at the water pump.

5. Remove the water pump mount-

ing bolts and remove the water pump.

6. Clean and inspect the water pump sealing surface of the engine.

To install:

7. Using a new gasket, install the water pump on the engine and torque the bolts to 14–19 ft. lbs.

8. Connect the lower radiator hose and water bypass hose.

9. Install the drive belt pulley, cooling fan and drive belt.

10. Adjust the drive belt tension. Install the fan shroud.

11. Fill the cooling system, run the engine and check for leaks.

2954cc Engine

1. Position the engine at TDC on the compression stroke.

2. Properly relieve the fuel system pressure.

3. Disconnect the negative battery

cable. Remove the air cleaner assembly.

4. Drain the cooling system. Remove the spark plug wires.

5. Remove the fresh air duct assembly. Remove the cooling fan and radiator cowl. Remove the accessory drive belts.

6. Remove the air conditioning compressor idler pulley. If necessary, remove the compressor and position it to the side.

7. Remove the crankshaft pulley and baffle plate. Remove the coolant bypass hose.

8. Remove the upper radiator hose.

9. Remove the timing belt cover assembly retaining bolts and remove the timing belt cover assembly and gasket.

10. Turn the crankshaft to align the mating marks of the pulleys.

11. Remove the upper idler pulley.

Water pump mounting—2555cc and 2606cc engines

Water pump mounting—2954cc engine

12. Remove the timing belt. If reusing the belt be sure to mark the direction of rotation. Remove the timing belt auto tensioner.

13. Unbolt and remove the water pump. Discard the gasket.

14. Thoroughly clean the mating surfaces of the pump and engine.

To install:

15. Position the pump and a new gasket, coated with sealer, on the engine. Torque the bolts to 19 ft. lbs.

16. Install the timing belt.

17. Install the timing belt cover assembly and new gasket. Install the timing belt cover assembly retaining bolts.

18. Install the upper radiator hose. Install the coolant bypass hose.

19. Install the crankshaft pulley and baffle plate. Install the compressor.

20. Install the air conditioning compressor idler pulley and install and adjust the drive belts.

21. Install the cooling fan and radiator cowl.

22. Install the fresh air duct assembly.

bly. Install the spark plug wires.

23. Fill the cooling system. Install the air cleaner assembly.

24. Connect the negative battery cable.

Thermostat

REMOVAL & INSTALLATION

Except MPV with 2954cc Engine

1. Disconnect the negative battery cable. Drain the cooling system down below the thermostat housing. Disconnect the coolant temperature sending unit wire.

2. Remove the coolant outlet elbow. If equipped, position the vacuum control valve out of the way. The vacuum control valve is not used on California vehicles.

3. Disconnect the coolant bypass hose from the thermostat housing.

4. Remove the thermostat and housing from the engine.

5. Note the position of the jiggle pin and remove the thermostat from the housing.

6. Clean and inspect the sealing surfaces of the housing and engine.

To install:

7. Position the thermostat in the housing with the jiggle pin up. Coat the new gasket with sealer and install it on the thermostat housing.

8. Install the thermostat housing using a new gasket with sealer. Torque the bolts to 20 ft. lbs.

9. Install the coolant outlet elbow and vacuum control valve, if equipped.

10. Connect the bypass and radiator hoses.

11. Connect the temperature sending unit wire.

12. Fill the cooling system with the proper coolant. Run the engine, check the coolant level and check for leaks.

MPV with 2954cc Engine

NOTE: The thermostat housing is located on the lower part of the engine at the end of the lower radiator hose.

1. Raise and safely support the vehicle.

2. Drain the cooling system.

3. Remove the lower radiator hose.

4. Unbolt and remove the housing and thermostat.

5. Install a new thermostat in the housing and position the housing on the engine. Torque the bolts to 19 ft. lbs.

6. Install the lower hose.

7. Fill the cooling system.

COOLING SYSTEM BLEEDING

After working on the cooling system, even to replace the thermostat, it must be bled. Air trapped in the system will prevent proper filling and leave the radiator coolant level low, causing a risk of overheating.

1. To bleed the system, start with the system cool, the radiator cap off and the radiator filled to about an inch below the filler neck.

2. Start the engine and run it at slightly above normal idle speed. This will insure adequate circulation. If air bubbles appear and the coolant level drops, fill the system with an anti-freeze/water mixture to bring the level back to the proper level.

3. Run the engine this way until the thermostat opens. When this happens, coolant will move abruptly across the top of the radiator and the temperature of the radiator will suddenly rise.

4. At this point, air is often expelled and the level may drop quite a bit. Keep refilling the system until the level is near the top of the radiator and re-

mains constant.

5. If the vehicle has an overflow tank, fill the radiator right up to the filler neck. Replace the radiator filler cap.

FUEL SYSTEM

Fuel System Service Precaution

When working with the fuel system certain precautions should be taken; always work in a well ventilated area, keep a dry chemical (Class B) fire extinguisher near the work area. Always disconnect the negative battery cable and do not make any repairs to the fuel system until all the necessary steps for repair have been reviewed.

RELIEVING FUEL SYSTEM PRESSURE

Fuel in the system remains under pressure, even with the ignition turned **OFF**. The fuel pressure must be relieved before performing any service on the fuel system.

1. Start the engine.
2. Disconnect the airflow meter connector.
3. After the engine stalls, turn **OFF** the ignition switch.
4. Reconnect the airflow meter.

PRIMING THE FUEL SYSTEM

After the system pressure has been relieved, the system must be re-pressurized.

1. Connect the terminals of the test connector.
2. Turn the ignition switch **ON** for 10 seconds and check for leaks.
3. Turn the ignition switch **OFF** and disconnect the jumper.

Fuel Filter

REMOVAL & INSTALLATION

Except MPV

The fuel filter is located at the rear of the vehicle, on the left side frame rail.

1. On fuel injected vehicles, relieve the fuel system pressure.
2. Disconnect the negative battery cable.
3. Raise and safely support the vehicle.
4. Disconnect the lines from the fuel filter and remove the filter retain-

Thermostat removal - 2954cc engine

ing bolts.

5. Remove the filter.
6. Install the new filter in position and connect the fuel lines. Make sure the filter is installed correctly.
7. Lower the vehicle. On fuel injected vehicles, pressurize the fuel system.
8. Connect the negative battery cable.

MPV

The fuel filter is located on top of the engine, next to the pulsation damper.

1. Relieve the fuel system pressure.
2. Disconnect the negative battery cable.
3. Remove the fuel lines from the filter.
4. Remove the filter mounting bolt and remove the filter.
5. Install the new filter in position and connect the fuel lines. Make sure to install the filter in the correct direction.
6. Pressurize the fuel system and connect the negative battery cable.

Mechanical fuel pump mounting

Mechanical Fuel Pump

PRESSURE TESTING

1. Disconnect the fuel line from the carburetor.
2. Connect a fuel pressure gauge in the line between the carburetor.
3. Plug the fuel pump return outlet.
4. Check the fuel pressure while the engine is idling. Correct fuel pressure should be 4–5 psi.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Disconnect and plug the inlet, outlet and return hoses at the fuel pump.
2. Remove the fuel pump mounting bolts and remove the fuel pump, insulator and gaskets.
3. Clean and inspect the mounting surfaces of the fuel pump and engine.
4. Using a new gasket with sealer, install the fuel pump on the engine and tighten the bolts to 11–14 ft. lbs.
5. Connect the fuel lines, run the engine and check for leaks.

Electric Fuel Pump

PRESSURE TESTING

1. Turn the ignition switch **OFF**. Relieve the fuel system pressure.
2. Disconnect the main fuel hose and connect a pressure gauge in line.
3. Connect the **B** and **D** terminals of the fuel pump control unit with a jumper wire.

4. Turn the ignition switch **ON** and check the fuel pressure. Correct pressure is 3–4 psi. at idle.

REMOVAL & INSTALLATION

Except MPV

1. Disconnect the negative battery cable. Relieve the fuel system pressure. Raise and support the vehicle safely.
2. Disconnect the fuel pump and sending unit wires at the connector, next to the tank.
3. Remove the fuel tank drain plug and drain the fuel into approved containers. With the fuel tank drained, support the tank.
4. Remove the fuel tank mounting straps and lower the tank enough to disconnect the fuel hoses. Disconnect the fuel filler hose at the fuel tank.
5. Disconnect and tag the fuel hoses at the fuel pump.
6. Remove the fuel tank from the vehicle.
7. Remove the fuel pump and float assembly from the tank.
8. Installation is the reverse of the removal procedure. Check the fuel pump operation when finished.

MPV

1. Relieve the fuel system pressure. Disconnect the negative battery cable.
2. Remove the rear seat cushion and lift the carpeting. Disconnect the electrical connector located near the pump cover. Remove the attaching screws and remove the cover.
3. Note the hookup locations of the fuel hoses. Disconnect fuel supply and return hoses and plug them. Remove the attaching screws and remove the pump/gauge unit assembly and gasket. If the gasket appears worn, replace it.

4. Unscrew and disconnect the electrical connectors for the pump from the assembly. Loosen the screw at the clamp which holds the pump in position. Loosen the clamps and remove the hose connecting the outlet of the pump to the assembly. Remove the pump. Use a new connecting hose between the pump outlet and the top of the pump/gauge assembly.

To install:

5. Install the pump into its mounting bracket and connect the fuel outlet hose to the pump. Secure the outlet hose with the clamps.
6. Support the pump by hand and install the retaining screw that holds the pump in place in the bracket. Connect the electrical connector to the pump. Install the pump/gauge assembly and secure with the attaching screws.
7. Connect fuel inlet and outlet lines to their respective connections. Check the fuel lines and the pump wiring to make sure that they are tight and in place. Use tie straps as required to secure the fuel hoses and the wiring.
8. Install the fuel pump cover and connect the connector to it. Install the rear seat cushion and reposition the carpeting.
9. Connect the negative battery cable and re-pressurize the fuel system.

Carburetor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the air cleaner and air inlet duct.
2. Disconnect the accelerator shaft from the throttle lever.
3. Disconnect and plug the fuel supply and return lines.

4. Disconnect the leads from the throttle solenoid and deceleration valve at the quick-disconnects.

5. Disconnect the carburetor to distributor vacuum line.

6. Disconnect the throttle return spring.

7. Disconnect the choke cable and if equipped, the cruise control cable.

8. Remove the carburetor attaching nuts from the intake manifold studs and remove the carburetor.

To install:

9. Install a new carburetor gasket on the manifold.

10. Install the carburetor and tighten the carburetor attaching nuts.

11. Connect the throttle return spring.

12. Connect the accelerator shaft to the throttle shaft.

13. Connect the electrical leads to the throttle solenoid and deceleration valve.

14. Connect the distributor vacuum line.

15. Connect the fuel supply and return lines.

16. Connect and adjust the choke cable and if equipped, the cruise control cable.

17. Install the air cleaner and air inlet duct. Connect the negative battery cable.

18. Run the engine and check for fuel leaks.

IDLE SPEED ADJUSTMENT

Check that the ignition timing, spark plugs, carburetor float level, etc. are all in normal operating condition. Turn off all lights and other unnecessary electrical loads.

1. Connect a tachometer to the engine.

2. Start and allow the engine to reach normal operating temperature. Check the idle speed and adjust it to the specification by turning the throttle adjusting screw. The idle speed should be 800–850 rpm in N or P.

IDLE MIXTURE ADJUSTMENT

1. Start the engine and allow it to reach normal operating temperature, let the engine run at idle.

2. Connect a dwellmeter (90 degrees, 4 cylinder) to the brown/yellow wire in the check connector of the A/F solenoid valve.

3. Check the idle mixture at specified idle speed. The idle mixture should be 20–70 degrees. If the idle mixture is not within specifications, adjust the idle mixture as follows:

a. To adjust the idle mixture, re-

move the carburetor and take out the spring pin. Reinstall the carburetor.

b. Be sure that the air cleaner is installed and the idle compensator is closed.

c. Warm up the engine and run it at idle speed.

d. Connect a tachometer to the engine.

e. Connect a dwellmeter (90 degrees, 4 cylinder) to the brown/yellow wire in the check connector of the A/F solenoid valve and read the meter. The standard value should be 27–45 degrees (at idle).

f. If the reading obtained is not within the specified range, adjust the idle mixture by turning the mixture adjust screw.

NOTE: If the adjustment cannot be made, it is probably because of a faulty oxygen sensor, or because of either a broken wire or a short in the wiring between the oxygen sensor and the control unit.

g. Tap in the spring pin.

SERVICE ADJUSTMENTS

For all carburetor service adjustment procedures and specifications, please refer to "Carburetor Service" in the Unit Repair section.

Fuel Injection

IDLE SPEED AND MIXTURE ADJUSTMENTS

The idle speed and mixture are controlled by the electronic control unit and are not adjustable.

Fuel Injector

REMOVAL & INSTALLATION

2606cc Engine

1. Relieve the fuel system pressure. Disconnect the negative battery cable.

2. Remove the air chamber.

3. Disconnect the vacuum hose.

4. Disconnect the fuel lines.

5. Remove the pressure regulator and delivery pipe.

6. Disconnect the injector wiring.

7. Pull off the injectors. Discard the grommets and O-rings.

8. Installation is the reverse of removal. Torque the delivery pipe bolts to 15 ft. lbs. Always use new O-rings coated with clean engine oil.

9. Re-pressurize the fuel system.

2954CC Engine

1. Perform fuel system pressure release procedure.

2. Disconnect the negative battery cable.

3. Loosen clamps securing air cleaner to throttle body hose and remove hose.

4. Remove the throttle cable and transmission kickdown linkage.

5. Remove harness connector from throttle position sensor (TPS), and automatic idle speed (AIS) motor.

6. Label and remove vacuum hoses from throttle body. Remove PCV and brake booster hoses from air intake plenum.

7. Remove EGR tube to intake plenum.

8. Remove electrical connection from charge temperature and coolant temperature sensor.

9. Remove vacuum connection from pressure regulator and air intake connection from manifold.

Fuel rail removal—2555cc and 2606cc engines

Fuel rail removal—2954cc engine

10. Remove fuel hoses to fuel rail connection.

11. Remove air intake plenum to manifold bolts (8) and remove air intake plenum and gaskets.

NOTE: Whenever air intake plenum is removed, cover intake manifold properly to avoid objects from entering cylinder head.

12. Disconnect fuel injector wiring harness from engine wiring harness.

13. Remove pressure regulator attaching bolts and remove pressure regulator from rail.

14. Remove fuel rail attaching bolts and remove fuel rail.

To install:

15. Make certain injectors are properly seated in receiver cup with lock rings in place and injector discharge holes are clean.

16. Lubricate injector O-rings with a clean drop of engine oil.

17. Install injector rail assembly making sure each injector seats in their respective ports. Torque fuel rail attaching bolts to 115 inch lbs.

18. Lubricate pressure regulator O-ring with a drop of clean engine oil and install regulator to fuel rail. Torque nuts to 77 inch lbs.

19. Install hold down bolts on fuel supply and return tube, and vacuum crossover tube.

20. Install and torque pressure regulator hose clamps to 10 inch lbs.

21. Reconnect injector wiring harness.

22. Reconnect vacuum hoses to fuel pressure regulator and fuel rail.

23. Set the air intake plenum gasket in place with beaded sealer in the UP position.

24. Install air intake plenum and tighten (8) attaching screws to 115 inch lbs.

25. Reconnect fuel line to fuel rail and tighten clamps to 10 inch lbs.

26. Reconnect EGR tube to intake

plenum and torque nuts to 200 inch lbs.

27. Reconnect electrical wiring to charge temperature sensor, coolant temperature sensor, TPS and AIS motor.

28. Reconnect vacuum connection to throttle body and air intake plenum.

29. Install accelerator cable and transmission kickdown cable.

30. Install air cleaner to throttle body hose and tighten clamps.

31. Reconnect negative battery cable. Re-pressurize the fuel system.

Maintenance timer assembly

Maintenance reset screw location—on the rear of the instrument cluster

EMISSION CONTROLS

Please refer to "Emission Control" in the Unit Repair section for system maintenance procedures. Due to the complex nature of modern electronic engine control systems, comprehensive diagnosis and testing procedures fall outside the confines of this repair manual. For complete information on diagnosis, testing and repair procedures concerning all modern engine and emission control systems, please refer to "Chilton's Guide to Electronic Engine Controls".

Emission Warning Lamps

RESETTING

Carbureted Vehicles

Carbureted vehicles incorporate an service engine light to indicate a fault in the feedback system. This light cannot be reset without repairing the fault in the system and erasing the trouble codes.

Fuel Injected Vehicles

Fuel injected vehicles (except California) incorporate a mileage sensor that keeps track of the vehicle mileage in conjunction with the odometer. The mileage sensor, at 80,000 miles, will illuminate the Malfunction Indicator Light (MIL). At this time the oxygen sensor must be replaced.

After replacing the oxygen sensor, reset the MIL using the following procedure:

1. Disconnect the negative battery cable.
2. Remove the instrument cluster.
3. Remove the screw in the middle of the circuit board, from the hole marked NO and install it in the hole marked NC.
4. Install the instrument cluster.
5. Connect the battery cable and turn the ignition ON. Make sure the MIL is out.

tery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is disconnected.

Engine

REMOVAL & INSTALLATION

Except MPV

1. Disconnect the battery ground.
 2. Drain the cooling system.
 3. Remove the air cleaner. Remove the oil pressure sending unit.
 4. Remove the fan and shroud. Remove the accelerator cable.
 5. Remove the fuel line. Remove the heater hoses.
 6. Remove the brake vacuum hose.
 7. Remove the 3-way solenoid valve and vacuum sensor. Remove the duty solenoid valve. Remove the vacuum switch.
 8. Remove the canister hoses. Disconnect the engine harness coupler and remove the engine ground wire.
 9. Remove the upper and lower radiator hoses. Remove the radiator and condenser.
 10. Remove the secondary air pipe. Disconnect the exhaust pipe.
 11. Remove the air conditioning compressor and mounting bracket. Do not disconnect the lines.
 12. Remove the power steering pump. Remove the starter.
 13. Raise and safely support the vehicle. Drain the engine oil. Remove the gusset plates. Remove the rear undercover.
 14. Support the transmission with a suitable jack.
 15. Attach an suitable lifting device to the engine lifting eyes. Take up the weight of the engine.
 16. Remove the flywheel-to-converter nuts on vehicles with automatic transmission.
 17. Remove the engine-to-transmission bolts. Remove the engine mount nuts.
 18. Pull the engine forward to disengage it from the transmission. Raise the engine and remove it from the vehicle.
- To install:**
19. Lower the engine into the vehicle.
 20. Install the engine-to-transmission bolts. Torque the bolts to 38 ft. lbs.
 21. Install the engine mount nuts. Torque the nuts to 35 ft. lbs.
 22. Install the flywheel-to-converter nuts on vehicles with automatic transmission. Torque the bolts to 35 ft. lbs.

23. Remove the engine lifting device. Remove the transmission floor jack.
24. Install the rear undercover. Install the gusset plates. Install the starter.
25. Install the power steering pump, the air conditioning compressor and mounting bracket.
26. Connect the exhaust pipe. Install the secondary air pipe.
27. Install the condenser and the radiator. Install the upper and lower radiator hoses.
28. Install the engine ground wire. Connect the engine harness coupler.
29. Install the canister hoses. Install the vacuum switch.
30. Install the duty solenoid valve. Install the 3-way solenoid valve and vacuum sensor.
31. Install the brake vacuum hose. Install the heater hoses and the fuel line.
32. Install the accelerator cable.
33. Install the fan and shroud. Install the oil pressure sending unit.
34. Install the air cleaner.
35. Fill the engine with the correct amount of oil.
36. Fill the cooling system.
37. Connect the negative battery cable and install the hood.

MPV

1. Disconnect the negative battery cable. Drain the cooling system.
2. Remove the starter.
3. Remove the battery. Remove the air duct.
4. Remove the engine undercover. Remove the upper and lower radiator hoses.
5. Remove the fan and shroud. On vehicles with automatic transmission, remove the cooler lines.
6. Remove the radiator and condenser.
7. Disconnect the air flow sensor connector.
8. Remove the accessory belts. Remove the air cleaner.
9. Remove the heater hoses. Remove the accelerator cable.
10. Remove the brake vacuum hose. Remove the canister hoses.
11. Relieve the fuel system pressure and remove the fuel lines.
12. Remove the alternator. Properly discharge the air conditioning system. Remove the air conditioning compressor and mounting bracket.
13. Remove the power steering pump. Disconnect the emissions harness connectors.
14. Remove the engine ground wire. Remove the engine shroud upper panel.
15. Disconnect the exhaust pipe.
16. Remove the lower grille panel. Remove the grille.

ENGINE MECHANICAL

NOTE: Disconnecting the bat-

17. Raise and safely support the vehicle. Drain the engine oil. Remove the engine shroud plate.

18. Support the transmission with a floor jack.

19. Attach a suitable lifting device to the engine lifting eyes. Take up the weight of the engine.

20. Remove the flywheel-to-converter nuts on vehicles with automatic transmission.

21. Remove the engine-to-transmission bolts.

22. Remove the engine mount nuts.

23. Pull the engine forward to disengage it from the transmission. Raise the engine and remove it from the vehicle.

To install:

24. Lower the engine into the vehicle.

25. Install the engine-to-transmission bolts. Torque to 35 ft. lbs.

26. Install the engine mount nuts. Torque to 35 ft. lbs.

27. Install the flywheel-to-converter nuts on trucks with automatic transmission. Torque to 35 ft. lbs.

28. Remove the engine lifting device. Remove the transmission floor jack.

29. Install the engine shroud upper plate.

30. Install the grille. Install the lower grille panel.

31. Connect the exhaust pipe. Install the engine shroud upper panel.

32. Install the engine ground wire. Connect the emissions harness connectors.

33. Install the power steering pump. Install the air conditioning compressor and mounting bracket.

34. Install the alternator. Install the fuel lines.

35. Install the canister hoses. Install the brake vacuum hose.

36. Install the accelerator cable. Install the heater hose and install the air cleaner.

37. Install the accessory belts.

38. Connect the air flow sensor connector. Install the condenser and radiator.

39. On vehicles with automatic transmission, install the cooler lines.

40. Install the fan and shroud. Install the upper and lower radiator hoses.

41. Install the engine undercover. Install the air duct.

42. Install the battery. Install the starter.

43. Fill the crankcase with the correct amount of oil.

44. Fill the cooling system.

45. Connect the negative battery cable.

Cylinder Head

REMOVAL & INSTALLATION

1998cc and 2184cc Engines

1. Disconnect the negative battery cable and drain the cooling system.

2. Disconnect the spark plug wires and remove the spark plugs.

3. Disconnect the accelerator cable. If equipped with automatic transmission, disconnect the throttle cable.

4. Remove the air intake pipe.

5. Remove the air cleaner and fuel hose. Cover the fuel hose to prevent leakage.

6. Remove the upper radiator hose, water bypass hose, heater hose, and brake vacuum hose.

7. Remove the 3-way and EGR solenoid valve assemblies.

8. Disconnect the engine harness connector and ground wire.

9. Remove the vacuum chamber and exhaust manifold insulator.

10. Remove the EGR pipe and exhaust pipe.

11. Remove the exhaust manifold.

12. Remove the intake manifold bracket and the intake manifold.

13. Remove the distributor.

14. Loosen the air conditioning compressor and bracket, position it off to the side and tie it out of the way.

15. Remove the upper timing belt cover and the timing belt tensioner spring. Remove the timing belt.

16. Remove the cylinder head cover and cover gasket.

18. Loosen the cylinder head bolts in the proper sequence and remove the cylinder head and head gasket.

To install:

19. Thoroughly clean the cylinder head and cylinder block contact surfaces to remove any dirt or oil. Check the cylinder head for warpage and cracks. The maximum allowable con-

Cylinder head bolt removal sequence—2954cc engine

Cylinder head bolt removal sequence—2606cc engine

Cylinder head bolt installation sequence—2954cc engine

tact distortion is 0.15mm (0.038 in.). Inspect the cylinder head bolts for damaged threads and make sure they are free from grease and dirt.

20. Lay the new gasket on the surface of the block.

21. Set the cylinder head on the gasket.

22. Coat the bolt threads and seat surfaces with clean engine oil and torque the bolts in the proper sequence to the correct torque.

23. Apply a suitable sealant to the 4 corners of the cylinder head and install the cover with a new gasket. Torque the cover nuts to 52–69 inch lbs.

24. Make sure that the camshaft pulley and front housing timing marks are still aligned and install the timing belt.

25. Complete the remainder of the installation by reversing the removal procedure. Fill the cooling system to the proper level and connect the negative battery cable.

2555cc and 2606cc Engines

1. Disconnect the battery and drain the cooling system. Relieve the fuel system pressure.

2. Remove the air cleaner assembly.

3. Disconnect the upper radiator hose and heater hose.

4. Disconnect the vacuum hoses and electrical wiring.

5. Separate the throttle linkage.

6. Remove carburetor-to-valve cover bracket. On fuel injected vehicles, remove the throttle body bracket.

7. Disconnect the spark plug wires after marking them for reinstallation. Remove the distributor.

8. Remove the fuel lines. Plug the line leading to the gas tank to prevent fuel leakage.

9. Remove the engine valve cover.

10. Remove the water pump belt and pulley.

11. Rotate crankshaft until No. 1 piston is at the top of its compression stroke (both valves closed).

12. Draw a mark on the timing chain in line with the timing mark on the camshaft sprocket.

13. Remove the camshaft sprocket bolt, sprocket and distributor drive gear. Maintain adequate tension on the sprocket and chain assembly to prevent the chain from disengaging the crankshaft sprocket.

14. Raise the vehicle and disconnect air feeder hoses.

15. Remove the power steering pump and set aside.

16. Remove the dipstick tube and engine ground wire.

17. Remove the exhaust manifold shield.

18. Separate the exhaust manifold from converter.

19. Remove the cylinder head bolts in the correct sequence. Head bolts should be loosened in sequence to prevent head warpage.

20. Remove the cylinder head with intake manifold still attached.

To install:

21. Install a new cylinder head gasket. Install the cylinder head assembly.

22. Install the cylinder head bolts and torque in sequence to the correct torque. Torque cylinder head to chain case cover bolts (2) to 13 ft. lbs.

23. From beneath the vehicle connect the converter to exhaust manifold.

24. Connect the air feeder hoses.

25. Install the exhaust manifold shield.

26. Install the power steering pump.

27. Install the dipstick tube and engine ground wire.

28. Install the camshaft sprocket and chain assembly with marks previously made. Install the distributor drive gear and sprocket bolt, tighten sprocket bolt to 54 Nm (40 ft. lbs.).

29. Install the water pump pulley and belt.

30. Install the engine valve cover.

31. Install the fuel pump and fuel lines.

32. Install the distributor and connect spark plug wires.

33. Install the carburetor-to-valve cover bracket. Install the throttle body bracket, on fuel injected vehicles.

34. Install the throttle linkage.

35. Install the vacuum hoses and electrical wiring.

36. Install the upper radiator hose and heater hose.

37. Install the air cleaner.

38. Connect battery cable and refill cooling system.

2954cc Engine

1. Position the engine at TDC on the compression stroke.

2. Properly relieve the fuel system pressure.

3. Disconnect the negative battery cable.

4. Remove the air cleaner assembly. Drain the cooling system.

6. Remove the spark plug wires. Remove the fresh air duct assembly.

8. Remove the cooling fan and radiator cowl. Remove the drive belts.

9. Remove the air conditioning compressor idler pulley. If necessary, remove the compressor and position it to the side.

10. Remove the crankshaft pulley and baffle plate.

12. Remove the coolant bypass hose. Remove the upper radiator hose.

13. Remove the timing belt cover assembly retaining bolts. Remove the timing belt cover assembly and gasket.

14. Turn the crankshaft to align the mating marks of the pulleys.

15. Remove the upper idler pulley. Remove the timing belt. If reusing the belt be sure to mark the direction of rotation.

16. Disconnect and plug canister, brake vacuum and fuel hoses. If equipped with automatic transmission, disconnect the automatic transmission vacuum hose.

17. Remove the 3-way solenoid valve assembly and disconnect all engine harness connector and grounds.

18. If equipped with automatic transmission, remove the dipstick. Disconnect the required vacuum hoses. Disconnect the accelerator linkage.

19. Remove the distributor and the EGR pipe.

20. Remove and discard the O-rings from the extension manifolds and purchase new ones. Remove the intake manifold by loosening the retaining bolts in the proper sequence.

21. Remove the cylinder head cover, gasket and seal washers.

22. Remove the center exhaust pipe insulator and pipe. Disconnect the exhaust manifold retaining bolts. Remove the exhaust manifold with insulator.

23. Remove the seal plate.

24. Remove the cylinder head retaining bolts in the proper sequence in 2 or 3 stages. Remove the cylinder head from the vehicle.

25. Thoroughly clean the cylinder head and cylinder block contact surfaces to remove any dirt or oil. Check the cylinder head for warpage and cracks. The maximum allowable warpage is 0.10mm. Inspect the cylinder head bolts for damaged threads and make sure they are free from grease and dirt.

26. Check the oil control plug projection at the cylinder block. Projection should be 0.53–0.57mm. If correct, apply clean engine oil to a new O-ring and position it on the control plug.

To install:

27. Place the new cylinder head gasket on the left bank with the L mark facing up. Place the new cylinder head gasket on the right bank with the R mark facing up. Install the cylinder head onto the block. Tighten the head bolts in the following manner:

a. Coat the threads and the seating faces of the head bolts with clean engine oil.

b. Torque the bolts in the proper sequence to 14 ft. lbs.

c. Paint a mark on the head of each bolt.

d. Using this mark as a reference, tighten the bolts in the proper sequence an additional 90 degrees.

e. Repeat Step d.

28. Install the seal plate. Install the exhaust manifold with insulator.

29. Connect the exhaust manifold retaining bolts. Install the center exhaust pipe insulator and pipe.

30. Install the cylinder head cover, gasket and seal washers.

31. Install the intake manifold and torque the bolts to specification in the proper sequence. Install the O-rings from the extension manifolds.

32. Install the distributor and the EGR pipe.

33. If equipped with automatic transmission, install the dipstick. Connect the required vacuum hoses. Connect the accelerator linkage.

34. Install the 3-way solenoid valve assembly and connect all engine harness connector and grounds.

35. Connect the canister, brake vacuum and fuel hoses. If equipped with automatic transmission, connect the automatic trasmission vacuum hose.

36. Install the timing belt.

37. Make sure that all the timing marks are aligned properly.

48. Install the upper idler pulley and torque the mounting bolt to 27–38 ft. lbs.

39. Install the upper idler pulley. Install the timing belt cover assembly and new gasket.

40. Install the upper radiator hose. Install the coolant bypass hose.

41. Install the crankshaft pulley and baffle plate.

42. Install the compressor. Install the air conditioning compressor idler pulley.

43. Install the accessory drive belts. Install the cooling fan and radiator cowl.

44. Install the fresh air duct assembly. Install the spark plug wires.

45. Fill the cooling system. Install the air cleaner assembly.

46. Connect the negative battery cable.

ing a finger over the spark plug hole while rotating the engine. When compression is felt, the No. 1 cylinder is on the compression stroke. Rotate the engine with a wrench on the crankshaft pulley and stop it at TDC of the compression stroke on the No. 1 cylinder, as confirmed by the alignment of the TDC mark in the crankshaft pulley and the timing pointer.

5. Check the valve clearances with by inserting a feeler gauge between the end of the valve stem and the rocker arm. The clearance can be checked for Nos. 1 and 2 intake valves and Nos. 1 and 3 exhaust valves.

6. If the valve clearance is incorrect, loosen the adjusting screw locknut and adjust the clearance by turning the adjusting screw with the feeler blade inserted. Hold the adjusting screw in the correct position and tighten the locknut. Recheck the clearance.

7. Rotate the crankshaft, in the normal direction of rotation, until No. 4 piston is at TDC compression. Adjust Nos. 3 and 4 intake valves and Nos. 2 and 4 exhaust valves.

8. Install the rocker arm cover and torque the nuts to 18 inch lbs.

2555cc and 2606cc Engines

NOTE: These engines, are equipped with hydraulic valve lash adjusters. The engines have a third valve called a Jet Valve located beside the intake valve of each cylinder. The Jet valve works off the intake valve rocker arm and injects a swirl of air into the combustion chamber to promote more complete burning of fuel. The Jet Valve must be adjusted on all engines, whether or not the engine has hydraulic lash adjusters. On engines equipped with hydraulic lash adjusters, only the Jet valve must be adjusted. When adjusting valve clearances, the jet valve must be adjusted before the intake valve.

1. Start the engine and allow it to reach normal operating temperature (170–190°F).

2. Stop the engine and remove the air cleaner. Remove the rocker cover.

3. Disconnect the coil-to-distributor wire at the coil.

4. Watch the rocker arms for No. 1 cylinder and rotate the crankshaft un-

Adjusting the valve clearance – 1998cc and 2184cc engines, others similar

Valve Lash

ADJUSTMENT

1998cc Engine

1. Run the engine until normal operating temperature is reached.

2. Turn off the engine and remove the rocker cover.

3. Torque the cylinder head bolts to 60–64 ft. lbs.

4. Rotate the crankshaft so that the No.1 cylinder is at TDC. This can be determined, by removing the spark plug from the No.1 cylinder and plac-

Adjusting the jet valve clearance – 2555cc and 2606cc engines

til the exhaust valve is closing and the intake valve has just started to open. At this point, No. 4 cylinder will be at top dead center (TDC), commencing its firing stroke.

5. Loosen the locknut on cylinder No. 4 intake valve and back off the intake valve adjusting screw 2 or more turns.

6. Loosen the locknut on the jet valve adjusting screw.

7. Turn the jet valve adjusting screw counterclockwise and insert a 0.006 in. feeler gauge between the jet valve stem and the adjusting screw.

8. Tighten the adjusting screw until it touches the feeler gauge. Take care not to press in the valve while adjusting because the jet valve spring is very weak.

NOTE: If the adjusting screw is tight, special care must be taken to avoid pressing down on the jet valve when adjusting the clearance or a false reading will result.

9. Tighten the locknut securely while holding the rocker arm adjusting screw with a suitable tool, to prevent it from turning.

10. Make sure that a 0.006 in. feeler gauge can just be inserted between the jet valve and the rocker arm.

11. Adjust No. 4 cylinder's intake valve to 0.006 in. and exhaust valve to 0.010 in. Tighten the adjusting screw locknuts and recheck each clearance.

12. Perform Step 4 in conjunction with the chart to adjust the remaining 3 cylinders.

13. Install the rocker cover and all other components. Run the engine and check for oil leaks at the valve cover.

2954cc Engine

This engine has hydraulic lash adjusters and no adjustment is needed.

Rocker Arms and Shafts

REMOVAL & INSTALLATION

1998cc and 2184cc Engines

1. Disconnect the negative battery cable.

2. Disconnect the accelerator cable from the carburetor.

3. Disconnect the air bypass valve cable.

4. Disconnect and tag the spark plug wires. Remove the wires from the spark plug wire clips on the rocker covers and position them out of the way.

5. Remove the rocker cover and discard the gasket.

6. Remove the rocker arm shaft attaching bolts evenly and remove the

rocker arm shafts.

7. Install the rocker arm assemblies on the cylinder head. Torque the bolts to 13–20 ft. lbs.

8. Check and adjust the valve adjustment.

9. Clean the mating surfaces of the cylinder head and rocker cover.

10. Install the rocker cover with a new gasket. Torque the bolts to 24–36 inch lbs.

11. Install the spark plug wires on the spark plugs. Place the wires in the clips on the rocker cover. Connect the choke and air bypass valve cable.

12. Start the engine and check for leaks.

13. Allow the engine to reach operating temperature, torque the cylinder head bolts to 60–64 ft. lbs. and adjust the valves lash with the engine hot.

2555cc and 2606cc Engines

NOTE: Eight special holders are needed, tool No. MD998443 or equivalent, to retain the hydraulic lash adjusters when the valve train is disassembled.

1. Relieve the fuel system pressure. Disconnect the negative battery cable. Remove the rocker cover. Loosen the camshaft sprocket bolt until it can be turned by hand. The timing mark on the sprocket ends up on the extreme right of the sprocket bolt as viewed from the front. The TDC mark on the front crankshaft pulley must line up with the timing scale on the front cover.

2. Remove the camshaft sprocket bolt without allowing the tension on the timing chain or belt to be lost. Place the sprocket in the sprocket holder of the front cover or lower timing belt cover. Make sure not to lose tension on the belt/chain. Make sure also that the crankshaft is not turned throughout the work. If equipped with hydraulic lash adjusters, put the special clips on the 8 hydraulic adjusters at the outer ends of all 8 rocker arms. Note that these clips go over the lash adjusters that actuate the large intake valves, not on the small adjusting screw for the smaller jet valves.

3. Loosen, but do not remove the camshaft bearing cap bolts. After all bolts have been loosened, remove them and, holding the ends so the assembly stays together, remove the rocker shaft assembly from the cylinder head. The rearmost cam bearing cap is not associated with the rocker shafts and need not be removed.

4. Keep all parts in original order. **To install:**

5. Assemble the parts of the rocker assembly as follows:

a. Install left and right side rock-

er shafts into the front bearing cap. Notches in the ends of the shaft must be upward. Install the bolts for the front cap to retain the shafts in place. Note that the left rocker shaft is longer than the right rocker shaft.

b. Install the wave washer onto the left rocker shaft with the bulge forward. Then, coat the inner surfaces of the rockers and the upper bearing surfaces of the bearing caps with clean engine oil and assemble rockers, springs and the remaining bearing caps in the order in which removed. Note that the intake rockers are the only ones with the jet valve actuators. Note also that the rockers are labeled for cylinders 1–3 and 2–4 because the direction that the jet valve actuator faces, changes.

c. Use mounting bolts to hold the caps in place after each is assembled. When the assembly is complete, install it onto the head and start all mounting bolts into the head and tighten finger tight.

6. Torque the attaching bolts for the rocker assembly 14–15 ft. lbs. working from the center outward.

7. Without removing tension from the timing chain or belt, lift the sprocket out of the holder and position it against the front of the cam. Make sure the locating tang on the sprocket goes into the hole in the front of the cam.

8. Torque the bolt to 58–72 ft. lbs.

9. Adjust the valve lash.

9. Apply sealant to the top surface of the semicircular seals in the head and then install the valve cover.

2954cc Engine

1. Relieve the fuel system pressure. Disconnect the negative battery cable. Remove the rocker cover.

2. Loosen the rocker shaft bolts, going in reverse of the torquing sequence in several stages.

3. Remove the rocker shaft assembly and bolts as an assembly. Stuff a rag in the drain hole to prevent the valve keepers from falling into the oil pan.

4. During the installation, make sure all the spherical valve operators at the outer ends of the rocker levers are positioned so the flat surface is against the top of the valve stem.

5. Position the rocker assembly toward the exhaust side of the engine so that the exhaust valve rocker arms are offset 1mm from the centers of the valve stems.

6. Torque the head bolts in several stages using the correct torque sequence. Torque the rocker bolts in sequence to 14–19 ft. lbs. Be careful not to catch the rocker arm shaft spring between the shaft and the mounting

boss during installation.

Intake Manifold

REMOVAL & INSTALLATION

1998cc and 2184cc Engines

1. Disconnect the negative battery cable. Drain the cooling system.
2. Remove the air cleaner.
3. Remove the accelerator linkage.
4. Disconnect the choke cable. Disconnect and plug the fuel line. Plug the fuel line.
5. Disconnect the PCV valve hose.
6. Disconnect the heater return hose and bypass hose.
7. Remove the intake manifold-to-cylinder head attaching nuts.
8. Remove the manifold and carburetor as an assembly.
9. Clean the gasket mating surfaces.

To install:

10. Install a new gasket and the manifold on the studs. Torque the attaching nuts to specification, working from the center outward.
11. Connect the PCV valve hose to the manifold.
12. Connect the bypass and heater return hoses.
13. Install the accelerator linkage.
14. Connect the fuel line and choke cable.
15. Replace the air cleaner. Connect the negative battery cable.
16. Fill the cooling system. Run the engine and check for leaks.

2555cc Engine

1. Disconnect the negative battery cable.
2. Drain the cooling system and disconnect the hoses from the water pump to the intake manifold.
3. Disconnect the carburetor air horn adapter and move it aside.
4. Disconnect the vacuum hoses and throttle linkage from the carburetor.
5. Disconnect the fuel inlet line at the fuel filter.
6. Remove the fuel filter and fuel pump and move it aside.
7. Remove the intake manifold retaining nuts and washers and remove the manifold.
8. Remove old gasket. Clean cylinder head and manifold gasket surface. Check for cracks or warpage. Install a new gasket on cylinder head.

To install:

9. Install the manifold to the cylinder head. Install the mounting nuts and tighten to the correct specification. Tighten from the inside nuts working outward.
10. Install the fuel pump and filter.

11. Install the carburetor air horn.
12. Install the throttle control cable.
13. Install the cooling system hose from water pump to manifold.
14. Install the vacuum hoses.
15. Connect the negative battery cable.

2606cc Engine

1. Relieve the fuel system pressure. Disconnect the negative battery cable.
2. Drain the cooling system.
3. Disconnect the water hoses and plug them.
4. Disconnect the air inlet duct from the air cleaner and disconnect the air flow meter connector.
5. Label and disconnect all vacuum hoses connected to the manifold.
6. Remove the air cleaner, air cleaner element, air flow meter and air funnel.
7. Disconnect the bypass air control (BAC) valve connector, water hoses and remove the valve.
8. Disconnect the throttle sensor connector and the accelerator cable. Remove the throttle body and gasket.
9. Label and disconnect all remaining hoses, pipes, sensors and wires connected to the manifold.
10. Remove the wiring harness bracket.
11. Disconnect the air intake pipe.
12. Remove the manifold attaching nuts and lift the manifold straight up from the studs.

To install:

13. Install a new gasket on the studs, coated with sealer.
14. Install the manifold on the studs. Torque the manifold bolts to 18 ft. lbs. in 2 even steps of 9 ft. lbs. each.
15. Connect the air intake pipe.
16. Install the wiring harness bracket.
17. Connect all remaining hoses, pipes, sensors and wires at to the manifold.
18. Install the throttle body and gasket.
19. Connect the throttle sensor connector and the accelerator cable.
20. Install the BAC valve. Connect the bypass air control valve connector and water hoses.
21. Install the air cleaner, air cleaner element, air flow meter and air funnel.
22. Connect all remaining vacuum hoses at to the manifold.
23. Connect the air inlet duct from the air cleaner and connect the air flow meter connector.
24. Connect the water hoses. Fill the cooling system.
26. Connect the negative battery cable.

2954cc Engine

1. Relieve the fuel system pressure.

Intake manifold removal sequence
— 2954cc engine

Intake manifold installation sequence
— 2954cc engine

Disconnect the negative battery cable. Disconnect the water hoses.

2. Disconnect the air inlet duct from the air cleaner and disconnect the air flow meter connector.

3. Locate the 2 solenoid valves (TICS and purge air control) that are bolted to the front of the air cleaner. Disconnect the vacuum hoses and label them.

4. Remove the air cleaner, air cleaner element, air flow meter and air funnel.

5. Disconnect the bypass air control (BAC) valve connector, water hoses and remove the valve.

6. Disconnect the throttle sensor connector and the accelerator cable. Remove the throttle body and gasket.

7. Disconnect all vacuum hoses, EGR pipe, EGR position sensor connector, water hose and ground wire.

8. Remove the wiring harness bracket.

9. Disconnect the air intake pipe from the dynamic chamber with the gasket.

10. Mark the extension manifolds RIGHT and LEFT for assembly reference as they are not interchangeable. Remove the extension manifolds with their gaskets from the dynamic chamber.

11. Disconnect the intake air thermo sensor connector, vacuum hoses and ground connectors.

12. Remove the attaching nuts and lift the dynamic chamber straight up from the intake manifold studs. Drain the radiator at this time and disconnect all remaining connectors, fuel

hoses, water hoses.

13. Loosen the intake manifold nuts in 2 stages, in the correct sequence. Lift the intake manifold from the engine and remove the intake manifold gaskets. Insert clean rags in the intake ports or cover them with masking tape to prevent anything from falling into the engine.

14. Visually inspect the intake manifold for cracks, warpage or any other type of damage and replace as necessary. Remove all gasket material from the seating surface on the manifold and the engine. Forward of one of the studs that secure the dynamic chamber is an O-ring that seal the manifold to the chamber. Remove this O-ring and replace it with a new one.

To install:

15. Place the new intake manifold gaskets onto the cylinder block and lower the manifold over the gaskets. Install the intake manifold washers with the white paint marks facing up. Install the retaining nuts and torque the nuts in stages to the correct torque and in the proper sequence.

16. Install connectors, fuel hoses, water hoses and vacuum hoses.

17. Install the dynamic chamber. Torque the retaining nuts to 14–18 ft. lbs.

18. Install the intake air thermo sensor ground connectors and vacuum hoses.

19. Install the extension manifolds with new gaskets and new O-rings.

20. Install the intake air pipe with new gaskets and wiring bracket.

21. Install the ground wire, water hose, EGR position connector, EGR pipe and vacuum hoses.

22. Install the throttle body with new gasket, accelerator cable and throttle sensor connector. Check the deflection of the accelerator cable. If not within 0.04–0.12 in. (1–3mm), adjust with the nuts on the cable bracket.

23. Install the BAC valve, water hoses and connector.

24. Install the air funnel, air hoses, air flow meter, filter element and air cleaner.

25. Install the TICS and purge control solenoid valves, air flow meter connector, vacuum chamber and air duct.

26. Make sure that all hose connections are tight and fill the cooling system to the proper level. Connect the negative battery cable. Start the engine and check for leaks.

Exhaust Manifold

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.

2. Disconnect the exhaust pipe from the exhaust manifold. Remove the exhaust manifold heat shield. On the 2954cc and 2606cc engine disconnect the wire to the oxygen sensor.

3. Remove the exhaust manifold mounting nuts and remove the manifold.

4. To install, apply a light film of grease to the exhaust manifold mating surfaces before installation.

5. Install the manifold on the studs and install the mounting nuts. Torque the attaching nuts to the correct specification.

6. Install a new exhaust pipe gasket. Connect the exhaust pipe to the exhaust manifold and torque the nuts to the correct specification.

Timing Chain Front Cover

REMOVAL & INSTALLATION

2555cc and 2606cc Engines

1. Relieve the fuel system pressure. Disconnect the negative battery cable.

2. Remove the air cleaner assembly.

3. Remove the accessory drive belts.

4. Remove the alternator mounting bolts and remove alternator.

5. Remove the power steering mounting bolts and set power steering pump aside.

6. Remove the air conditioning compressor mounting bolts and set compressor aside.

7. Raise and safely support the vehicle. Remove right inner splash shield.

8. Drain the engine oil.

9. Remove the crankshaft pulley.

10. Lower the vehicle and place a suitable jack under the engine with a piece of wood between jack and lifting point.

11. Raise the jack until contact is made with the engine. Relieve pressure by jacking slightly and remove the center bolt from the right engine mount. Remove right engine mount.

12. Remove the engine oil dipstick.

13. Remove the engine valve cover.

14. Remove the front (2) cylinder head to timing chain cover bolts.

15. Raise and safely support the vehicle. Remove the oil pan retaining bolts and lower the oil pan.

16. Remove the screws holding the timing indicator and engine mounting plate.

17. Remove the bolts holding the timing chain case cover and remove cover.

18. Clean and inspect chain case cover for crack or other damage.

To install:

19. Position a new timing chain case cover gasket on case cover. Trim as required to assure fit at top and bottom.

20. Coat the cover gasket with sealant. Install chain case cover and tighten mounting bolts to 13 ft. lbs.

21. Install the (2) front cylinder head to timing chain case cover mounting bolts and tighten to 13 ft. lbs.

22. Install the engine oil pan tighten screws to 53 inch lbs.

23. Install the engine mounting plate and timing indicator.

24. Install the crankshaft pulley.

25. Install the right engine mount, lower engine and install right engine mount center bolt.

26. Install the engine valve cover.

27. Install the engine oil dipstick.

28. Install the air conditioner compressor.

29. Install the power steering pump.

30. Install the alternator.

31. Install the accessory drive belts.

32. Fill the engine crankcase with recommended engine oil.

33. Install the air cleaner assembly.

Timing chain guide location—2555cc and 2606cc engines

Timing case and chain assembly—2555cc and 2606cc engines

34. Connect the negative battery cable.

Front Cover Oil Seal

REPLACEMENT

2555cc and 2606cc Engine

NOTE: The front cover oil seal can be removed and a new one installed without removing the front cover.

1. Disconnect the negative battery cable.
2. Drain the cooling system.
3. Disconnect the upper and lower radiator hoses and remove the radiator.
4. Remove the drive belt(s).
5. Remove the crankshaft pulley.
6. Pry the front oil seal from the front cover.
7. Clean the pulley and seal area.

To install:

8. Press a new front seal into position (flush).
9. Install the crankshaft pulley and torque the bolt to specifications.
10. Install the drive belt(s) and adjust the tension.
11. Install the radiator and connect the upper and lower hoses. Fill the cooling system.
12. Start the engine and check for leaks.
13. Install the hood.

Timing Chain and Gears

REMOVAL & INSTALLATION

2555cc and 2606cc Engines

NOTE: These engines are equipped with 2 silent shafts which cancel the vertical vibrating force of the engine and the secondary vibrating forces, which include the sideways rocking of the engine due to the turning direction of the crankshaft and other rolling parts. The secondary vibrating forces can be cancelled if forces equivalent in magnitude but opposite in direction are produced. In these engines, the opposite force is produced by silent shafts located in the upper left and lower right sides in the front of the cylinder block. The shafts are driven by a duplex chain and are turned by the crankshaft. The silent shaft chain assembly is mounted in front of the timing chain assembly and must be removed to service the timing chain.

1. Disconnect the negative battery cable. Relieve the fuel system pressure.
2. Drain the radiator and remove it from the vehicle.
3. Remove the cylinder head.
4. Remove the cooling fan, spacer, water pump pulley and belt.
5. Remove the alternator. Remove the water pump.
6. Raise and support the vehicle safely. Drain the engine oil.
7. Remove the oil pan and screen. Remove the crankshaft pulley.
8. Lower the vehicle. Remove the timing case cover.
9. Remove the chain guides from the outer chain.
10. Remove the locking bolts from the chain sprockets.
11. Remove the crankshaft sprocket, silent shaft sprocket and the outer chain.
12. Remove the crankshaft and camshaft sprockets and the timing chain.
13. Remove the camshaft sprocket holder and the chain guides, both left and right.
14. Remove the tensioner.
15. Remove the sleeve from the oil pump. Remove the oil pump by first removing the bolt locking the oil pump driven gear and the right silent shaft, then remove the oil pump mounting bolts. Remove the silent shaft from the engine block.

NOTE: If the bolt locking the oil pump and the silent shaft is

hard to loosen, remove the oil pump and the shaft as a unit.

16. Remove the left silent shaft thrust washer and remove the shaft from the engine block.

17. Install the right silent shaft into the engine block.

18. Install the oil pump assembly. Do not loose the woodruff key from the end of the silent shaft. Torque the oil pump mounting bolts to 6-7 ft. lbs.

19. Tighten the silent shaft and the oil pump driven gear mounting bolt.

NOTE: The silent shaft and the oil pump can be installed as a unit, if necessary.

20. Install the left silent shaft into the engine block.

21. Install a new O-ring on the thrust plate and install the unit into the engine block, using a pair of bolts without heads, as alignment guides.

NOTE: If the thrust plate is turned to align the bolt holes, the O-ring may be damaged.

22. Remove the guide bolts and install the regular bolts into the thrust plate and tighten securely.

23. Rotate the crankshaft to bring No. 1 piston to TDC.

24. Install the cylinder head.

25. Install the sprocket holder and the right and left chain guides.

26. Install the tensioner spring and sleeve on the oil pump body.

27. Install the camshaft and crankshaft sprockets on the timing chain, aligning the sprocket punch marks to the plated chain links.

28. While holding the sprocket and chain as a unit, install the crankshaft sprocket over the crankshaft and align it with the keyway.

29. Keeping the dowel pin hole on the camshaft in a vertical position, install the camshaft sprocket and chain on the camshaft.

NOTE: The sprocket timing mark and the plated chain link should be at the 2-3 o'clock position when correctly installed. The chain must be aligned in the right and left chain guides with the tensioner pushing against the chain. The tension for the inner chain is predetermined by spring tension.

30. Install the crankshaft sprocket for the outer chain.

31. Install the 2 silent shaft sprockets and align the punched mating marks with the plated links of the chain.

32. Holding the 2 shaft sprockets and chain, install the outer chain in alignment with the mark on the crankshaft sprocket. Install the shaft

sprockets on the silent shaft and the oil pump driver gear. Install the lock bolts and recheck the alignment of the punch marks and the plated links.

33. Temporarily install the chain guides.

34. Tighten right chain guide securely.

35. Tighten bottom chain guide securely.

36. Adjust the position of the top chain guide, after shaking the right and left sprockets to collect any chain slack, so that when the chain is moved toward the center, the clearance between the chain guide and the chain links will be approximately $\frac{3}{64}$ inch. Tighten the top chain guide bolts.

37. Install the timing chain cover using a new gasket, being careful not to damage the front seal.

38. Using a new gasket, install the oil screen and oil pan. Torque the bolts to 4.5-5.5 ft. lbs.

39. Install the crankshaft pulley, alternator and accessory belts and the distributor.

40. Install the oil pressure switch, if removed. Connect the negative battery cable.

41. Install the fan blades, radiator, fill the cooling system and run the engine. Check for oil and water leaks.

Timing Belt Front Cover

REMOVAL & INSTALLATION

1998cc and 2184cc Engines

1. Disconnect the negative battery cable.
 2. Remove the distributor.
 3. Remove the fan and radiator shroud.
 4. Remove the alternator.
 5. Disconnect the air injection pipes.
 6. Remove the fan pulley, hub and bracket.
 7. If so equipped, remove the air conditioning compressor drive belt.
 8. If so equipped, remove the power steering pump drive belt.
 9. Remove the crankshaft pulley and baffle plate.
 10. Remove the upper, then the lower, belt covers.
- To install:**
11. Install the upper, then the lower, belt covers.
 12. Install the crankshaft pulley and baffle plate.
 13. Install the power steering pump drive belt.
 14. Install the air conditioning compressor drive belt.
 15. Install the fan pulley, hub and bracket.

1. Crankshaft pulley and baffle plate
2. Upper timing belt cover
3. Lower timing belt cover
4. Timing belt tensioner and spring
5. Timing belt
6. Idler pulley
7. Camshaft pulley
8. Front housing
9. Water pump assembly
10. Timing belt pulley

Timing belt and cover assembly—1998cc and 2184cc engines

Timing sprocket alignment—1998cc and 2184cc engines

16. Connect the air injection pipes.
17. Install the alternator.
18. Install the fan and radiator shroud.
19. Install the distributor.
20. Connect the negative battery cable.

2954cc Engine

1. Position the engine at TDC on the compression stroke. Properly relieve the fuel system pressure.
2. Disconnect the negative battery

cable. Remove the air cleaner assembly.

3. Drain the cooling system and remove the spark plug wires.

4. Remove the fresh air duct assembly. Remove the cooling fan and radiator cowl. Remove the drive belts.

5. Remove the air conditioning compressor idler pulley. If necessary, remove the compressor and position it to the side.

6. Remove the crankshaft pulley and baffle plate.

7. Remove the coolant bypass hose. Remove the upper radiator hose.

8. Remove the timing belt cover assembly retaining bolts. Remove the timing belt cover assembly and gasket.

9. Installation is the reverse of the removal procedure.

Timing Belt and Tensioner

REMOVAL & INSTALLATION

1998cc and 2184cc Engines

1. Disconnect the negative battery cable.
2. Drain the cooling system.
3. Remove the distributor cap, with the wires attached and remove the distributor.
4. Remove the fan shroud and fan.
5. Disconnect and tag the alternator wiring and remove the alternator.
6. Disconnect the air injection pipes from the engine.
7. Remove the fan pulley, hub and bracket.
8. If equipped, remove the air conditioning compressor drive belt.

9. If equipped, remove the power steering pump drive belt.

10. Remove the crankshaft pulley and baffle plate.

11. Remove the upper and lower timing belt covers.

12. Turn the crankshaft so that the A mark on the camshaft pulley is at the top, aligned with the notch in the front housing.

13. Loosen the timing belt tensioner lock bolt and remove the tensioner spring.

14. Mark the forward rotation of the belt for installation. Remove the belt.

15. Unbolt and remove the front housing.

16. Carefully, drive the camshaft seal from the housing.

To install:

17. Coat the outside of a new seal with clean engine oil and press it into place in the front housing.

18. Coat the seal lip with clean engine oil. Install the front housing, using a new gasket. Torque the bolts to 14-19 ft. lbs.

19. Replace the timing belt if it has been contaminated by oil or grease, or shows any sign of damage, wear, cracks or peeling.

20. To ease installation of the belt, remove all the spark plugs.

21. Make sure that the timing mark on the camshaft is aligned and that the timing mark (notch) on the crankshaft sprocket is aligned with the triangular shaped mark on the front housing.

22. Install the tensioner and spring, positioning the tensioner all the way to the intake manifold side and temporarily secure it there with the lock bolt.

23. Install the belt onto the sprockets from the right side. If the original belt is being reused, follow the directional mark previously made.

24. Loosen the lock bolt so that the tensioner applies tension to the belt.

25. Turn the crankshaft 2 full revolutions in the direction of normal rotation. This will apply equal tension to all points of the belt.

26. Make sure that the timing marks are still aligned. If not, repeat the belt installation procedure.

27. Tighten the tensioner lock bolt to 30-35 ft. lbs.

28. Measure the timing belt tension by pressing on the belt at the midpoint of the longest straight run. Belt deflection should be 11-13mm. If not, repeat the belt adjustment procedure, above.

29. Installation of all other parts is the reverse of removal. Torque the belt cover bolts to 80 inch lbs.; the fan bracket bolts to 40 ft. lbs. When installing the drive belts on the various accessories, check the belt deflection.

Timing belt and components—2954cc engine

Timing sprocket alignments—2954cc engine

2954cc Engine

1. Position the engine at TDC on the compression stroke.

2. Properly relieve the fuel system pressure. Disconnect the negative battery cable.

3. Remove the air cleaner assembly. Drain the cooling system and remove the spark plug wires.

4. Remove the fresh air duct assembly. Remove the cooling fan and radiator cowl. Remove the drive belts.

5. Remove the air conditioning compressor idler pulley. If necessary, remove the compressor and position it to the side.

6. Remove the crankshaft pulley and baffle plate. Remove the coolant bypass hose. Remove the upper radiator hose.

7. Remove the timing belt cover assembly retaining bolts. Remove the timing belt cover assembly and gasket. Turn the crankshaft to align the mating marks of the pulleys.

8. Remove the upper idler pulley. Remove the timing belt. If reusing the belt be sure to mark the direction of rotation. Remove the timing belt auto tensioner.

To install:

9. To install the timing belt, first the automatic tensioner must be loaded. To load the tensioner, place a flat washer on the bottom of the tensioner body to prevent damage to the body and position the unit on an arbor press. Press the rod into the tensioner body. Do not use more than 2000 lbs of pressure. Once the rod is fully inserted into the body, insert a suitable L shaped pin or a small Allen wrench through the body and the rod to hold the rod in place.

10. Remove the unit from the press and install onto the block and torque the mounting bolt to 14-19 ft. lbs. Leave the pin in place, it will be removed later.

11. Make sure that all the timing marks are aligned properly. With the upper idler pulley removed, hang the timing belt on each pulley. Install the upper idler pulley and torque the mounting bolt to 27–38 ft. lbs.

12. Rotate the crankshaft twice in the normal direction of rotation to align all the timing marks.

13. Make sure all the marks are aligned correctly. If not, repeat Step 8.

14. Remove the pin from the auto tensioner. Again turn the crankshaft twice in the normal direction of rotation and make sure that all the timing marks are aligned properly.

15. Check the timing belt deflection by applying 22 lbs. of force. If the deflection is not 0.20–0.28 in. (5–6mm), repeat the adjustment procedure.

NOTE: Excessive belt deflection is caused by auto tensioner failure or an excessively stretched timing belt.

16. Complete the installation of the remaining components in reverse of the removal procedure. Fill the cooling system to the proper level. Adjust the accessory drive belt tension. Check and/or adjust the ignition timing.

Camshaft

REMOVAL & INSTALLATION

1998cc and 2184cc Engines

1. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Remove the distributor.

4. Remove the fan shroud and fan.

5. Remove the alternator.

6. Disconnect the air injection pipes.

7. Remove the fan pulley, hub and bracket.

8. If equipped, remove the A/C compressor and power steering drive belts.

9. Remove the crankshaft pulley and baffle plate.

10. Remove the upper and lower timing belt covers.

12. Turn the crankshaft so that the **A** mark on the camshaft pulley is at the top, aligned with the notch in the front housing.

13. Loosen the tensioner lock bolt and remove the tensioner spring.

14. Mark the forward rotation of the belt for installation. Remove the belt.

15. Insert a bar through the hole in the camshaft sprocket to hold it in position and remove the sprocket bolt.

16. Disconnect the accelerator cable, if necessary.

17. If equipped, disconnect the air bypass valve cable.

18. Disconnect the spark plug wires. Remove the wires from the spark plug wire clips on the rocker covers and position them out of the way.

19. Remove the rocker cover and discard the gasket.

20. Remove the rocker arm shaft attaching bolts evenly in the correct order and remove the rocker arm shafts.

21. Remove the camshaft rear seal cap.

22. Lift out the camshaft.

23. Inspect the camshaft for wear, heat scoring or obvious damage. Replace it if necessary. Check the lobes and journals for wear.

To install:

24. Coat the camshaft with clean engine oil and install it in position, making sure that the lug on the nose of the shaft is at the 12:00 o'clock position.

25. Apply a thin coat of sealant to the areas shown and install the rocker shaft assembly. Torque the bolts evenly, in the order shown, to 15–20 ft. lbs. Install the camshaft sprocket. Torque the camshaft sprocket bolt to 40–45 ft. lbs.

26. Replace the belt if it has been contaminated by oil or grease, or shows any sign of damage, wear, cracks or peeling.

27. To ease installation of the belt, remove all the spark plugs.

28. Make sure that the timing mark on the camshaft is aligned as described above, and that the timing mark (notch) on the crankshaft sprocket is aligned with the triangular shaped mark on the front housing.

29. Install the tensioner and spring, positioning the tensioner all the way to the intake manifold side and temporarily secure it there with the lock bolt.

30. Install the belt onto the sprockets from the right side. If the original belt is being reused, follow the directional mark previously made.

31. Loosen the lock bolt so that the tensioner applies tension to the belt.

32. Turn the crankshaft 2 full revolutions in the direction of normal rotation. This will apply equal tension to all points of the belt.

33. Make sure that the timing marks are still aligned. If not, repeat the belt installation procedure.

34. Tighten the tensioner lock bolt to 30–35 ft. lbs.

35. Measure the timing belt tension by pressing on the belt at the midpoint of the longest straight run. Belt deflection should be 11–13mm. If not, repeat the belt adjustment procedure, above.

36. Check the valve adjustment and reset, if necessary.

37. Clean the mating surfaces of the cylinder head and rocker cover.

39. Install the rocker cover with a new gasket. Torque the bolts to 24–36 inch lbs.

40. Install the spark plug wire on the plugs. Place the wires in the clips on the rocker cover. Connect the choke and air bypass valve cable.

41. Installation of all other parts is the reverse of removal. Torque the belt cover bolts to 80 inch lbs.; the fan bracket bolts to 40 ft. lbs.

41. The remainder of the installation is the reverse of the removal procedure.

2555cc and 2606cc Engines

The camshaft on these engines is removed with the rocker shaft assemblies.

1. Disconnect the negative battery cable. Relieve the fuel system pressure.

2. Remove the valve cover assembly.

3. Remove the rocker arms and shafts.

4. Lift the camshaft from the cylinder head.

5. Installation is the reverse of removal.

2954cc Engine

1. Relieve the fuel system pressure. Disconnect the negative battery cable. Remove the cylinder heads from the engine.

2. Engage the camshaft sprocket with a suitable holding tool and loosen the retaining bolt. Pull the sprocket from the end of the camshaft.

3. Insert the end of a flat tipped prybar between the camshaft oil seal and gently pry the seal from the cylinder head bore. Be careful not to damage the seal bore. Discard the seal.

4. Loosen the rocker arm shaft retaining bolts. Loosen the bolts gradually and in several stages. Remove the rocker arm and shaft assemblies.

NOTE: Do not remove the hydraulic lash adjusters unless it is absolutely necessary to do so. The lash adjusters are sealed in the rocker arms by an O-ring. If this O-ring is disturbed or damaged, the lash adjusters may leak. If they are removed, make sure that a new O-ring(s) is installed and that the oil reservoirs in the rocker arms are filled with clean engine oil.

5. Measure the camshaft endplay, this will determine if the thrust plate or the camshaft have to be replaced.

6. Remove the thrust plate and slowly and carefully withdraw the camshaft from the cylinder head.

Clean off the lobe and journal surfaces and proceed to the inspection section.

To install:

7. Apply a liberal coating of clean engine oil to the surfaces of the cam lobes, bearing and journal surfaces. Slowly and carefully insert the camshaft into the cylinder head. Install the camshaft thrust plate and torque the retaining bolt to 6–8 ft. lbs.

8. Wipe down the surface of the seal bore with a clean rag and coat the lip of the new oil seal with clean engine oil. Install the seal into the cylinder head using a socket or a length of pipe that closely approximates the diameter of the seal as an installation tool. Tap the seal evenly into the seal bore.

9. Coat the surfaces of the rocker arm and the rocker arm shafts with clean engine oil. Install the rocker shafts in their original positions. The intake side shaft has twice as many oil holes as the exhaust side. Torque the rocker shaft bolts to 14–19 ft. lbs. in the proper sequence in several stages. When tightening the rocker shaft bolts, make sure the rocker arm shaft spring does not get pinched between the shaft and the mounting boss.

10. Complete the installation of the cylinder head by reversing the removal procedure.

Silent Shafts

REMOVAL & INSTALLATION

2555cc and 2606cc Engines

1. Disconnect the negative battery cable. Relieve the fuel system pressure.

2. Drain the radiator and remove it from the vehicle.

3. Remove the cylinder head.

4. Remove the cooling fan, spacer, water pump pulley and belt.

5. Remove the alternator. Remove the water pump.

6. Raise and support the vehicle safely. Drain the engine oil.

7. Remove the oil pan and screen. Remove the crankshaft pulley.

8. Remove the timing case cover.

9. Remove the chain guides from the front chain.

10. Remove the locking bolts from the chain sprockets.

11. Remove the crankshaft sprocket, silent shaft sprocket and the outer chain.

12. Remove the crankshaft and camshaft sprockets and the timing chain.

13. Remove the camshaft sprocket holder and the chain guides, both left and right.

14. Remove the tensioner.

15. Remove the sleeve from the oil pump. Remove the oil pump by first

removing the bolt locking the oil pump driven gear and the right silent shaft, then remove the oil pump mounting bolts. Remove the silent shaft from the engine block.

NOTE: If the bolt locking the oil pump and the silent shaft is hard to loosen, remove the oil pump and the shaft as a unit.

16. Remove the left silent shaft thrust washer and remove the shaft from the engine block.

17. Install the right silent shaft into the engine block.

18. Install the oil pump assembly. Do not lose the woodruff key from the end of the silent shaft. Torque the oil pump mounting bolts to 6–7 ft. lbs.

19. Tighten the silent shaft and the oil pump driven gear mounting bolt.

NOTE: The silent shaft and the oil pump can be installed as a unit, if necessary.

20. Install the left silent shaft into the engine block.

21. Install a new O-ring on the thrust plate and install the unit into the engine block, using a pair of bolts without heads, as alignment guides.

NOTE: If the thrust plate is turned to align the bolt holes, the O-ring may be damaged.

22. Remove the guide bolts and install the regular bolts into the thrust plate and tighten securely.

23. Rotate the crankshaft to bring No. 1 piston to TDC.

24. Install the cylinder head.

25. Install the sprocket holder and the right and left chain guides.

26. Install the tensioner spring and sleeve on the oil pump body.

27. Install the camshaft and crankshaft sprockets on the timing chain, aligning the sprocket punch marks to the plated chain links.

28. While holding the sprocket and chain as a unit, install the crankshaft sprocket over the crankshaft and align it with the keyway.

29. Keeping the dowel pin hole on the camshaft in a vertical position, install the camshaft sprocket and chain on the camshaft.

NOTE: The sprocket timing mark should be at the 2–3 o'clock position when correctly installed. The chain must be aligned in the right and left chain guides with the tensioner pushing against the chain. The tension for the inner chain is predetermined by spring tension.

30. Install the crankshaft sprocket for the outer chain.

31. Install the 2 silent shaft sprockets and align the punched mating marks with the plated links of the chain.

32. Holding the 2 shaft sprockets and chain, install the outer chain in alignment with the mark on the crankshaft sprocket. Install the shaft sprockets on the silent shaft and the oil pump driver gear. Install the lock bolts and recheck the alignment of the punch marks and the plated links.

33. Temporarily install the chain guides, side (A), top (B) and bottom (C).

34. Tighten side (A) chain guide securely.

35. Tighten bottom (B) chain guide securely.

36. Adjust the position of the top (B) chain guide, after shaking the right and left sprockets to collect any chain slack, so that when the chain is moved toward the center, the clearance between the chain guide and the chain links will be approximately $\frac{9}{64}$ inch. Tighten the top (B) chain guide bolts.

37. Install the timing chain cover using a new gasket, being careful not to damage the front seal.

38. Using a new gasket, install the oil screen and oil pan. Torque the bolts to 4.5–5.5 ft. lbs.

39. Install the crankshaft pulley, alternator and accessory belts and the distributor.

40. Install the oil pressure switch, if removed. Connect the negative battery cable.

41. Install the fan blades, radiator, fill the cooling system and run the engine. Check for oil and water leaks.

Piston and Connecting Rod

POSITIONING

Install the piston with the oil flow port and the arrow facing the front of the engine—2555cc and 2606cc engines

Install the pistons with the L and R marks facing the front of the engine—2954cc engine

Install the piston with the F mark facing the front of the engine—1998cc and 2184cc engines

ENGINE LUBRICATION

Oil Pan

REMOVAL & INSTALLATION

Except 2954cc Engine

1. Disconnect the negative battery cable.
2. Raise and support the vehicle safely. Drain the engine oil.
3. On 4WD models, remove the skid plate.
4. Support the front of the engine near the crankshaft pulley.
5. Remove the crossmember.
6. Remove the cotter pin and nut. Using a puller, disconnect the idler arm from the center link.
7. Remove the engine mount gusset plates from the sides of the engine.
8. Remove the bell housing front cover.
9. Remove the oil pan retaining bolts and remove the oil pan.

To install:

10. Clean all the gasket surfaces.
11. Clean the oil pan, oil pump pick-up tube and oil pump screen.
12. Install a new oil pan gasket coated with oil resistant sealer. Tighten the pan bolts to 5–9 ft. lbs.

13. The remainder of the installation is the reverse of the removal procedure. Torque the idler arm nut to 25–30 ft. lbs. and the bell housing cover to 15–20 ft. lbs.

2954cc Engine

1. Disconnect the negative battery cable. Raise and support the vehicle safely.
2. Drain the engine oil and the cooling system
3. Remove the engine under cover.
4. Remove the oil pan retaining bolts.
5. With a scraper or suitable prying tool, separate the oil pan from the block and remove it. Some oil pans may or may not have a gasket.

NOTE: Be careful not to bend the oil pan when separating it from the block.

6. On oil pans with a gasket, apply sealer to the joints between the front cover and the block and the rear main seal housing and the block. On gasketless oil pans, apply a continuous bead of sealant to the oil pan flange around the inside of the bolt holes and overlap the ends.

7. Raise the oil pan onto the block and install the retaining bolts. Torque the bolts to 69–95 inch lbs.

8. Install the engine undercover and lower the vehicle. Fill the crankcase to the proper level. Start the engine and check for leaks.

Oil Pump

REMOVAL & INSTALLATION

1998cc and 2184cc Engines

1. Disconnect the negative battery cable.
2. Drain the cooling system.
3. Remove the distributor.
4. Remove the fan shroud and fan.
5. Remove the alternator.
6. Disconnect the air injection pipes.
7. Remove the fan pulley, hub and bracket.
8. If equipped, remove the air conditioning compressor drive belt.
9. If equipped, remove the power steering pump drive belt.
10. Remove the crankshaft pulley and baffle plate.
11. Remove the upper, then the lower, belt covers.
12. Turn the crankshaft so that the **A** mark on the camshaft pulley is at the top, aligned with the notch in the front housing.
13. Loosen the tensioner lock bolt and remove the tensioner spring.
14. Mark the forward rotation of the belt for installation. Remove the belt.
15. Unbolt and remove the crankshaft sprocket.
16. Raise and safely support the vehicle. Drain the engine oil.
17. Remove the skid plate.
18. Support the front of the engine at the crankshaft pulley.

19. Remove the crossmember.
20. Remove the cotter pin and nut and, with a puller, disconnect the idler arm from the center link.
21. Remove the engine mount gusset plates from the sides of the engine.
22. Remove the bell housing front cover.
23. Remove the oil pan.
24. Remove the oil pick-up tube.
25. Remove the oil pump.

To install:

26. Apply a thin coating of grease to the O-ring and install it in its recess in the pump body.
27. Apply a thin bead of RTV silicone sealer to the pump mounting surface.
28. Coat the oil seal lip with clean engine oil and install the pump. Torque the bolts to 14-19 ft. lbs.
29. Clean all the gasket surfaces. Straighten the portion of the pan rim that may be bent.
30. Clean the oil pan, oil pump pick-up tube and oil pump screen.
31. Using a new gasket, install the oil pan on the engine. Tighten the oil pan bolts to 5-9 ft. lbs.
32. Install all other parts in reverse order of removal. Torque the idler arm nut to 25-30 ft. lbs. and the bell housing cover to 15-20 ft. lbs.
33. Replace timing the belt if it has been contaminated by oil or grease, or shows any sign of damage, wear, cracks or peeling.

34. To ease installation of the belt, remove all the spark plugs.
35. Make sure that the timing mark on the camshaft is aligned and that the timing mark (notch) on the crankshaft sprocket is aligned with the triangular shaped mark on the front housing.
36. Install the tensioner and spring, positioning the tensioner all the way to the intake manifold side and temporarily secure it there with the lock bolt.

37. Install the belt onto the sprockets from the right side. If the original belt is being reused, follow the directional mark previously made.

38. Loosen the lock bolt so that the tensioner applies tension to the belt.

39. Turn the crankshaft 2 full revolutions in the direction of normal rotation. This will apply equal tension to all points of the belt.

40. Make sure that the timing marks are still aligned. If not, repeat the belt installation procedure.

41. Tighten the tensioner lock bolt to 30-35 ft. lbs.

42. Measure the timing belt tension by pressing on the belt at the midpoint of the longest straight run. Belt deflection should be 11-13mm. If not, repeat the belt adjustment procedure.

Oil pump and pan removal - 1998cc and 2184cc engines

43. The remainder of the installation is the reverse of the removal procedure. Torque the timing belt cover bolts to 80 inch lbs. and the fan bracket bolts to 40 ft. lbs. When installing the drive belts on the various accessories, check the belt deflection.

2555cc and 2606cc Engines

1. Disconnect the negative battery cable. Relieve the fuel system pressure.
2. Drain the radiator and remove it from the vehicle.
3. Remove the cylinder head.
4. Remove the cooling fan, spacer, water pump pulley and belt.
5. Remove the alternator. Remove the water pump.
6. Raise and support the vehicle safely. Drain the engine oil.
7. Remove the oil pan and screen. Remove the crankshaft pulley.
8. Remove the timing case cover.
9. Remove the chain guides from the outer chain.
10. Remove the locking bolts from the chain sprockets.

11. Remove the crankshaft sprocket, silent shaft sprocket and the outer chain.

12. Remove the crankshaft and camshaft sprockets and the timing chain.

13. Remove the camshaft sprocket holder and the chain guides, both left and right.

14. Remove the tensioner.

15. Remove the sleeve from the oil pump. Remove the oil pump by first removing the bolt locking the oil pump driven gear and the right silent shaft, then remove the oil pump mounting bolts.

To install:

16. Install the oil pump assembly. Do not lose the woodruff key from the end of the silent shaft. Torque the oil pump mounting bolts to 6-7 ft. lbs.

17. Tighten the silent shaft and the oil pump driven gear mounting bolt.

NOTE: The silent shaft and the oil pump can be installed as a unit, if necessary.

1. Air cleaner
2. Cooling fan
3. Drive belt
4. Water pump pulley
5. Radiator hose
6. Water bypass hose
7. Water pump and gasket
8. Crankshaft pulley
9. Alternator strap
10. Alternator

11. Cylinder head cover
12. Chain cover bolts
13. Timing chain cover and gaskets
14. Left balance shaft sprocket bolts
15. Oil pump drive sprocket bolt
16. Right balance shaft sprocket bolt

17. Chain guide A
18. Chain guide B
19. Chain guide C
20. Oil pump and balance shaft sprocket and chain
21. Oil pump assembly
22. Chain tensioner
23. Gasket
24. Oil pump cover
25. Drive gear
26. Driven gear

Exploded view of the oil pump and related components—2555cc and 2606cc engines

18. Install the left silent shaft into the engine block.

19. Install a new O-ring on the thrust plate and install the unit into the engine block, using a pair of bolts without heads, as alignment guides.

NOTE: If the thrust plate is turned to align the bolt holes, the O-ring may be damaged.

20. Remove the guide bolts and install the regular bolts into the thrust plate and tighten securely.

21. Rotate the crankshaft to bring No. 1 piston to TDC.

22. Install the cylinder head.

23. Install the sprocket holder and the right and left chain guides.

24. Install the tensioner spring and sleeve on the oil pump body.

25. Install the camshaft and crankshaft sprockets on the timing chain, aligning the sprocket punch marks to the plated chain links.

26. While holding the sprocket and chain as a unit, install the crankshaft

sprocket over the crankshaft and align it with the keyway.

27. Keeping the dowel pin hole on the camshaft in a vertical position, install the camshaft sprocket and chain on the camshaft.

NOTE: The sprocket timing mark and the plated chain link should be at the 2-3 o'clock position when correctly installed. The chain must be aligned in the right and left chain guides with the ten-

sioner pushing against the chain. The tension for the inner chain is predetermined by spring tension.

28. Install the crankshaft sprocket for the outer chain.

29. Install the 2 silent shaft sprockets and align the punched mating marks with the plated links of the chain.

30. Holding the 2 shaft sprockets and chain, install the outer chain in alignment with the mark on the crankshaft sprocket. Install the shaft sprockets on the silent shaft and the oil pump driver gear. Install the lock bolts and recheck the alignment of the punch marks and the plated links.

31. Temporarily install the chain guides.

32. Tighten side chain guide securely.

33. Tighten bottom chain guide securely.

34. Adjust the position of the top chain guide, after shaking the right and left sprockets to collect any chain slack, so that when the chain is moved toward the center, the clearance between the chain guide and the chain links will be approximately $\frac{9}{64}$ inch. Tighten the top chain guide bolts.

35. Install the timing chain cover using a new gasket, being careful not to damage the front seal.

36. Using a new gasket, install the oil screen and oil pan. Torque the bolts to 4.5–5.5 ft. lbs.

37. Install the crankshaft pulley, alternator and accessory belts and the distributor.

38. Install the oil pressure switch, if removed. Connect the negative battery cable.

39. Install the fan blades and radiator. Fill the cooling system and run the engine. Check for oil and water leaks.

40. Adjust the ignition timing.

2954cc Engine

1. Disconnect the negative battery cable. Raise and support the vehicle safely.

2. Drain the engine oil and the cooling system.

3. Remove the timing belt and the timing belt pulley and key. Remove the thermostat and gasket.

4. Remove the oil pan, oil strainer and O-ring.

5. Unbolt and remove the oil pump and gasket.

6. To install, press in a new oil seal and coat the seal lip with clean engine oil. Use a new gasket, O-ring and sealant as required. Torque the oil pump retaining bolts to 14–19 ft. lbs.

CHECKING

Side Clearance

Lay a straightedge across the pump body and, using a feeler gauge, measure between the gear faces and straightedge. If the clearance exceeds 0.10mm (0.003937 in.), replace the pump.

Outer Gear-to-Pump Body Clearance

Insert a feeler gauge between the outer gear and the pump body. If the clearance exceeds 0.20mm (0.00787 in.), replace the gear or pump body.

Rear Main Oil Seal

REMOVAL & INSTALLATION

1998cc and 2184cc Engines

1. Raise and safely support the vehicle. Remove the transmission.

2. On manual transmission equipped vehicles, remove the clutch assembly.

3. Remove the flywheel or drive plate.

4. Remove the end plate.

5. The seal is located in the rear cover. Remove the rear cover. Discard the gasket.

6. Place the cover on a hard, flat surface. Drive the old seal from the rear cover.

7. Apply clean engine oil to the outer rim of the new seal and the seal bore in the rear cover. Press the new seal into place.

8. Coat the seal lip with clean engine oil. Install the rear cover and new gasket. Torque the bolts to 72–102 inch lbs., (6–8.5 ft. lbs.).

9. Using a suitable tool, cut away the part of the gasket that projects below the rear cover.

10. Install the end plate. Torque the bolts to 14–22 ft. lbs.

11. On manual transmission models, install the flywheel, clutch and transmission. On automatic transmission models, install the drive plate and transmission.

12. The remainder of the installation is the reverse of the removal procedure.

2555cc and 2606cc Engines

NOTE: The rear main bearing oil seal is located in a housing on the rear of the engine. To replace the seal, remove the transmission and work from underneath the vehicle.

1. Raise and safely support the vehicle. On manual transmission mod-

els, remove the transmission, clutch and flywheel. On automatic transmission models, remove the transmission and flywheel. Remove the oil seal housing from the rear of the engine.

2. Remove the separator from the housing.

3. Pry out the old seal.

4. Lightly oil the replacement seal. The oil seal should be installed so that the seal plate fits into the inner contact surface of the seal case. Install the separator with the oil holes facing down.

5. Install the flywheel, clutch and transmission. Check the engine oil level when finished.

2954cc Engine

1. Raise and support the vehicle safely. Remove the transmission from the vehicle.

2. If equipped with manual transmission, remove the clutch pressure plate and flywheel.

3. If equipped with automatic transmission, remove the flywheel assembly.

4. Drain the engine oil.

5. Remove the rear main seal cover retaining bolts. Remove the rear main seal cover. Remove the seal from the rear cover.

6. Installation is the reverse of the removal procedure. Apply clean engine oil to the seal before pressing it into the cover.

7. After installing the rear cover cut away the portion of the gasket that projects out toward the oil pan side.

MANUAL TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transmission Assembly

REMOVAL & INSTALLATION

B2000 and B2200

1. Disconnect the negative battery cable.

2. Remove the gearshift knob and shift console attaching screws. Remove the console.

3. Remove the shift lever to extension housing attaching bolts and re-

move the shift lever.

4. Raise and support the vehicle safely.

5. Drain the transmission oil.

6. Matchmark and remove the driveshaft.

7. Disconnect the speedometer cable from the transmission.

8. Remove the starter motor.

9. Disconnect and tag the back-up light switch wiring at the transmission.

10. Disconnect the parking brake return spring and parking brake cables.

11. Remove the clutch slave cylinder.

12. Remove the transmission front support bracket.

13. Disconnect the exhaust pipe at the transmission and manifold.

14. Support the transmission and engine separately.

15. Remove the transmission crossmember.

16. Lower the transmission to gain access to the top bolts and remove the transmission to engine bolts.

17. Pull the transmission straight back, away from the engine and remove transmission from the vehicle.

18. Installation is the reverse of the removal procedure.

20. Torque the transmission to engine bolts to 60–65 ft. lbs. and the gearshift lever bolts to 6–8 ft. lbs.

21. Check and fill the transmission to the proper level when finished.

B2600

NOTE: Although the transmission and transfer case are separate units, they share a similar mounting and sealing surface. It is recommended that they be removed as a unit and separated once removed from the vehicle.

1. Disconnect the negative battery cable.

2. Remove the knobs from the transfer case and transmission shifters.

3. Remove the console box, if equipped.

4. Remove the insulator plate and shifter boot.

5. Remove the shift levers.

6. Raise and support the vehicle safely. Drain the transfer case and transmission oil.

7. Remove the transmission and transfer case under covers. Remove the starter.

8. Disconnect and remove the exhaust pipe from the manifold and catalytic converter.

9. Matchmark and remove the front and rear driveshafts.

10. Disconnect the speedometer cable, 4WD switch and backup light switch wires from the

transmission/transfer case.

11. Remove the slave cylinder without disconnecting the fluid line. Support the slave cylinder out of the way.

12. Remove the transmission/transfer case gusset plates. Support the transmission. Properly support the engine.

13. Raise the transmission/transfer case and remove the crossmember.

14. Remove the transmission and transfer case as an assembly.

15. Installation is the reverse of the removal procedure.

16. Align the matchmarks on the driveshafts during installation.

17. Check and fill the transmission and transfer case after installation.

MPV

1. Disconnect the battery ground cable.

2. Raise and support the vehicle safely.

3. Drain the transmission fluid.

4. Remove the shifter knob and boot.

5. Shift the transmission into N and unbolt and remove the shifter.

6. Disconnect the speedometer cable at the extension housing.

7. Disconnect the electrical connectors at the transmission.

8. Matchmark and remove the driveshaft. Stuff a rag in the double offset joint to prevent damage to the boot from the driveshaft.

9. On the 2606cc engine, unbolt the transmission side support plate from the transmission.

10. Remove the starter.

11. Remove the clutch release cylinder and hydraulic line bracket. It is not necessary to disconnect the hydraulic line. Remove the bellhousing inspection plate.

12. Disconnect the exhaust pipe at both the engine and the support bracket.

13. Remove the converter heat shield. Remove the side support plates and support the transmission with a transmission jack.

14. Remove the transmission-to-crossmember bolts. Remove the crossmember.

15. Support the engine with a suitable jack. Remove the transmission-to-engine bolts.

16. Pull the transmission straight back on the jack until the mainshaft clears the clutch. Lower the transmission and pull it out from under the vehicle.

To install:

17. Raise the unit and position it under the vehicle.

18. Push the transmission straight forward on the jack until the mainshaft enter the clutch and the

transmission engages the locating studs on the engine.

19. Install the transmission-to-engine bolts. Torque the bolts to 45 ft. lbs.

20. Install the starter. Install the crossmember. Torque the bolts to 50 ft. lbs.

21. Install the transmission-to-crossmember bolts. Torque the bolts to 45 ft. lbs. Remove the engine support. Remove the transmission jack.

22. Connect the exhaust pipe at both the engine and the support bracket.

23. Install the transmission side support plate. Install the clutch release cylinder and bracket.

24. Connect the speedometer cable at the extension housing. Connect the electrical wiring.

25. Install the driveshaft. Install the bellhousing inspection plate.

26. Install the heat shield and install the shifter.

27. Install the floor console. Install the shifter knob and boot.

28. Fill the transmission with fluid.

29. Connect the battery ground cable.

CLUTCH

Clutch Assembly

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the transmission. If the clutch is being reused, matchmark the pressure plate to the flywheel to insure proper balance during installation.

2. Loosen the bolts holding the clutch cover to the flywheel. Loosen the bolts evenly a turn or 2 at a time.

3. Support the clutch assembly and remove the mounting bolts. Remove the clutch disc.

4. Using a clutch alignment tool, install the pressure plate and disc on the flywheel.

5. Install the clutch-to-flywheel bolts.

6. Tighten the bolts evenly a few turns at a time.

7. Torque the bolts to 13–20 ft. lbs.

8. Remove the alignment tool.

9. Apply a light film of lubricant to the release bearing, release lever contact area on the release bearing hub and input shaft bearing retainer.

10. Install the transmission.

11. Check the operation of the clutch and if necessary, adjust the pedal free-play and the release lever.

Pedal Height/Free-Play Adjustment

1. Measure the distance from the top of the clutch pedal pad to the carpet.

2. The measurement for the pedal height, should be approximately 208–218mm.

3. If the measurement is not within specification, adjust the pedal by loosening and turning the clutch switch in the bracket.

4. Check the free-play by pressing the pedal by hand until resistance is felt.

5. Measure the distance, it should be 5.5–17.4mm.

6. If the distance is not within specification, loosen the locknut on the actuator rod and turn the actuator rod until the measurement is correct.

7. Recheck the measurement. Tighten the locknut.

- A. Locknut
- B. Stopper
- C. Locknut
- D. Pushrod

Clutch pedal height and free-play adjustment points

Clutch Master Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Disconnect and plug the fluid outlet line at the fitting on the master cylinder.

2. Remove the nuts and bolts mounting the master cylinder to the firewall.

3. Remove the master cylinder from the firewall.

- 1. Snapring
- 2. Piston and secondary cup assembly
- 3. Protector
- 4. Primary cup
- 5. Return spring
- 6. Tank cap and baffle
- 7. Reservoir tank
- 8. Bushing
- 9. Joint bolt
- 10. One-way valve piston
- 11. Spring
- 12. One-way valve pin
- 13. Cylinder body

Exploded view of the clutch master cylinder

Exploded view of the clutch slave cylinder

4. Start the pedal pushrod into the master cylinder and position the master cylinder on the firewall.

5. Install the mounting nuts and bolts. Torque the nuts to 12-17 ft. lbs.

6. Connect the fluid outlet line to the master cylinder fitting.

7. Bleed the hydraulic clutch system.

8. Check the clutch pedal free-play and adjust if necessary.

Clutch Slave Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and support the vehicle safely.

2. Disconnect the fluid line from the slave cylinder.

3. Pull off the hose retaining clip and remove the hose from the bracket. Cap the pipe to prevent fluid loss.

4. Remove the slave cylinder.

5. Installation is the reverse of removal.

6. Torque the slave cylinder mounting bolt to 12-17 ft. lbs.

7. Bleed the clutch system when finished.

BLEEDING THE CLUTCH

1. To bleed the system, remove the rubber cap from the bleeder valve and attach a rubber hose to the valve.

2. Submerge the other end of the hose in a large jar of clean brake fluid.

3. Open the bleeder valve. Depress the clutch pedal and allow it to return slowly.

4. Continue slowly pumping clutch pedal and watch the jar of brake fluid.

5. When the fluid is clear of air bubbles, close the bleeder valve and re-

move the tube.

6. Check and fill the reservoir during and after the procedure.

NOTE: If the fluid in the reservoir runs out during the procedure, the entire procedure must be repeated. After the bleeding operation is finished, install the cap on the bleeder valve and fill the master cylinder to the proper level. Always use fresh DOT 3 brake fluid. Do not use the fluid that was in the jar for bleeding, since it may contain air and/or dirt.

AUTOMATIC TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transmission Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Raise and support the vehicle safely.

3. Drain the transmission fluid. After the fluid has drained, install a few bolts to hold the pan in place, temporarily.

4. Remove the exhaust pipe bracket bolt from the right side of the convert-

er housing.

5. Remove the exhaust pipe flange bolts from the rear of the resonator or catalytic converter and disconnect the pipe.

6. Matchmark and remove the driveshaft from the rear axle flange.

7. Remove the driveshaft center bearing support. Lower the driveshaft and remove it from the transmission.

8. Disconnect the speedometer cable.

9. Disconnect the shift rod from the manual lever.

10. Remove the vacuum hose from the diaphragm. Disconnect the electrical connectors from the downshift solenoid and inhibitor switch and remove their wires from the clip.

11. Disconnect and plug the cooler lines from the radiator at the transmission.

12. Remove the access cover from the lower front of the converter housing.

13. Matchmark the drive plate (flywheel) and torque converter for reassembly. Remove the 4 bolts holding the torque converter to the drive plate.

14. Remove the bolts connecting the crossmember to the transmission.

15. Support the transmission. Remove the crossmember to frame bolts and remove the crossmember. Properly support the engine.

16. Make sure that the transmission is securely supported.

17. Lower the transmission enough to remove the starter.

18. Remove the converter housing to engine bolts.

19. Remove the fluid filler tube.

20. Make sure that the converter is engaged in the transmission during removal.

21. Lower the transmission and converter as an assembly. Be careful not to let the converter fall out.

To install:

22. To install, make sure that the converter is properly installed in the transmission.

23. Raise the transmission into place. Install the converter housing to engine bolts and torque the bolts in 2 stages to 23–34 ft. lbs.

24. Lower the transmission slightly and install the starter.

25. Install the fluid filler tube with a new O-ring.

26. Raise the transmission slightly and install the crossmember to the frame. Tighten the bolts to 23–34 ft. lbs.

27. Lower the transmission and install the transmission to crossmember bolts. Tighten to 23–34 ft. lbs.

28. Align the matchmarks made earlier on the torque converter and drive plate. Install the 4 attaching bolts and torque to 25–36 ft. lbs. in 3 stages.

29. Install the access cover. Remove the support.

30. Connect the cooler lines.

31. Install the electrical connectors to the switch and solenoid and replace the wires in the clip. Install the diaphragm vacuum hose.

32. Connect the shift rod to the lever.

33. Connect the speedometer cable.

34. Insert the driveshaft into the transmission. Install the center bearing support. Bolt the driveshaft to the rear of the axle flange.

35. Connect the exhaust pipe to the catalytic converter, using a new gasket. Reinstall the exhaust pipe clamp onto the converter housing and torque the bolt to 10–15 ft. lbs.

36. Install a new pan gasket and the fluid pan.

37. Lower the vehicle. Connect the negative battery cable. Fill the transmission through the dipstick tube with the specified fluid, being careful not to overfill. Run the engine and check for leaks.

SHIFT LINKAGE ADJUSTMENT

1. Put the gearshift lever in N.

2. Raise and support the vehicle.

3. Disconnect the clevis from the lower end of the selector lever operating arm.

4. Move the transmission manual lever to N, the 3rd detent position from the rear of the transmission.

5. Loosen the 2 clevis retaining nuts and adjust the clevis so that it freely enters the hole of the lever. Tighten the retaining nuts to secure the adjustment.

6. Connect the clevis to the lever and attach it with the spring washer,

flat washer and retaining clip.

7. Lower the vehicle and check the operation of the transmission in all gears.

KICKDOWN SWITCH ADJUSTMENT

1. Turn the ignition switch to the ON position.

2. Loosen the kickdown switch attaching nut (the switch is located just above the accelerator pedal) and adjust the switch to engage when the accelerator pedal is depressed about $\frac{7}{8}$ of the way. The downshift solenoid will click when the switch engages.

3. Tighten the attaching nut and check the switch for proper operation.

NEUTRAL INTERLOCK ADJUSTMENT

1. Back off the locknut below the handle.

2. Position the shifter in either N or D.

3. Turn in the handle until no play is felt at the interlock button.

4. Turn the handle one additional turn if necessary, to position the button on the driver's side.

5. Depress the button and shift to P. If the lever cannot be moved to P position, turn in the handle an additional turn, repeating the shift move and additional turn, until Park can be engaged smoothly.

6. From this point, shift through the various positions, confirming that the shifter works properly.

7. If the lever can be shifted to R from either P or N, turn out on the handle.

8. When the adjustment is completed, check that the button protrudes 6.0mm from the handle in the N or P position. Recheck the shift pattern.

9. Tighten the locknut to 15 ft. lbs.

NEUTRAL SAFETY SWITCH ADJUSTMENT

1. Check and adjust the transmission linkage.

2. Place the transmission in N (3rd detent from the rear of the transmission).

3. Remove the transmission manual lever retaining nut and lever.

4. Loosen the inhibitor switch attaching bolts. Remove the screw from the alignment pin hole at the bottom of the switch.

5. Rotate the switch and insert an alignment pin, 0.059 in. diameter into the alignment pin hole and internal rotor.

6. Tighten the 2 switch attaching

bolts and remove the alignment pin.

7. Reinstall the alignment pin hole screw in the switch body.

8. Install the manual lever.

9. Check the operation of the switch. The engine should only start with the transmission selector lever in N or P.

TRANSFER CASE

Transfer Case Assembly

REMOVAL & Installation

The transfer case and transmission are connected together and share a common seal between them. It is recommended by the manufacturer that they be removed from the vehicle as an assembly and then separated for repairs.

DRIVE AXLE

Driveshaft and U-Joints

REMOVAL & INSTALLATION

B2000, B2200 and MPV

1. Raise and support the vehicle safely. Matchmark the driveshaft with the rear flange. Remove the bolts attaching the driveshaft to the rear flange and remove the driveshaft.

2. On 2-piece units, remove the center support bearing bracket from the underbody.

3. Pull the driveshaft rearward and out of the transmission.

4. Installation is the reverse of removal. Align the matchmarks made during removal. Torque the rear flange bolts to 39–47 ft. lbs. and the center bearing bracket nuts to 27–38 ft. lbs.

B2600 – Front

1. Raise and support the vehicle safely.

2. Matchmark the driveshaft to the front differential flange.

3. Remove the driveshaft from the differential and top of the transfer case.

4. Installation is the reverse of the removal procedure.

Typical driveshaft types — B2000, B2200 and B2600

5. Torque the mounting bolts to 39–47 ft. lbs.

B2600 — Rear

1. Raise and support the vehicle safely.
2. Matchmark the front and rear flange to the driveshaft.
3. Support the driveshaft.
4. Remove the front and rear driveshaft flange bolts and center bearing mount.
5. Remove the driveshaft and center bearing as an assembly.
6. Installation is the reverse of the removal procedure.
7. Torque the flange bolts to 36–43 ft. lbs and the bearing mount bolts to 27–36 ft. lbs.

Center Bearing**REMOVAL & INSTALLATION****B2600 and MPV**

1. Raise and support the vehicle safely.
2. Matchmark and remove the rear driveshaft.
3. Unbolt and remove the center bearing from the front portion of the rear driveshaft.
4. Install the center bearing on the driveshaft.
5. Install the bearing and driveshaft in the vehicle.
6. Torque the bearing mounting bolts to 27–36 ft. lbs and the flange bolts to 36–43 ft. lbs.

Front Axle Shaft**REMOVAL & INSTALLATION****B2600**

1. Raise and support the vehicle safely. Remove the tire and wheel assembly.
2. Remove the locking hub assembly.
3. Remove the brake caliper and the mount without disconnecting the fluid line. Support the caliper out of the way.
4. Disconnect the stabilizer bar and shock absorber from the lower control arm.
5. Disconnect the tie rod end from the steering knuckle.

6. Remove the circlip and spacer from the hub end of the axleshaft.
7. Support the lower control arm.
8. Remove the upper and lower ball joint cotter pins and nuts.
9. Separate the ball joints from the control arms.
10. Remove the steering knuckle and hub assembly.
11. Remove the engine under cover.
12. Carefully, remove the axleshaft from the differential end. Use care not to damage the oil seal or dust cover.
13. Remove the axleshaft from the vehicle.
14. Installation is the reverse of the removal procedure.

Front Output Shaft Seal and Bearing**REMOVAL & INSTALLATION****B2600**

1. Raise and support the vehicle safely. Remove the left wheel and tire assembly.
2. Remove the left side axle shaft. Remove the output shaft.
3. Remove the O-ring from the retainer. Remove the circlip from the retainer side of the output shaft.

NOTE: The next procedures require the use of a press. Certain adapters must also be used, to remove and install the bearing and seal.

4. Press out the output shaft, bearing and seal assembly from the retainer.
5. Remove the oil seal.
6. Press the bearing off of the output shaft.
7. Clean and inspect the output shaft.
8. Press the oil seal in the retainer using tool 49 M005 796 or equivalent.

Output shaft seal retaining clip location

9. Coat the lip of the oil seal with engine oil.

10. Press the output shaft into the bearing.

NOTE: When pressing the output shaft into the bearing, only support the inner race of the bearing. If an extreme amount of binding occurs, STOP. The output shaft must be pressed into the bearing straight.

11. Press the output shaft and bearing into the retainer.

12. Install the oil seal in the retainer.

13. Install a new circlip on the output shaft at the retainer.

14. Install a new O-ring on the retainer.

15. Install the output shaft into the differential.

16. Install the left side axleshaft.

17. The remainder of the installation is the reverse of the removal procedure.

Rear Axle Shaft, Bearing and Seal

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.

2. Remove the tire and wheel assembly and brake drum.

3. Remove the brake shoes.

4. Remove the parking brake cable retainer.

5. Disconnect and plug the brake lines at the wheel cylinders.

6. Remove the bolts securing the backing plate and bearing housing.

7. Slide the axle shaft from the axle housing. Be careful to avoid damaging the oil seal with the axle shaft.

8. If the seal in the axle housing is damaged in any way, it must be replaced. The seal can be removed using a slide hammer and adapter.

9. Remove 2 of the backing plate bolts, diagonally from each other.

10. Using a grinding wheel, grind down the bearing retaining collar in one spot, until about 5mm remains above the axle shaft. Using a suitable tool, break the collar. Be careful to avoid damaging the shaft.

11. Using a press or puller, remove the hub and bearing assembly from the shaft. Remove the spacer from the shaft.

12. Remove the bearing and seal from the hub.

13. Using a suitable tool, remove the race from the hub.

14. Check all parts for wear or damage.

NOTE: If either race is being replaced, both must be replaced.

15. Remove the race in the axle housing with a slide hammer and adapter.

16. The outer race must be installed using an arbor press. The inner race can be driven into place in the axle housing. Pack the hub with wheel bearing grease.

17. Tap a new oil seal into the axle housing until it is flush with the end of the housing. Coat the seal lip with wheel bearing grease.

18. Install a new spacer on the shaft with the larger flat surface up.

19. Install a new seal in the hub.

20. Thoroughly pack the bearing with clean wheel bearing grease.

21. Place the bearing in the hub and, using a press, press the hub and bearing assembly onto the shaft.

22. Press the new collar onto the shaft. The press pressure for the collar is critical. Press pressures should be 9,240–13,420 lbs. (4,200–6,100 kg).

23. Install one shaft in the housing being very careful to avoid damaging the inner seal.

24. If only one shaft was being serviced, the other must now be removed to check bearing play on the serviced axle. If both shafts were removed, leave the other one out temporarily.

25. Tighten the backing plate bolts on the one installed axle to 80 ft. lbs.

26. Mount a dial indicator on the backing plate, with the pointer resting on the axle shaft flange. Check the axle shaft end play. Standard bearing play should be 0.026–0.037 in. (0.65–0.95mm).

27. If play is not within specifications, shims are available.

28. Install the other shaft and torque the backing plate bolts. Check the play as on the first shaft. Play should be 0.002–0.010 in. If not, correct it with shims.

29. Install the brake drums and wheels. Bleed the brake system.

Front Wheel Hub, Knuckle

REMOVAL & INSTALLATION

2wd Vehicles

1. Raise and safely support the vehicle.

2. Remove the wheels.

3. Remove the brake calipers. Suspend the calipers out of the way with a wire. Don't disconnect the brake line.

4. Remove the hub and bearings.

5. Remove the tie rod-to-knuckle nut, and, using a ball joint separator, remove the tie rod end from the knuckle.

7. Install a spring compressor on the coil spring.

8. Support the lower arm with a floor jack.

9. Remove the cotter pin and nut from the lower ball joint, and, using a ball joint separator, disconnect the lower ball joint from the knuckle.

10. Remove the cotter pin and nut from the upper ball joint, and, using a ball joint separator, disconnect the upper ball joint from the knuckle.

11. Pull the knuckle and spindle assembly from the control arms.

12. The knuckle arm may now be removed.

13. Clean and inspect all parts for wear or damage. Replace parts as necessary.

To install:

14. Secure the knuckle in a vise and install the knuckle arm. Torque the bolts to 70–74 ft. lbs.

15. Installation of the knuckle assembly is the reverse of removal. Observe the following torques:

Upper ball joint-to-knuckle—35–38 ft. lbs.

Lower ball joint-to-knuckle—116 ft. lbs.

Tie rod end-to-knuckle—22–29 ft. lbs.

4wd Vehicles

1. Raise and support the vehicle safely. Remove the tire and wheel assembly.

2. Remove the locking hub assembly.

3. Remove the brake caliper and the mount without disconnecting the fluid line. Support the caliper out of the way.

4. Disconnect the stabilizer bar and shock absorber from the lower control arm.

5. Disconnect the tie rod end from the steering knuckle.

6. Remove the circlip and spacer from the hub end of the axle shaft.

7. Support the lower control arm. Using a puller, remove the hub and rotor assembly from the steering knuckle.

8. Remove the upper and lower ball joint cotter pins and nuts.

9. Separate the ball joints from the control arms.

10. Remove the dust shield. Remove the steering knuckle.

11. Installation is the reverse of the removal procedure. Adjust the wheel bearing when finished.

12. Observe the following torques during installation:

Upper ball joint nut—22–38 ft. lbs.

Lower ball joint nut—87–115 ft. lbs.

Tie rod nut—23–43 ft. lbs.

Brake caliper mount bolts—65–80 ft. lbs.

Locking hub bolts—22–25 ft. lbs.

1. Bearings
2. Hub assembly
3. Oil seal
4. Disc plate
5. Caliper and disc pads assembly
6. Knuckle

Front hub and rotor assembly—2WD vehicles

1. Freewheel hub bolts
2. Snapring
3. Spacer
4. Bearing set plate
5. Locknut
6. Bearing
7. Hub assembly
8. Bearing
9. Oil seal
10. Disc plate
11. Dust cover
12. Knuckle
13. Needle bearing
14. Drive shaft

Front hub and rotor assembly—4WD vehicles

Front Wheel Bearings

REMOVAL & INSTALLATION

4wd Vehicles

1. Raise and support the vehicle safely. Remove the wheel assembly.
2. Remove the locking hub assembly. Remove the disc brake caliper and mount from the spindle, without disconnecting the brake line.
3. Remove the circlip and spacer from in front of the wheel bearing.
4. Remove the bearing set plate and set screw.
5. Using tool 49 S231 635 or its equivalent, remove the bearing lock nut counterclockwise.
6. Remove the hub from the axle shaft.
7. Check the hub for cracks or damage. Check the inner and outer bearings and races for wear.
8. Matchmark the rotor to the hub and, remove the rotor from the hub.
9. Drive out the inner grease seal and bearing race.
10. Drive out the outer bearing race.
11. Clean and inspect the inside of the hub.

To install:

12. Drive in the inner and outer bearing races into the hub. Make sure that they are fully seated in the hub.
13. Thoroughly pack the new wheel bearings in high temperature wheel bearing grease.
14. Install the inner wheel bearing in the hub. Drive the inner grease seal in the hub until it is flush with the surface.
15. Align the matchmarks on the rotor and the hub.
16. Install the hub on the spindle and place the outer wheel bearing in the hub.
17. Install the wheel bearing lock nut and adjust the turning torque of the hub.
18. Attach a spring scale to the wheel stud on the hub. The frictional force required to turn the hub should be 1.3–2.6 lbs.
19. Tighten the wheel bearing lock nut until the reading is correct.
20. The remainder of the installation is the reverse of the removal procedure.

Manual Locking Hubs

REMOVAL & INSTALLATION

4wd Vehicles

1. Raise and safely support the vehicle. Remove the wheel and tire assemblies.
2. Set the locking hub in the **FREE** position.

3. Remove the locking hub mounting bolts and remove the locking hub.

4. With the hub removed, install 2 bolts and nuts opposite each other to hold the hub together.

5. Check for smooth operation of the control handle in both the **FREE** and **LOCK** positions.

6. Check for smooth rotation of the inner hub with the control lever in the **FREE** position.

7. Check for no rotation of the inner hub with the control lever in the **LOCK** position.

8. To install, place the control lever in the **FREE** position.

9. Lightly grease the inner splines of the hub.

10. Install the hub on the vehicle and torque the bolts to 22–25 ft. lbs.

11. Install the wheel assembly and check the operation of the hub.

Pinion Seal

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.
2. Matchmark and remove the driveshaft.
3. Check the turning torque of the

Setting the manual hub to the **FREE** position

Apply grease to the inner hub splines before assembly

Align the tabs on the body with the grooves in the hub

pinion before proceeding. This is the torque that must be reached during installation of the pinion nut.

4. Using pinion flange holding tool, remove the pinion nut and washer.

5. Remove the pinion flange from the pinion gear.

6. Pry the pinion seal out of the differential carrier.

7. Clean and inspect the sealing surface of the carrier and flange.

8. Using a seal driver, drive the new seal into the carrier until the flange on the seal is flush with the carrier.

9. With the seal installed, the pinion bearing preload must be set.

10. Tighten the pinion nut while holding the flange, until the turning torque is the same as before removal of the nut.

11. Align the matchmarks and install the driveshaft.

12. Check the level of the differential lubricant when finished.

Differential Carrier

REMOVAL & INSTALLATION

Front

1. Raise and support the vehicle safely. Remove the wheel and tire assemblies.

2. Remove the engine undercover. Drain the differential oil.

3. Matchmark and remove the front driveshaft.

4. Remove both axle shafts from the differential.

5. Remove the differential to housing mounting nuts and remove the differential.

6. Clean and inspect the sealing surfaces of the differential and housing.

7. Install the differential in the housing and torque the nuts to 17-20 ft. lbs.

8. The remainder of the installation is the reverse of the removal procedure.

9. Fill the differential to the proper level with SAE 80W-90 oil when finished.

Rear

1. Raise and support the vehicle safely. Remove the tire and wheel assemblies.

2. Drain the differential fluid. Install the plug after all of the fluid has drained.

3. Remove the axle shafts.

4. Matchmark and remove the driveshaft.

5. Remove the carrier to differential housing bolts and remove the carrier assembly from the housing.

To install:

6. Clean the carrier and axle housing mating surfaces.

7. If the differential originally used a gasket between the carrier and the differential housing, replace the gasket. If the unit had no gasket, apply a thin film of oil-resistant silicone sealer to the mating surfaces of both the carrier and the housing and allow the sealer to set according to the manufacturer's instructions.

8. Place the carrier assembly into the housing and install the carrier to housing bolts. Torque the bolts to 12-17 ft. lbs.

9. Install the axle shafts. Align the matchmarks and install the driveshaft.

10. Install the brake drums and wheel assemblies.

11. Fill the differential with the proper amount of SAE 80W-90 fluid.

Axle Housing

REMOVAL & INSTALLATION

Front

1. Raise and safely support the vehicle. Remove the tire and wheel assemblies.

2. Remove the engine under cover. Drain the differential oil.

3. Matchmark and remove the front driveshaft.

4. Matchmark and disconnect the right side axle shaft from the differential.

5. Support the axle housing.

6. Remove the sub-frame mounting bolts and allow the sub-frame to hang down.

7. Remove the axle housing mounting bolts and remove the axle housing from the vehicle.

8. Installation is the reverse of the removal procedure.

9. Observe the following torques during installation:

Sub-frame bolts—59-75 ft. lbs.

Axle housing mounting bolts—41-59 ft. lbs.

Driveshaft bolts—36-43 ft. lbs.

Rear

1. Raise and support the vehicle safely. Remove the tire and wheel assemblies.

2. Disconnect the brake fluid line at the junction.

3. Disconnect the shock absorbers from the lower mounts.

4. Matchmark and remove the driveshaft.

5. Remove the lower spring plate nuts and washers.

6. Remove the U-bolts from the spring plates.

7. Remove the axle housing from the vehicle.

8. Installation is the reverse of the removal procedure.

9. Torque the spring plate nuts to 88-100 ft. lbs. on 4WD vehicles and to 47-58 ft. lbs. on 2WD vehicles.

10. Torque the lower shock absorber bolts to 47-58 ft. lbs. for all models.

11. Bleed the brake system when finished.

STEERING

Steering Wheel

REMOVAL & INSTALLATION

1. Disconnect the battery ground.

2. Pull the steering wheel pad straight up to remove it, then remove the horn button and contact.

3. Remove the horn contact spring.

4. Matchmark the steering wheel and shaft.

5. Remove the wheel attaching nut and remove the wheel with a steering wheel puller.

6. Installation is the reverse of removal. Align the marks and tighten the nut to 35 ft. lbs.

Manual Steering Gear

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.

2. Remove the pinch bolt securing the wormshaft to the steering shaft coupling.

3. Remove the cotter pin and nut securing the pitman arm to the center link and separate the pitman arm from the center link.

4. Remove the steering gear mounting bolts and remove the steering gear from the frame.

5. If removing pitman arm from the sector shaft, matchmark their positions in relation to each other.

6. Installation is the reverse of the removal procedure. Observe the following torques during installation:

Steering gear-to-frame—40 ft. lbs.

Wormshaft-to-steering shaft yoke—28 ft. lbs.

Pitman arm-to-sector shaft—139 ft. lbs.

Pitman arm-to-center link—30 ft. lbs.

1. Nut and cotter pin
2. Outer tie rod end
3. Tie rod end nuts
4. Inner tie rod end
5. Center link
6. Idler arm
7. Bushing
8. Bolt, washers and nut
9. Idler arm bracket
10. Pressure pipe
11. Return pipe
12. Bolt
13. Bolt and washer
14. Bolt, washers and nut
15. Steering gear and pitman arm

Steering gear and linkage—manual steering

1. Cotter pin
2. Nut

4. Fixing bolt
5. Pressure pipe
6. Return hose
7. Steering bracket mounting bolts
8. Steering gear and linkage assembly
9. Mounting bracket bolts
10. Mounting bracket and rubbers
11. Steering gear and linkage
12. Steering brackets

Power steering rack and linkage—MPV

Power Steering Gear

REMOVAL & INSTALLATION

B2000, B2200 and B2600

1. Raise and support the vehicle safely.
2. Remove the pinch bolt securing the wormshaft to the steering shaft coupling.
3. Remove the cotter pin and nut securing the pitman arm to the center link and separate the pitman arm from the center link.
4. Disconnect the fluid lines from the gear and allow the fluid to drain.
5. Remove the steering gear mounting bolts and remove the steering gear from the frame.
6. If removing pitman arm from the sector shaft, matchmark their positions in relation to each other.
7. Installation is the reverse of the removal procedure. Observe the following torques during installation:
Steering gear-to-frame—40 ft. lbs.
Wormshaft-to-steering shaft yoke—28 ft. lbs.
Pitman arm-to-sector shaft—139 ft. lbs.
Pitman arm-to-center link—30 ft. lbs.
8. Bleed the steering system.

MPV

1. Raise and safely support the vehicle.
2. Remove the tire and wheel assembly.
3. Place a drain pan under the steering gear hose connections.
4. Loosen the tie rod end ball stud nut and separate the tie rod end from the knuckle arm with a separator tool. Disconnect the ends.
5. Remove the steering shaft-to-pinion shaft coupling bolt.
6. Matchmark the pressure line connection and disconnect it.

7. Disconnect the return line.
8. On vehicles with automatic transmission, remove the change counter assembly from the protector plate mounting bolt.
9. Support the steering gear assembly with a floor jack under the lower bracket.
10. Remove the steering gear-to-frame bracket mounting bolts.
11. Lower the steering gear and linkage assembly from the vehicle.
12. Remove the steering gear-to-lower bracket clamp bolts, remove the clamps and rubber isolators.

To install:

13. Install the steering gear-to-lower bracket clamp bolts, clamps and rubber isolators. When tightening the bolts, tighten them in this order:
driver's side front
passenger's side front
driver's side rear
passenger's side rear

Torque the bolts to 69 ft. lbs.

14. Raise the steering gear and linkage assembly into position.
15. Install the steering gear-to-frame bracket mounting bolts. Torque the bolts to 69 ft. lbs.
16. Remove the floor jack.
17. On vehicles with automatic transmission, install the change counter assembly from the protector plate mounting bolt.
18. Connect the return line.
19. Connect the pressure line and torque it to 35 ft. lbs.
20. Install the steering shaft-to-pinion shaft coupling bolt. Torque the bolt to 20 ft. lbs.
21. Connect the ends. Tighten the ball stud nuts to 58 ft. lbs. Always use a new cotter pin on the ball stud nut. Always advance the nut to align the cotter pin hole. Never back it off.
22. Install the wheels.
23. Fill the steering system and bleed it of air.

Removing the change counter assembly—MPV

Power Steering Pump

REMOVAL & INSTALLATION

Except MPV

1. Disconnect the negative battery cable.
2. Remove the power steering pump pulley nut.
3. Loosen the drive belt tensioner pulley and remove the belt.
4. Remove the pulley from the pump.
5. Disconnect and plug the fluid lines at the pump.
6. Remove the pump bracket bolts and remove the pump from the vehicle.
7. Installation is the reverse of the removal procedure. Adjust the drive belt tension. Fill and bleed the power steering system when finished.

MPV

1. Disconnect the negative battery cable. Loosen the idler pulley locknut.
2. Loosen the pump adjusting bolt.
3. Remove the drive belt.
4. Remove the pump pulley nut. Using a puller, remove the pulley.
5. Disconnect the pressure switch wiring connector.
6. Place a drain pan under the pump.
7. Matchmark the pressure line connection and disconnect it.
8. Remove the pressure line bracket bolt.
9. Disconnect the return line.
10. Remove the pump-to-bracket bolts and lift out the pump.
11. Installation is the reverse of removal. Observe the following torques:
Mounting bolts—34 ft. lbs.
Pressure line connection—35 ft. lbs.
Pressure line bracket bolt—17 ft. lbs.
Pulley bolt—43 ft. lbs.
Adjusting bolt—35 ft. lbs.
Idler pulley locknut—38 ft. lbs.

SYSTEM BLEEDING

1. Check and fill the power steering fluid level.
2. Start and run the engine at idle. Turn the steering wheel lock-to-lock, several times. Turn the engine off, check and fill the fluid.
3. Start and run the engine at idle and turn the wheel lock-to-lock several times again.
4. Place the wheels in the straight ahead position and shut off the engine.
5. Allow the fluid to settle in the system for a few minutes and check the fluid level again.

1. Oil pump belt
2. Locknut
3. Oil pump pulley
4. Pressure switch coupler
5. Pressure pipe
6. Return hose
7. Oil pump assembly

Power steering pump mounting

6. Check for the presence of foaming in the fluid. Repeat the procedure until the fluid is clear and remains at the same level, with the engine off.

Tie Rod Ends

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Remove the tire and wheel assembly. Loosen the tie rod jam nuts.

2. Remove and discard the cotter pin from the ball socket end and remove the nut.

3. Disconnect the ball socket stud from the center link. Remove the stud from the kingpin steering arm.

4. Unscrew the tie rod end from the threaded sleeve, counting the number of threads until it is off. The threads may be left or right hand threads. Tighten the jam nuts to 58 ft. lbs.

5. To install, lightly coat the threads with grease and turn the new end in as many turns as were required to remove it. This will give the approximate correct toe-in.

6. Install the ball socket studs into center link and kingpin steering arm. Tighten the nuts to 30 ft. lbs. Install a new cotter pin. If the cotter pin hole does not line up, tighten the nut to install the cotter pin. Never loosen the nut.

7. Tighten the tie rod clamps or jam nuts. Check and adjust the toe in.

BRAKES

For all brake system repair and service procedures not covered below, please refer to "Brakes" in the Unit Repair section.

Master Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Disconnect and plug the brake lines at the master cylinder.

2. Disconnect the fluid level sensor coupling.

3. Remove the master cylinder mounting bolts and remove the master cylinder from the power booster.

4. Installation is the reverse of the removal procedure. Torque the mounting nuts to 15 ft. lbs.

Proportioning Bypass Valve

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Disconnect and cap the brake lines at the valve.

3. Remove the attaching bolts. Remove the valve.

4. Installation is the reverse of removal.

5. Bleed the system.

Load Sensing Proportioning Valve

REMOVAL & INSTALLATION

MPV

1. Raise and support the vehicle safely.

2. Remove the nut attaching the bracket to the axle housing.

3. Disconnect the brake lines at the valve.

4. Remove the valve attaching bolts. Remove the valve.

5. Installation is the reverse of removal. Install the valve first, then the axle bracket.

6. When installing the axle bracket, position it so that the length of the spring, measured between the 2 collars, is 150.5mm, with no extra load in the vehicle.

7. Bleed the brake system.

Load Sensing G-Valve

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.

2. Disconnect and cap the brake lines.

3. Remove the valve mounting bolts. Remove the valve.

4. Install the new valve, tighten the bolts, connect the brake lines and bleed the system.

5. Adjust the inclination angle of the valve:

a. Place the vehicle on level ground.

b. Make sure that there is no cargo in the vehicle.

c. Fill the tires to the recommended inflation pressure.

d. Attach angle gauge 49 U043 003, or equivalent, to the valve. The correct angle should be $7^\circ \pm 1\frac{1}{2}^\circ$ for the B-series; $8\frac{1}{2}^\circ \pm 1^\circ$ for the MPV. If not:

e. Loosen the mounting bolts and move the valve until the angle is correct.

f. Tighten the bolts.

Power Brake Booster

REMOVAL & INSTALLATION

Except MPV

1. Disconnect the negative battery cable. Disconnect and plug the master cylinder fluid lines and remove the

Checking the load sensing G-valve

master cylinder from the booster.

2. Disconnect the booster pushrod at the brake pedal.

3. Remove the power brake booster mounting nuts and remove the booster from the firewall.

4. Installation is the reverse of the removal procedure.

5. Check the clearance between the master cylinder piston and the power booster pushrod. Clearance should be 0.004–0.020 in. If not, adjust the clearance at the pushrod.

6. Tighten the power brake booster mounting nuts to 17 ft. lbs.

7. Bleed the brake system when finished.

MPV

1. Disconnect the negative battery cable. Remove the wiper arms.

2. Remove the drive link nuts from the top of the cowl.

3. Working under the hood, disconnect the battery ground cable.

4. Remove the wiper motor and linkage mounting bolts and lift out the assembly.

5. Remove the master cylinder.

6. Disconnect the pushrod at the pedal.

7. Disconnect the vacuum line at the booster.

9. Unbolt and remove the power booster from the firewall.

To install:

10. Check the clearance between the master cylinder piston and the power booster pushrod. Clearance should be zero, but the piston should not depress the pushrod. Adjust the clearance at the pushrod.

11. Position a new mounting gasket, coated with sealant, on the firewall.

12. Position the vacuum unit on the firewall and install the nuts. Torque the mounting nuts to 19 ft. lbs.

13. Connect the pushrod at the pedal.

14. Connect the vacuum line.

15. Install the master cylinder.

16. Install the wiper motor and link-

age. When installing the wiper arms, make sure that the at-rest position gives a gap of 30mm between the blade tips and the lower windshield moulding.

17. Bleed the brakes.

Brake Caliper

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Remove the wheel and tire assembly.

2. Disconnect and plug the brake fluid line at the caliper.

3. Remove the bottom lock pin bolt from the caliper and pivot the caliper upwards.

4. Remove the brake pads and shims from the caliper.

5. Remove the upper caliper pivot bolt and remove the caliper from the mount.

6. Installation is the reverse of the removal procedure. Bleed the brake caliper when finished.

Disc Brake Pads

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Remove the wheel and tire assembly.

2. Remove the bottom lock pin bolt from the caliper and pivot the caliper upwards.

3. Remove the brake pads and shims.

4. Push the caliper piston inwards until it is fully seated.

5. Install the brake pads and shims in the caliper.

6. Install the caliper to the mount and install the lock pin bolt. Torque the bolt to 23–30 ft. lbs.

7. Install the wheel assembly and lower the vehicle.

8. Pump the brake pedal until pressure is felt before moving the vehicle.

Disc brake assembly—typical

Brake Rotor

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Remove the wheel and tire assembly.
2. Without disconnecting the brake fluid line, remove the brake caliper from the mount and support the caliper out of the way. Remove the caliper mount from the steering knuckle.
3. On 2WD vehicles, remove the dust cap, cotter pin, nut and washer from the hub. On 4WD vehicles, remove the locking hub, spacer, bearing plate and lock nut.
4. Remove the brake rotor assembly from the vehicle.
5. If only the rotor is being replaced, remove the hub to rotor mounting bolts and install the hub on the new brake rotor.
6. Installation is the reverse of the removal procedure.
7. Adjust the wheel bearings when finished.

Brake Drums

REMOVAL & INSTALLATION

1. Loosen the lug nuts on the rear wheels.

2. Raise and safely support the vehicle.
3. Remove the lug nuts and the rear tire and wheel.
4. Be sure that the parking brake is fully released.
5. Remove the bolts or screws which secure the drum to the rear axle shaft flange or center locknut.

NOTE: If the drum will not come off easily, screw the drum securing bolts into the 2 tapped holes in the drum. Tighten the bolts evenly in order to force the drum away from the flange.

6. Remove the brake drum.
7. Installation is the reverse of the removal procedure.
8. Adjust the shoes after installation is completed.

Brake Shoes

REMOVAL & INSTALLATION

Except MPV

1. Raise and safely support the vehicle. Remove the tire and wheel assembly. Remove the brake drum. Make sure that the parking brake is fully released.
2. Remove the return springs from the upper side of the shoe using a

brake spring removal tool.

3. Remove the return springs from the lower side of the shoes.
4. Remove the shoe retaining spring by compressing the retaining spring while turning the pin 90 degrees.
5. Withdraw the primary shoes and the parking brake link.
6. Disengage the parking brake lever from the secondary shoes by unfastening its retaining clip.
7. Remove the secondary shoe.
8. Inspect the linings and replace them if they are badly burned or worn.
9. Replace the linings if they are saturated with oil or grease.

To install:

10. Lubricate the threads of the adjusting screw, the sliding surfaces of the shoes, and the backing plate flanges with a small quantity of grease.
11. Install the eye of the parking brake cable through the parking brake lever which has previously been installed on the secondary shoe and secured with its retaining clip.
12. Fit the link between the shoes.
13. Engage the shoes with the slots in the anchor (adjusting screw) and the wheel cylinder.
14. Fasten the shoes to the backing plate with the retaining springs and pins.
15. Install the shoe return springs with the tool used during removal.
16. Install the drums and adjust the shoes.
17. Install the tire and wheel assembly.

MPV

1. Raise and safely support the vehicle.
 2. Remove the tire and wheel assembly. Remove the brake drum.
 3. Disconnect the parking brake cable. Remove the hold-down spring assemblies.
 4. Remove the self-adjusting lever. Remove the lever link.
 5. Remove the pull-off spring.
 6. Remove the lower shoe-to-shoe spring. Remove the 2 upper return springs.
 7. Remove the star wheel adjuster. Remove the brake shoes and strut.
 8. Remove the parking brake cable lever.
 9. Inspect the shoes for cracks, heat checking or contamination by oil or grease.
 10. Lubricate the threads of the starwheel with lithium based or silicone based grease. Apply a small dab of lithium or silicone based grease to the pads on which the brake shoes ride.
- To install:**
11. Position the brake shoes on the

1. Brake drum
2. Parking brake cable
3. Hold spring and sleeve
4. Adjust lever
5. Link
6. Pull-off spring
7. Shoe spring
8. Return spring
9. Return spring
10. Adjuster
11. Primary brake shoe
12. Secondary brake shoe
13. Strut
14. Wheel cylinder assembly

Drum brake assembly—typical

backing plate. Connect the parking brake.

12. Install the hold-down spring assemblies. Install the strut and star-wheel adjuster.

13. Install the 2 upper return springs. Install the lower spring.

14. Install the pull-off spring. Install the lever link and self-adjusting lever.

15. Install the brake drum.

16. Working through the hole in the backing plate, turn the star-wheel screw with a brake adjusting spoon until the wheel is locked, that is, it can't be turned by hand.

17. Back off the adjuster 8-10 clicks, or until the wheel is free to rotate.

NOTE: The adjustment should be the same on both wheels.

18. Adjust the parking brake.

19. Operate the brake pedal a few times. If the brakes feel at all spongy, bleed the system.

Wheel Cylinder

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Remove the tire and wheel assembly.

2. Remove the brake drum. Inspect the brake components for signs of damage from leaking brake fluid. Replace if necessary.

3. Disconnect and plug the brake line at the wheel cylinder.

4. Remove the 2 wheel cylinder mounting bolts and remove the wheel cylinder from the backing plate by spreading the brake shoes apart. If necessary, remove the brake shoes from the vehicle.

5. Spread the brake shoes apart and install the new wheel cylinder on the backing plate.

6. Torque the mounting bolts to 7-9 ft. lbs.

7. Install the brake line in the wheel cylinder and torque the flare nut to 10-13 ft. lbs.

8. Install the brake drum and wheel assembly. Bleed the wheel cylinder.

9. Check the system operation before moving the vehicle.

Parking Brake Cable

REMOVAL & INSTALLATION

Front

1. Raise and support the vehicle safely.

2. Remove the front cable adjusting nut.

3. Separate the front cable from the equalizer and remove the jam nut.

4. Remove the return spring and boot from the cable housing.

5. Pull the lower cable housing forward and out of the slotted frame bracket. Slip the cable shaft sideways through the slot until the cable and housing are free of the bracket.

6. Disengage the upper cable connector from the brake lever by removing the clevis pin and retainer.

7. Remove the upper cable housing retaining clip and pull the upper cable and housing from the slotted bracket on the firewall.

8. Push the upper cable, cable housing and dust shield grommet through the firewall opening and into the engine compartment.

9. Remove the cable and housing.

10. Installation is the reverse of the removal procedure. Adjust the parking brake cable when finished.

Rear

1. Raise and support the vehicle safely.

2. Remove the pin and disconnect the equalizer from the clevis.

3. Disconnect the right side cable from the left cable.

4. Remove the rear wheels, brake drums and brake shoes.

5. Disengage the cables from the brake shoe levers.

6. Remove the cable housing retainer from the backing plate.

7. Pull the return spring to release the retainer plate from the end of the housing.

8. Loosen the cable housing to frame bracket locknut and remove the forward end of the cable housing from the frame bracket.

9. Remove the cable housing retaining clip bolts.

10. Disengage the cable housing to frame tension springs and pull the cable out of the backing plate.

11. Installation is the reverse of the removal procedure.

12. Adjust the cable when finished.

ADJUSTMENT

1. Adjust the rear brake shoes before attempting to adjust the parking brake.

2. Use the adjusting nut to adjust the length of the front cable so that the rear brakes are locked when the parking brake lever is pulled out 11-13 notches.

3. After adjustment, apply the parking brake several times. Release the parking brake and make sure that the rear wheels rotate without dragging. If they drag, repeat the adjustment.

NOTE: If the parking brake cable is replaced, prestretch it by applying the parking brake hard 3 or 4 times before attempting adjustment.

FRONT SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

Except MPV

1. Raise and support the vehicle safely. Remove the tire and wheel assembly.

2. Remove the upper shock absorber mounting nut, washers and bushings.

3. Compress the shock absorber to a level under the upper control arm.

4. Remove the lower shock absorber mounting bolt and nut.

5. Remove the shock absorber from the vehicle.

6. Installation is the reverse of the removal procedure.

7. Torque the lower shock absorber bolt and nut to 40-59 ft. lbs.

8. Torque the upper shock absorber nut to 17-25 ft. lbs. or, until there is a of 7mm of thread protruding from the shock absorber threads.

MacPherson Strut

REMOVAL & INSTALLATION

MPV

1. Raise and safely support the vehicle.

2. Remove the tire and wheel assembly.

3. Unclip the brake line from the strut.

4. Remove the lower strut bolts.

5. Remove the rubber cap from the upper end of the strut.

6. Remove the 4 upper end mounting nuts.

7. Remove the strut from the vehicle.

8. Installation is the reverse of removal.

9. The mounting block is installed at the upper end with the white mark on the block facing the front-inside direction.

10. Torque the lower mounting bolts to 85 ft. lbs.; the upper nuts to 25 ft. lbs.

Torsion Bar

REMOVAL & INSTALLATION

4wd Vehicles

1. Raise and support the vehicle safely. Remove the tire and wheel assembly.

2. Support the torsion bar. Matchmark the torsion bar anchor bolt to the torsion bar and remove the torsion bar anchor bolt.

3. Matchmark the torsion bar to the anchor plate and remove the anchor plate from the body. Remove the torsion bar to torque plate bolts. Remove the torsion bar from the plate.

4. Support the lower control arm and remove the lower ball joint cotter pin and nut. Disconnect the shock absorber from the lower control arm.

5. Separate the lower ball joint from the steering knuckle.

6. Remove the front torsion bar to lower control arm bolt. Remove the torsion bar.

7. Installation is the reverse of the removal procedure. Align the matchmarks made during the removal.

8. Torque the ball joint nut to 87–115 ft. lbs. and the torsion bar anchor plate to 55–69 ft. lbs. Torque the shock absorber bolt to 40–59 ft. lbs.

9. Check and adjust the vehicle ride height if necessary, when finished.

bar.

8. Remove the torque plate.

9. Remove the lower control arm to frame bolt. Separate the lower arm from the frame bracket with bushing puller/installer 49 0727 575 or its equivalent.

10. Disconnect and remove the tension rod from the lower control arm.

NOTE: Do not change the position of the double nut at the rear of the tension rod bushing. It will affect the vehicles caster alignment.

11. Remove the stabilizer bar bolt, bushing, retainer and nut. Remove the stabilizer bar.

1. Shock absorber
2. Stabilizer
3. Torsion bar
4. Anchor arm
5. Anchor bolt
6. Tension rod
7. Upper arm
8. Lower arm

Front suspension assembly—B2000 and B2200

Torsion Bar and Lower Control Arm

REMOVAL & INSTALLATION

2wd Vehicles Except MPV

1. Raise and support the vehicle safely, with the front suspension hanging freely.

2. Remove the tire and wheel assembly.

3. Remove the cotter pin and nut from the lower ball joint.

4. Remove the lower shock absorber mounting bolt.

5. Matchmark the anchor arm bolt and anchor swivel. Remove the bolt and swivel.

NOTE: The matchmarks made determine and are critical to, the vehicles ride height. Failure to do so, will result in having to set the vehicles ride height when finished.

6. Matchmark the torsion bar and anchor arm. Matchmark the torsion bar and torque plate.

7. Remove the anchor arm and torsion bar from the torque plate. Separate the anchor arm from the torsion

1. Shock absorber
2. Stabilizer
3. Torsion bar
4. Anchor arm
5. Anchor bolt
6. Upper arm
7. Lower arm

Front suspension assembly—B2600

12. Separate the lower ball joint from the knuckle. Remove the lower control arm.

13. Inspect all parts for wear or damage. Replace any suspect parts. Using a spring scale and adapter 49 0180 510B or equivalent, check the ball joint preload. Pull scale reading should be 39.6 lbs. or less. Measure the preload after first shaking the ball joint stud to make sure it is free.

14. Install the lower arm on the frame bracket and hand tighten the nut.

15. Install the lower ball joint on the knuckle and torque the nut to 115 ft. lbs. Install the cotter pin.

16. Tighten the lower arm to frame nut to 115 ft. lbs.

17. Position the torque plate and tighten the bolt to 68 ft. lbs.

18. Coat the splines on the torsion bar with grease. Check the ends of the torsion bar. The bars are marked L for left and R for right. Align the matchmarks and install the torsion bar in the torque plate.

19. Coat the splines on the torsion bar with grease. Align the matchmarks and install the anchor arm on the torsion bar.

20. Install the anchor bolt and swivel and tighten the bolt until the matchmarks are mated.

21. Install the tension rod. Torque the bushing end nut to 90 ft. lbs.; the lower arm end bolts to 85 ft. lbs.

22. Install the stabilizer bar. Torque the bolt to 19 ft. lbs.

23. Install the shock absorber bolt. Torque the bolt to 55–59 ft. lbs.

24. Install the wheel assembly and lower the vehicle to the ground.

25. Retorque the lower arm to frame bracket nut.

26. Check the front and rear tire pressures. Set the pressures to what are specified on the vehicle rating plate, except for P-metric radials. Set them at the maximum pressure shown on the side wall.

27. Measure the distance from the center of the wheel hub to the lip of the fender. This is the ride height. Proper ride height is obtained when the difference between the left and the right side is less than 10mm. Adjust the ride height by turning the anchor bolt.

NOTE: If the torsion bar anchor bolt was not matchmarked, the matchmarks were lost, or new, unmarked torsion bar is being installed, follow this procedure to obtain the correct ride height.

28. Install the anchor arm on the torsion bar so that there is 125mm between the lowest point on the arm and the crossmember directly above it.

29. Tighten the anchor bolt until the anchor arm contacts the swivel. Then, tighten the bolt an additional 45mm travel.

Upper Ball joints

INSPECTION

1. Inspect the dust seals. If cracked or brittle, replace them. *

2. Check end play of both the upper and lower ball joints. If either exceeds 0.0039 in., it is defective and must be replaced.

REMOVAL & INSTALLATION

2wd Vehicles Except MPV

1. Raise and support the vehicle safely.

2. Remove the tire and wheel assemblies. Support the lower control arm.

3. Remove the cotter pin and nut from the upper ball joint and separate the ball joint from the upper control arm.

4. Remove the bushings and dust seals from the ends of the upper control arm shaft.

5. Remove the nuts and bolts that retain the upper control arm shaft to the support bracket. Note the number and location of the shims under the nuts.

NOTE: These shims must be installed in their exact locations for proper wheel alignment.

6. Check all parts for wear or damage. Replace any suspect parts.

7. Check the ball joint preload with a pull scale and adapter 49 0180 510B or equivalent. Move the ball joint stud a few times to make sure that it is free, then take the reading. The pull scale reading should be 40 lbs. or less. Replace if necessary, using a press.

8. Installation is the reverse of the removal procedure.

9. Torque the upper control arm shaft mounting bolts to 60–68 ft. lbs. and the ball joint nut to 30–37 ft. lbs.

4wd Vehicles

1. Raise and support the vehicle safely.

2. Remove the tire and wheel assembly. Support the lower control arm.

3. Remove the cotter pin and nut from the upper ball joint and separate the ball joint from the upper control arm.

4. Remove the bushings and dust seals from the ends of the upper control arm shaft.

5. Remove the nuts and bolts that retain the upper control arm shaft to the support bracket. Note the number and location of the shims under the nuts.

NOTE: These shims must be installed in their exact locations for proper wheel alignment.

6. Check all parts for wear or damage. Replace any suspect parts.

7. Check the ball joint preload with a pull scale and adapter 49 0180 510B or its equivalent. Move the ball joint stud a few times to make sure that it is free, then take the reading. The pull scale reading should be 40 lbs. or less.

8. Remove the ball joint mounting bolts. Using a press, remove the upper ball joint from the control arm.

9. Installation is the reverse of the removal procedure.

10. Torque the upper control arm shaft mounting bolts to 60–68 ft. lbs. and the ball joint nut to 30–37 ft. lbs. Check the front end alignment if necessary.

Lower Ball Joints

INSPECTION

1. Inspect the dust seals. If cracked or brittle, replace them.

2. Check end play of both the upper and lower ball joints. If either exceeds 0.0039 in., it is defective.

REMOVAL & INSTALLATION

2wd Vehicles Except MPV

1. Raise and support the vehicle safely, with the front suspension hanging freely.

2. Remove the tire and wheel assembly.

3. Remove the cotter pin and nut from the lower ball joint.

4. Remove the lower shock absorber mounting bolt.

5. Matchmark the anchor arm bolt and anchor swivel. Remove the bolt and swivel.

NOTE: The matchmarks made determine and are critical to, the vehicles ride height. Failure to do so, will result in having to set the vehicles ride height when finished.

6. Matchmark the torsion bar and anchor arm. Matchmark the torsion bar and torque plate.

7. Remove the anchor arm and torsion bar from the torque plate. Separate the anchor arm from the torsion bar.

8. Remove the torque plate.

9. Remove the lower control arm to frame bolt. Separate the lower arm from the frame bracket with bushing puller/installer 49 0727 575 or its equivalent.

10. Disconnect and remove the tension rod from the lower control arm.

NOTE: Do not change the position of the double nut at the rear of the tension rod bushing. It will affect the vehicles caster alignment.

11. Remove the stabilizer bar bolt, bushing, retainer and nut. Remove the stabilizer bar.

12. Separate the lower ball joint from the knuckle. Remove the lower control arm.

13. Inspect all parts for wear or damage. Replace any suspect parts. Using a spring scale and adapter 49 0180 510B or equivalent, check the ball joint preload. Pull scale reading should be 39.6 lbs. or less. Measure the preload after first shaking the ball joint stud to make sure it is free. Replace if necessary, using a press.

To install:

14. Install the lower arm on the frame bracket and hand tighten the nut.

15. Install the lower ball joint on the knuckle and torque the nut to 115 ft. lbs. Install the cotter pin.

16. Tighten the lower arm to frame nut to 115 ft. lbs.

17. Position the torque plate and tighten the bolt to 68 ft. lbs.

18. Coat the splines on the torsion bar with grease. Check the ends of the torsion bar. The bars are marked L for left and R for right. Align the matchmarks and install the torsion bar in the torque plate.

19. Coat the splines on the torsion bar with grease. Align the matchmarks and install the anchor arm on the torsion bar.

20. Install the anchor bolt and swivel and tighten the bolt until the matchmarks are mated.

21. Install the tension rod. Torque the bushing end nut to 90 ft. lbs.; the lower arm end bolts to 85 ft. lbs.

22. Install the stabilizer bar. Torque the bolt to 19 ft. lbs.

23. Install the shock absorber bolt. Torque the bolt to 55–59 ft. lbs.

24. Install the wheel assembly and lower the vehicle to the ground.

25. Retorque the lower arm to frame bracket nut.

26. Check the front and rear tire pressures. Set the pressures to what are specified on the vehicle rating plate, except for P-metric radials. Set them at the maximum pressure shown on the side wall.

27. Measure the distance from the

center of the wheel hub to the lip of the fender. This is the ride height. Proper ride height is obtained when the difference between the left and the right side is less than 10mm. Adjust the ride height by turning the anchor bolt.

NOTE: If the torsion bar anchor bolt was not matchmarked, the matchmarks were lost, or new, unmarked torsion bar is being installed, follow this procedure to obtain the correct ride height.

28. Install the anchor arm on the torsion bar so that there is 125mm between the lowest point on the arm and the crossmember directly above it.

29. Tighten the anchor bolt until the anchor arm contacts the swivel. Then, tighten the bolt an additional 45mm travel.

4wd Vehicles

1. Raise and support the vehicle safely. Remove the tire and wheel assembly.

2. Matchmark and remove the torsion bar from the control arm.

3. Disconnect the stabilizer bar from the lower control arm. Note the position of the stabilizer bar bushings.

4. Support the lower control arm and remove the front pivot bolt.

5. Remove the lower control arm from the frame.

6. Remove the lower ball joint to control arm mounting bolts. Using a press, remove the ball joint from the control arm.

To install:

7. Using a press, install the new ball joint in the control arm. The remainder of the installation is the reverse of the removal procedure.

8. Observe the following torques during installation:

Lower control arm front pivot bolt 87–115 ft. lbs.

Lower control arm rear bolt 115–145 ft. lbs.

Shock absorber lower bolt 40–59 ft. lbs.

Torsion bar torque plate bolts 55–69 ft. lbs.

9. Check and adjust the vehicle ride height, if necessary. Correct ride height, measured from the center line of the wheel to the top of the front fender well, should be 17.01 in. for short beds and 16.85 in. for long beds.

Upper Control Arms

REMOVAL & INSTALLATION

Except MPV

1. Raise and support the vehicle safely.

2. Remove the tire and wheel assemblies. Support the lower control arm.

3. Remove the cotter pin and nut from the upper ball joint and separate the ball joint from the upper control arm.

4. Remove the bushings and dust seals from the ends of the upper control arm shaft.

5. Remove the nuts and bolts that retain the upper control arm shaft to the support bracket. Note the number and location of the shims under the nuts.

NOTE: These shims must be installed in their exact locations for proper wheel alignment.

6. Check all parts for wear or damage. Replace any suspect parts.

7. Check the ball joint preload with a pull scale and adapter 49 0180 510B or equivalent. Move the ball joint stud a few times to make sure that it is free, then take the reading. The pull scale reading should be 40 lbs. or less.

8. Installation is the reverse of the removal procedure.

9. Torque the upper control arm shaft mounting bolts to 60–68 ft. lbs. and the ball joint nut to 30–37 ft. lbs.

Lower Control Arm

REMOVAL & INSTALLATION

2wd Vehicles Except MPV

1. Raise and support the vehicle safely, with the front suspension hanging freely.

2. Remove the tire and wheel assembly.

3. Remove the cotter pin and nut from the lower ball joint.

4. Remove the lower shock absorber mounting bolt.

5. Matchmark the anchor arm bolt and anchor swivel. Remove the bolt and swivel.

NOTE: The matchmarks made determine and are critical to, the vehicles ride height. Failure to do so, will result in having to set the vehicles ride height when finished.

6. Matchmark the torsion bar and anchor arm. Matchmark the torsion bar and torque plate.

7. Remove the anchor arm and torsion bar from the torque plate. Separate the anchor arm from the torsion bar.

8. Remove the torque plate.

9. Remove the lower control arm to frame bolt. Separate the lower arm from the frame bracket with bushing puller/installer 49 0727 575 or its

equivalent.

10. Disconnect and remove the tension rod from the lower control arm.

NOTE: Do not change the position of the double nut at the rear of the tension rod bushing. It will affect the vehicles caster alignment.

11. Remove the stabilizer bar bolt, bushing, retainer and nut. Remove the stabilizer bar.

12. Separate the lower ball joint from the knuckle. Remove the lower control arm.

13. Inspect all parts for wear or damage. Replace any suspect parts. Using a spring scale and adapter 49 0180 510B or equivalent, check the ball joint preload. Pull scale reading should be 39.6 lbs. or less. Measure the preload after first shaking the ball joint stud to make sure it is free. Replace if necessary.

To install:

14. Install the lower arm on the frame bracket and hand tighten the nut.

15. Install the lower ball joint on the knuckle and torque the nut to 115 ft. lbs. Install the cotter pin.

16. Tighten the lower arm to frame nut to 115 ft. lbs.

17. Position the torque plate and tighten the bolt to 68 ft. lbs.

18. Coat the splines on the torsion bar with grease. Check the ends of the torsion bar. The bars are marked **L** for left and **R** for right. Align the matchmarks and install the torsion bar in the torque plate.

19. Coat the splines on the torsion bar with grease. Align the matchmarks and install the anchor arm on the torsion bar.

20. Install the anchor bolt and swivel and tighten the bolt until the matchmarks are mated.

21. Install the tension rod. Torque the bushing end nut to 90 ft. lbs.; the lower arm end bolts to 85 ft. lbs.

22. Install the stabilizer bar. Torque the bolt to 19 ft. lbs.

23. Install the shock absorber bolt. Torque the bolt to 55–59 ft. lbs.

24. Install the wheel assembly and lower the vehicle to the ground.

25. Retorque the lower arm to frame bracket nut.

26. Check the front and rear tire pressures. Set the pressures to what are specified on the vehicle rating plate, except for P-metric radials. Set them at the maximum pressure shown on the side wall.

27. Measure the distance from the center of the wheel hub to the lip of the fender. This is the ride height. Proper ride height is obtained when the difference between the left and the right

side is less than 10mm. Adjust the ride height by turning the anchor bolt.

NOTE: If the torsion bar anchor bolt was not matchmarked, the matchmarks were lost, or new, unmarked torsion bar is being installed, follow this procedure to obtain the correct ride height.

28. Install the anchor arm on the torsion bar so that there is 125mm between the lowest point on the arm and the crossmember directly above it.

29. Tighten the anchor bolt until the anchor arm contacts the swivel. Then, tighten the bolt an additional 45mm travel.

4wd Vehicles

1. Raise and support the vehicle safely. Remove the tire and wheel assembly.

2. Matchmark and remove the torsion bar from the control arm.

3. Disconnect the stabilizer bar from the lower control arm. Note the position of the stabilizer bar bushings.

4. Support the lower control arm and remove the front pivot bolt.

5. Remove the lower control arm from the frame.

6. Installation is the reverse of the removal procedure.

7. Observe the following torques during installation:

Lower control arm front pivot bolt 87–115 ft. lbs.

Lower control arm rear bolt 115–145 ft. lbs.

Shock absorber lower bolt 40–59 ft. lbs.

Torsion bar torque plate bolts 55–69 ft. lbs.

8. Check and adjust the vehicle ride height, if necessary. Correct ride height, measured from the center line of the wheel to the top of the front fender well, should be 17.01 in. for short beds and 16.85 in. for long beds.

MPV

1. Raise and safely support the vehicle.

2. Remove the tire and wheel assembly.

3. Remove the caliper and suspend it out of the way. It's not necessary to disconnect the brake line.

4. Remove the compression rod.

5. Disconnect the tie rod end, using a separator.

6. Support the lower arm with a floor jack and disconnect the lower end of the strut.

7. Remove the lower ball joint nut and separate it from the knuckle using a separator.

8. Remove the lower arm-to-frame

bolt and remove the arm.

9. Check all parts for wear or damage and replace if necessary.

NOTE: The ball joint is part of the arm. If either is bad, the entire assembly must be replaced.

To install:

10. Install the lower arm. Torque the arm-to-frame bolt to 108 ft. lbs.

11. Connect the lower ball joint and knuckle. Torque the nut to 116 ft. lbs. Install a new cotter pin. Never back-off the nut to align the cotter pin hole. Always advance it.

12. Connect the lower end of the strut. Torque the bolts to 86 ft. lbs.

13. Connect the tie rod end. Torque the nut to 58 ft. lbs. Never back-off the nut to align the cotter pin hole. Always advance it.

14. Install the compression rod.

15. Install the caliper.

16. Install the wheels.

Stabilizer Bar

REMOVAL & INSTALLATION

Except MPV

1. Raise and safely support the vehicle.

2. Unbolt the stabilizer bar-to-frame clamps.

3. Unbolt the stabilizer bar from the lower control arms. Keep all the bushings, washers and spacers in order.

4. Check all parts for wear or damage and replace anything which looks suspicious.

5. Installation is the reverse of removal. Tighten all fasteners lightly, then torque them to specifications with the wheels on the ground.

6. The correct torque is:

Stabilizer bar-to-control arm nut—34 ft. lbs.

Stabilizer-to-frame clamp bolts—16 ft. lbs.

MPV

1. Raise and safely support the vehicle.

2. Remove the splash shield.

3. Disconnect the end links at the compression rods.

4. Remove the clamp bolts. Lift out the stabilizer bar.

5. Inspect all parts for wear and/or damage. Replace as necessary.

6. Installation is the reverse of removal. The end link bushings have alignment marks on the bar. Torque the clamp bolts to 45 ft. lbs. Tighten the end link bolts until 13mm $\pm$ 1mm of thread is visible above the nut.

Tension Rod

REMOVAL & INSTALLATION

Except MPV

1. Raise and safely support the vehicle. Remove the under engine splash shield.

2. Unbolt the tension rod from the lower arm and frame and remove it.

NOTE: Don't change the position of the double nut at the rear of the tension rod bushing, since it would affect caster.

3. Install the tension rod. Torque the bushing end nut to 90 ft. lbs.; the lower arm end bolts to 85 ft. lbs.

Compression Rod

REMOVAL & INSTALLATION

MPV

1. Raise and safely support the vehicle.

2. Disconnect the stabilizer link at the compression rod.

3. Remove the compression rod-to-lower arm bolts.

4. Remove the compression rod end nut and washer.

5. Unbolt the compression rod fluid-filled bushing and remove the bushing and washers.

6. Check the bushing for signs of leakage. Replace it if leaking or damaged.

7. Installation is the reverse of removal. Observe the following torques:

Fluid-filled bushing bolts—76 ft. lbs.

Compression rod end nut—127 ft. lbs.

Compression rod-to-lower arm—93 ft. lbs.

8. Tighten the stabilizer bar end link bolt until 13mm of thread is visible above the nut.

Front Wheel Bearings

REMOVAL & INSTALLATION

2wd Vehicles

1. Raise and support the vehicle safely.

2. Remove the tire and wheel assembly.

3. Remove the grease cap, cotter pin, hub nut and flat washer.

4. Without disconnecting the brake line from the caliper, remove the caliper and support it out of the way. Place a hand over the outer wheel bearing and remove the hub from the spindle.

5. Remove the spacer, inner seal and inner bearing. Discard the seal.

6. Thoroughly clean the inside of the hub with solvent. Allow to dry completely before proceeding.

7. Inspect the bearings for wear, damage, heat discoloration or other signs of fatigue. If they are at all suspect, replace them.

NOTE: When replacing wheel bearings, replace the bearings and races as a set. Never mix bearings and races.

8. To replace the races, carefully press them out of the hub.

9. Coat the outside of the new races with clean wheel bearing grease and drive them into place until they are seated in the hub. Make certain that they are completely seated.

10. Pack the inside of the hub with clean wheel bearing grease.

11. Pack each bearing with clean grease, making sure that it is thoroughly packed.

12. Install the inner bearing and seal. Drive the seal into place carefully until it is seated to the same depth as when removed.

13. Install the spacer and the hub on the spindle.

14. Install the outer bearing, flat washer and hub nut.

15. Adjust the wheel bearing.

16. Install the nut cap, cotter pin and grease cap. Install the wheel assembly.

ADJUSTMENT

1. Raise and support the vehicle safely.

2. Remove the tire and wheel assembly. Without disconnecting the brake line, remove the disc brake caliper. Support the caliper out of the way.

3. Attach a spring scale to a wheel stud on the hub.

4. Pull the scale horizontally and check the force needed to start the hub turning. The force should be 1.3–2.4 lbs. If the reading is not correct, adjust the bearing.

5. To adjust, remove the grease cap and cotter pin.

6. Tighten or loosen the hub nut until the correct pull rating is obtained.

7. Align the cotter pin holes and insert a new cotter pin. Install the grease cap and wheel assembly.

Compression rod mounting—MPV

REAR SUSPENSION

Shock Absorber

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.

2. Remove the tire and wheel assemblies.

3. Support the rear axle with a suitable jack.

4. Unbolt and remove the shock absorber at each end.

5. On MPV equipped with air ride

suspension, disconnect the air line from the shock absorber.

6. Installation is the reverse of removal. Torque the bolts to 57 ft. lbs.

Coil Springs

REMOVAL & INSTALLATION

MPV

1. Raise and safely support the vehicle.
 2. Remove the splash shields.
 3. Support the rear axle with a floor jack.
 4. Remove the stabilizer bar.
 5. Disconnect the height sensor or rebound spring bracket at the differential.
 6. Disconnect the parking brake cable at the differential bracket.
 7. Disconnect the shock absorbers at the axle and swing them out of the way.
 8. Disconnect the brake line at the axle and plug the line.
 9. Lower the axle slowly until the springs are free. Remove them.
 10. Installation is the reverse of removal. Install all fasteners hand tight. Lower the vehicle to the ground, then torque all fasteners: Note the following torques:
- Shock absorber—76 ft. lbs.
 - Height sensor—104 inch lbs.
 - Rebound spring bracket—19 ft. lbs.
 - Stabilizer bar clamp—38 ft. lbs.
 - Parking brake cable clamp—19 ft. lbs.

Leaf Spring

REMOVAL & INSTALLATION

Except MPV

1. Raise and support the vehicle so that the leaf spring is hanging freely.
2. Support the rear axle to remove the weight from the spring.
3. Disconnect the lower shock absorber mount.
4. Remove the spring U-bolts and plate.
5. Remove the spring rear pivot bolt.
6. Remove the front shackle nuts and shackle.
7. Remove the spring from the vehicle.
8. Installation is the reverse of the removal procedure. Torque the spring rear shackle-to-frame nut to 47–58 ft. lbs.; the rear shackle-to-spring nut to 72 ft. lbs.; the U-bolt nuts to 47–58 ft. lbs. (88–100 ft. lbs. 4WD) and the front spring pin nut to 18 ft. lbs.

Upper Link

REMOVAL & INSTALLATION

MPV

1. Raise and safely support the vehicle.
2. Unbolt the link at the frame and axle. Remove it.
3. Installation is the reverse of removal. Hand tighten the bolts, lower

the vehicle to the ground, then torque the bolts to 127 ft. lbs.

Lower Link

REMOVAL & INSTALLATION

MPV

1. Raise and safely support the vehicle.
2. Unbolt the link at the frame and axle. Remove the link.
3. Installation is the reverse of removal. Hand tighten the bolts, lower the vehicle to the ground, then torque the bolts to 127 ft. lbs.

Lateral Rod

REMOVAL & INSTALLATION

MPV

1. Raise and safely support the vehicle.
2. Unbolt the rod at the frame and axle. Remove the rod.
3. Installation is the reverse of removal. The rod is installed with the stamped mark towards the body. Hand tighten the bolts, lower the vehicle to the ground, then torque the bolts to 127 ft. lbs.

Height Sensor

REMOVAL & INSTALLATION

MPV

1. Raise and safely support the vehicle.

Rear suspension components—MPV

2. Lower the spare tire about 300mm (12 in.).

3. Disconnect the wiring.

4. Remove the bolts and remove the sensor.

5. Installation is the reverse of removal. Torque the bolts to 20 ft. lbs.

ADJUSTMENT

1. Measure the length of the height sensor between the 2 locknuts on the sensor rod. Length should be 55mm.

2. If not, loosen the 2 nuts and turn the center section to adjust the length.

Ride height sensor adjustment points — MPV

① Basic timing: 5B

Actual timing: 8B

② Basic timing: 5B

Actual timing: 15B

③ Jet valve clearance: 0.010 in. (0.25 mm)

FIRING ORDERS

NOTE: To avoid confusion, always replace spark plug wires one at a time.

Mitsubishi 2.0L, 2.4L and 2.6L
Firing order: 1-3-4-2
Distributor rotation: clockwise

Mitsubishi 3.0L
Firing order: 1-2-3-4-5-6
Distributor rotation: clockwise

ENGINE ELECTRICAL

NOTE: Disconnecting the negative battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is reconnected.

Distributor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. To gain access to the distributor on the Van:
 - a. Remove the battery cover.
 - b. Disconnect the negative battery cable.

- c. Release the 2 catches and flip the passenger seat up.
- d. Remove the driver's seat.
- e. Remove the parking brake lever cover.

- f. Remove the parking brake lever and fuel filler fuel release lever retaining screws and remove the levers from the seat under frame.

- g. Remove the seat under frame retaining screws and remove the seat under frame from the vehicle.

3. Disconnect the distributor pickup lead wires and vacuum hose(s), if equipped.

4. Unfasten the distributor cap retaining clips or screws and lift off the distributor cap with all ignition wires still connected. Remove the coil wire if necessary.

5. Matchmark the rotor to the distributor housing and the distributor housing to the engine.

NOTE: Do not crank the engine during this procedure. If the en-

gine is cranked, the matchmark must be disregarded.

6. Remove the retaining nut and remove the distributor from the engine.
To install:

7. Install a new distributor housing O-ring.

8. Install the distributor in the engine so the rotor is lined up with the matchmark on the housing and the housing is lined up with the matchmark on the engine. Make sure the distributor is fully seated and that the distributor shaft is fully engaged.

9. If the engine has been cranked, position the engine so that the No. 1 piston is at TDC of the compression stroke and the mark on the vibration damper is lined up with 0 on the timing indicator. Then install the distributor so the rotor is aligned with the position of the No. 1 ignition wire on the distributor cap.

NOTE: There are distributor cap runners inside the cap on vehicles with a 3.0L engine. Make sure the rotor is pointing to where the No. 1 runner originates inside the cap and not where the No. 1 ignition wire plugs into the cap.

10. Install the retaining nut and snug it. Connect the vacuum hose(s), if equipped.

11. Connect the distributor pickup lead wires.

12. Install the distributor cap and snap the retaining clips into place or tighten the screws.

13. Connect the negative battery cable.

14. Adjust the ignition timing and tighten the retaining nut.

Ignition Timing ADJUSTMENT

Carbureted Engine

1. Start the engine, set the parking

Distributor cap terminal routing viewed from the top of the cap—3.0L engine

Tachometer terminal — 1987-89 Pick-Up and Ram 50

Tachometer terminal and Ignition timing adjusting connector — Montero and Raider with 3.0L engine

Tachometer connector — Van

brake and run the engine until at normal operating temperature. Keep all lights and accessories **OFF** and place the transmission in neutral.

2. Connect a conventional power timing light to the No. 1 cylinder spark plug wire.

3. Connect the red lead of a tachometer to the negative primary terminal of the coil and connect the black lead to a good ground. Set the idle speed to specifications.

4. On 1986-87 vehicles, if working at an altitude of 3900 ft. (1200 meters) or higher, disconnect and plug the vacuum hose to the distributor diaphragm, turn the engine off and then restart the engine. On 1988-89 vehicles at the same altitude, disconnect and plug the white-striped hose running to the sub-vacuum chamber on the bottom of the distributor. (This step also applies to California engines equipped with dual-diaphragm distributor).

5. Aim the timing light at the timing scale.

6. Loosen the distributor nut just enough so the distributor can be rotated.

7. Turn the distributor in the proper direction until the specified timing is reached. Tighten the nut and recheck the timing.

8. Turn the engine off and connect the vacuum hose. Start the engine and check the timing with the vacuum hose plugged in. This reading should be basic timing plus 5 degrees.

9. Turn the engine off and remove all test equipment.

Fuel Injected Engine

1. Start the engine, set the parking brake and run the engine until at normal operating temperature. Keep all lights and accessories **OFF** and place the transmission in neutral.

2. Without unplugging the connector, insert a paper clip into the tachometer terminal. Connect the red lead of a tachometer to the paper clip and connect the black lead to a good ground. Set the idle speed to specifications.

3. Turn the engine off. Remove the water-proof cover from the ignition timing adjusting connector. Connect a jumper wire from the ignition timing adjusting terminal to a good ground.

4. Connect a conventional power timing light to the No. 1 cylinder spark plug wire. Start the engine and run at idle.

5. Aim the timing light at the timing scale.

6. Loosen the distributor nut just enough so the distributor can be rotated.

7. Turn the distributor in the prop-

2.4L Engine

3.0L Engine

Tachometer connector—1990 Pick-Up and Ram 50

Ignition timing adjustment connector—1987-89 Van

Ignition timing adjustment connector—1990 Van

er direction until the specified timing is reached. Tighten the nut and recheck the timing. Turn the engine off.

8. Remove the jumper wire from the ignition timing adjusting terminal and install the water-proof cover.

9. Start the engine and check the actual ignition timing. This reading should be 3 degrees more than basic timing for the 2.4L engine and 10 degrees more than basic timing for the 3.0L engine. This value may increase according to the altitude. As long as the basic timing is correct, the vehicle is timed correctly.

NOTE: The actual timing may fluctuate according to the control mode of the engine control unit; this is normal. As long as the timing did not fluctuate when basic timing was checked, there is no problem.

10. Turn the engine off and remove all test equipment.

Alternator

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

BELT TENSION ADJUSTMENT

Except 3.0L Engine

1. Loosen the pivot bolt slightly.
2. Raise the vehicle and support safely if necessary. Loosen the adjuster slot bolt just enough so the alternator can be moved.

3. On Montero, Raider and 1986 Pick-Up and Ram 50, use a suitable pry bar and apply tension to the alternator until the belt deflects about $\frac{1}{4}$ – $\frac{1}{2}$ in. under a 10 lb. load. All other vehicles are equipped with a bracket with an adjuster bolt. First loosen the brace bolt and tighten the adjustment bolt until the belt deflects about $\frac{1}{4}$ – $\frac{1}{2}$ in. under a 10 lb. load.

5. Torque the adjuster strap bolt to 10 ft. lbs. (15 Nm). Torque the pivot bolt to 16 ft. lbs. (23 Nm).

3.0L Engine

1. Loosen the tensioner pulley locknut.
2. Turn the adjusting bolt until the belt deflects about $\frac{1}{4}$ – $\frac{1}{2}$ in. under a 10 lb. load.
3. Tighten the locknut.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the alternator cover, if equipped.

3. Remove the alternator adjustment bolt or loosen the tensioner and remove the belt.

4. Remove the alternator brace bolt(s), nut(s) and applicable spacers.

5. Remove the alternator from the mounting bracket, label and disconnect all wires from the rear of the unit.

To install:

6. Connect all wiring to their proper terminals on the rear of the alternator.

7. Position the alternator in the mounting bracket.

8. Install the alternator brace bolt(s), nut(s) and applicable spacers.

9. Wrap the belt around the pulley and install the alternator adjustment bolt, if equipped. Adjust the belt tension and tighten the bolts.

10. Install the alternator cover, if equipped.

11. Connect the negative battery cable and check the alternator for proper operation.

Starter

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Raise the vehicle and support safely.

3. Remove the starter cover, if equipped.

4. Label and disconnect the wiring to the starter motor.

5. Remove the starter mounting bolts.

6. Remove the starter motor from the vehicle.

7. The installation is the reverse of the removal procedure. Torque the mounting bolts to 20–25 ft. lbs. (27–34 Nm).

Typical blower motor removal and installation—except Van

Front heater blower motor removal and installation—Van

CHASSIS ELECTRICAL

Heater Blower Motor REMOVAL & INSTALLATION

Montero and Raider

1. Disconnect the negative battery cable.

2. On some vehicles, the blower motor is not accessible without removing the blower motor housing.

a. Remove the lap heater duct.

b. Open the glove box lid and re-

lease the glove box stoppers. Remove the glove box from its hinge.

c. Use a small suitable prying device to remove the clip that holds the air selection control cable.

d. Disconnect the air selection control cable from the end of the air selection damper lever.

e. Remove the air distribution duct from the left side of the blower assembly.

f. Disconnect the connector to the resistor block and remove the grounding bolt.

g. Remove the blower housing mounting bolts and remove the housing from the vehicle.

h. Remove the resistor block and vent hose from the housing.

3. Remove the blower motor retaining screws and remove the assembly from the housing. Remove the fan from the motor.

To install:

4. Inspect the gasket for cracking or breaks and replace or repair it as required. Install to the blower motor.

5. Install the fan to the blower motor shaft. Install the blower assembly to the housing and install the retaining screws.

6. If the heater box was removed:

a. Install the vent hose and resistor block.

- b. Install the assembled blower housing to the vehicle.
- c. Position the ground wire and install the grounding bolt.
- d. Connect the resistor block connector.

e. Install the air distribution duct to the blower housing.

f. Move the air selection control lever to the recirculation position. Pull the air selection control damper lever up and connect the air selection control cable to the end of the air selection damper lever. Secure the cable with the clip.

g. Install the lap heater duct, glove box and stopper.

7. Connect the negative battery cable and check the blower motor for proper operation.

Pick-Up and Ram 50

1. Disconnect the negative battery cable. On 1986 vehicles, remove the fan switch knob, heater control knobs and radio knobs and remove the instrument panel bezel.

2. Disconnect the blower motor connector.

3. Remove the blower motor retaining screws and remove the assembly from the housing.

4. Remove the fan from the motor.

5. The installation is the reverse of the removal procedure.

Van

FRONT HEATER UNIT

1. Disconnect the negative battery cable.

2. Remove the lap heater duct.

3. Remove the left side defroster duct.

4. Disconnect the resistor block connector.

5. Remove the resistor block.

6. Remove the blower motor retaining screws and remove the assembly from the housing.

7. Remove the fan from the motor.

8. The installation is the reverse of the removal procedure.

REAR HEATER UNIT

1. Disconnect the negative battery cable.

2. Disconnect the blower motor connector.

3. Remove the blower motor cover.

4. Remove the vent hose.

5. Remove the blower motor retaining screws and remove the assembly from the housing. Remove the fan from the motor.

6. The installation is the reverse of the removal procedure.

- | | |
|-------------------------|--------------------|
| 1. Wiper arm assembly | 6. Cap |
| 2. Wiper blade | 7. Wiper pivot nut |
| 3. Wiper arm | 8. Washer |
| 4. Instrument panel | 9. Wiper linkage |
| 5. Wiper motor assembly | |

Front wiper system - Van

Front Windshield Wiper Motor

REMOVAL & INSTALLATION

Except Van

1. Disconnect the negative battery cable.

2. Disconnect the wiper motor connector.

3. Remove the wiper motor retaining bolts and pull the motor out far enough to gain access to the wiper linkage.

4. Matchmark and pry the wiper linkage from the motor output shaft.

5. Remove the wiper motor from the vehicle.

6. The installation is the reverse of the removal procedure.

Van

1. Disconnect the negative battery cable.

2. Remove the steering wheel and column covers.

3. If the vehicle is equipped with a tilt column, lower it to its lowest position. If the vehicle is not equipped with a tilt column, remove the combination switch.

4. Remove the brake fluid level inspection cover on the left side of the instrument panel.

5. Remove the lap heater ducts. Remove the switch panel and remove the instrument cluster assembly.

6. Remove the brake fluid reservoir mounting screws. Do not allow fluid to spill out onto any painted surface; brake fluid will ruin the paint.

7. Remove the heater control knobs and remove the center panel.

8. Remove the heater control mounting screws and push the control panel into the instrument panel.

9. Disconnect the harnesses below the center of the instrument panel.

10. Remove the radio.

11. Remove the mounting screws across the bottom of the instrument panel.

12. Remove the bolt covers across the top of the instrument panel and remove the bolts.

13. Remove the defroster ductwork from the heater unit.

14. Carefully remove the instrument panel from the vehicle.

15. Disconnect the wiper motor connector.

16. Remove the wiper motor retaining bolts and pull the motor out far enough to gain access to the wiper linkage.

17. Matchmark and pry the wiper linkage from the motor output shaft.

18. Remove the wiper motor from the vehicle.

To install:

19. Position the wiper motor and connect the linkage.

20. Install the motor retaining bolts and connect the connector. Make sure the motor works properly in all modes before installing the remaining parts.

Typical combination switch mounting

Disconnect the battery before proceeding.

21. Install the instrument panel and all related parts. Adjust control cables if necessary.

22. Install the combination switch, if it was removed. Install the steering wheel and column covers.

23. Connect the negative battery cable.

24. Check the entire climate control system and all gauges for proper operation.

Rear Wiper Motor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Tilt the wiper mount nut cover up and remove the nut. Remove the wiper arm from the shaft. Remove the wiper pivot nut and washer, if equipped.

3. Remove the tailgate or back door trim and waterproof film.

4. Disconnect the wiper motor connector.

5. Remove the wiper motor retaining bolts and remove the motor from the vehicle.

6. The installation is the reverse of the removal procedure.

Combination Switch

REMOVAL & INSTALLATION

NOTE: The combination switch

Typical instrument cluster mounting

incorporates the windshield, headlight, dimmer, and turn signal switches into a single switch assembly.

1. Disconnect the negative battery cable.

2. Remove the steering wheel pad. Matchmark and remove the steering wheel.

3. If the vehicle is equipped with a tilt steering column, put the column in its lowest position.

4. Remove the upper and lower column covers.

5. Remove the wiring harness band and disconnect the harness.

6. Remove the combination switch

mounting screws and remove the switch.

7. The installation is the reverse of the removal procedure. Torque the steering wheel nut to 30 ft. lbs. (41 Nm).

Instrument Cluster

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. On 1986 Pick-Up and Ram 50, remove the fan switch knob, heater control knobs and radio knobs and remove the instrument panel bezel. On 1987-90 Pick-Up and Ram 50, remove the hazard flasher switch and the matching cover on the other side of the column.

3. Remove the instrument cluster hood retaining screws and remove the hood. Remove the instrument cluster retaining screws.

4. Pull the cluster out, unclip the speedometer cable from the speedometer and unplug all connectors from the rear of the cluster.

5. Remove the cluster from the vehicle.

6. Remove the cover and glass. Remove the retaining screws and remove the speedometer, gauges, etc. as required.

7. The installation is the reverse of the removal procedure.

Radio

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the fan switch knob, heater control knobs and radio knobs, as required.

3. Remove the instrument panel bezel, center panel or center console.

4. Remove the radio or radio bracket retaining screws, pull the radio out and unplug the connector(s) and antenna.

5. Remove the radio assembly.

Ignition Switch and Lock

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. If the vehicle is equipped with a tilt steering column, put the column in its lowest position.

3. Remove the upper and lower column covers.

4. Remove the wiring harness band

Typical ignition switch and lock assembly

and disconnect the ignition switch harness.

5. Remove the ignition switch to lock attaching screws, if equipped and remove the switch from the lock.

6. Using a hacksaw blade, cut a groove into the head of the special ignition switch and lock assembly mounting screws and remove the screws.

7. Remove the assembly from the steering column.

To install:

8. With the key inserted in the switch, install the switch and lock assembly to the steering column. Tighten the screws gradually making sure the key does not bind at any time.

9. If using the special break-off bolts, tighten them until the heads break off.

10. Connect the switch harness and check the assembly for proper operation.

11. Install the upper and lower column covers.

Stoplight Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Unplug the connector to the switch.

3. Remove the locknut and remove the switch from its mount bracket.

4. The installation is the reverse of the removal procedure.

5. Adjust the switch so that the brake lights come on only when the brake pedal is pushed and turn off when the pedal is released.

Clutch Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Unplug the connector to the switch.

3. Remove the locknut and remove the switch from its mount bracket.

4. The installation is the reverse of the removal procedure.

5. Adjust the switch so that the distance from the floorboard to the face of the pedal pad is 7½ in. for Montero and Raider or 6½ in. for Pick-Up and Ram 50.

6. Make sure the cruise control system is not operational when the pedal

Headlight circuit fuse location - 1986-90 Montero and Raider

Air conditioning fuse location—1987-90 Montero and Raider

Electric door locks fuse location—1989 Montero and Raider

Electric door locks fuse location—1990 Montero and Raider

Sunroof fuse location—1989-90 Montero

is pushed in and does operate properly with the pedal released.

Fuses and Circuit Breakers

LOCATION

Montero and Raider

The main fuse block is located on the left side of the instrument panel, covered by a removeable access panel. There are also several dedicated fuses located throughout the vehicle.

Pick-Up, Ram 50 and Van

The fuse block is located to the left of

the steering column, covered by a removeable access panel or mounted to the left kick-panel.

ENGINE COOLING

Radiator

REMOVAL & INSTALLATION

Except Van

1. Disconnect the negative battery cable.

2. Drain the radiator.

3. Remove the upper hose and coolant reserve tank hose from the radiator.

4. Remove the shroud assembly from the radiator.

5. Raise the vehicle and support safely.

6. Remove the lower hose from the radiator.

7. Disconnect and plug the automatic transmission cooler hoses, if equipped. Lower the vehicle.

8. Remove the mounting screws and carefully lift the radiator out of the engine compartment.

To install:

9. Lower the radiator into position and install the mounting screws.

10. Raise the vehicle and support safely. Connect the automatic transmission cooler hoses, if they were removed.

11. Connect the lower hose. Lower the vehicle.

12. Install the shroud assembly.

13. Connect the upper hose and coolant reserve tank hose.

14. Fill the system with coolant.

15. Connect the negative battery cable, run the vehicle until the thermostat opens, fill the radiator completely and check the automatic transmission fluid level, if equipped.

16. Check for leaks. Once the vehicle has cooled, recheck the coolant level.

Dual air conditioning fuse location—1989-90 Montero

Van

1. Disconnect the negative battery cable.
2. Release the 2 catches and flip the passenger seat up.
3. Remove the driver's seat.
4. Remove the parking brake lever cover.
5. Remove the parking brake lever and fuel filler fuel release lever retaining screws and remove the levers from the seat under frame.
6. Remove the battery cover, if necessary.
7. Remove the seat underframe retaining screws and remove the seat underframe from the vehicle.
8. Raise the vehicle and support safely. Drain the radiator.
9. Disconnect and plug the automatic transmission cooler hoses.
10. Remove the lower radiator mounting screws. Lower the vehicle.
11. Remove the upper hose and coolant reserve tank hose from the radiator.

12. Remove the shroud assembly from the radiator.
13. Remove the lower hose from the radiator.
14. Remove the upper mounting screws and carefully lift the radiator out of the engine compartment.

To install:

15. Lower the radiator into position and install the mounting screws.
16. Raise the vehicle and support safely. Connect the automatic transmission cooler hoses. Lower the vehicle.
17. Connect the lower hose.
18. Install the shroud assembly.
19. Connect the upper hose and coolant reserve tank hose.
20. Fill the system with coolant.
21. Connect the negative battery cable, run the vehicle until the thermostat opens, fill the radiator completely and check the automatic transmission fluid level.
22. Check for leaks. Once the vehi-

cle has cooled, recheck the coolant level.

23. Install the seat underframe and all related parts.

Heater Core

REMOVAL & INSTALLATION

Montero and Raider

1. Disconnect the negative battery cable.
2. Drain the coolant.
3. Remove the lap heater ducts and lower the hood release cable bracket.
4. Remove the side demister grills by carefully prying them from the instrument panel.
5. Remove the glove box and center console assembly. Remove the center reinforcement.
6. Remove the steering wheel.
7. Remove the instrument cluster.
8. Remove the oil pressure gauge,

Instrument panel assembly—Montero and Raider

inclinometer and voltmeter pod cover and remove the gauge assembly.

9. Label and disconnect the recirculation/fresh air door control cable.

10. Label and disconnect the mode selection control cable.

11. Label and disconnect the water valve control cable.

12. Remove the fuse box retaining screw and position the fuse box out of the way as far as it will go.

13. Remove the instrument panel retaining nuts and bolts and carefully remove the instrument panel from the vehicle.

14. Remove the air cleaner or air intake plenum, as required.

15. Disconnect the heater hoses from the heater core tubes.

16. Remove the duct from the top of the heater case.

17. Remove the retaining nuts and bolts and remove the heater case from the vehicle.

18. Remove the water valve cover and carefully remove the water valve from the case.

19. Remove the foot/defroster selection link from the mode selection lever.

20. Move the lever up to a position which will not interfere with the removal of the heater core.

21. Remove the heater core from the heater case. If the mode lever is in the way, remove it.

To install:

22. Install the heater core to the heater case. Install the mode lever, if it was removed.

23. Install the foot/defroster selection link to the mode selection lever.

24. Install the water valve assembly and its cover to the case.

25. Install the assembled heater case to the vehicle and install the retaining nuts and bolts.

26. Install the duct to the top of the case.

27. Connect the heater hoses to the core tubes and install the air cleaner or intake plenum.

28. Install the instrument panel and all related parts. Adjust the control cables if necessary.

29. Fill the system with coolant.

30. Connect the negative battery cable, run the vehicle until the thermostat opens and fill the radiator completely.

31. Check for leaks. Once the vehicle has cooled, recheck the coolant level.

32. Check the entire climate control system and all gauges for proper operation.

3. Place the water control valve (inside the cab) in the OFF position.

4. Remove the parcel tray, center ventilator grille and duct and the defroster duct.

5. Label and disconnect all cables from the heater case.

6. Disconnect the heater hoses from the heater core tubes.

7. Disconnect the blower motor connector.

8. Remove the top mounting bolts and center mounting nuts and remove the heater case from the vehicle.

9. Remove the heater core from the heater case.

10. The installation is the reverse of the removal procedure. If the heater hose grommets were disturbed, reseal them completely with suitable sealer.

11. Fill the system with coolant.

12. Connect the negative battery cable, run the vehicle until the thermostat opens and fill the radiator completely.

13. Check for leaks. Once the vehicle has cooled, recheck the coolant level.

14. Check the entire climate control system for proper operation. Adjust the control cables if necessary.

1987-90 Pick-Up and Ram 50

1. Disconnect the negative battery cable.

2. Drain the coolant. Disconnect the heater hoses from the core tubes.

3. Remove the hazard flasher switch and the matching cover on the other side of the column. Remove the instrument cluster.

4. Remove the fuse box cover and remove the fuse box retaining screws. Position the fuse box out of the way.

5. Remove the glove box assembly.

6. Remove the defroster ducts.

7. Label and disconnect the air, mode, and temperature control cables from the heater case.

8. Remove the front speaker grilles.

9. Remove the parcel box or clock, as equipped.

10. Remove the nut cover from the top center of the instrument panel.

11. Remove the center cover.

12. Remove the shifter knob and floor console assembly, if equipped.

13. Move the tilt steering column down as far as it will go.

14. Remove the instrument panel retaining nuts and bolts and carefully remove the instrument panel from the vehicle.

15. Remove the duct from the top center of the heater case.

16. Remove the defroster duct from the left side of the case.

17. Remove the center reinforcement braces.

18. Remove the mounting nuts and

remove the heater case from the vehicle.

19. Remove the hose cover, joint hose clamp and the plate from the case.

20. Remove the heater core from the case.

To install:

21. Install the heater core to the heater case.

22. Install the plate, joint hose clamp and hose cover.

23. Install the assembled heater case to the vehicle. Connect the heater hoses to the core tubes.

24. Install the center reinforcement braces.

25. Install the defroster and center ducts to the case.

26. Install the instrument panel and all related parts. Adjust the control cables if necessary.

27. Fill the system with coolant.

28. Connect the negative battery cable, run the vehicle until the thermostat opens and fill the radiator completely.

29. Check for leaks. Once the vehicle has cooled, recheck the coolant level.

30. Check the entire climate control system and all gauges for proper operation.

Van

FRONT HEATER CORE

1. Disconnect the negative battery cable.

2. Drain the coolant.

3. Remove the steering wheel and column covers. If the vehicle is equipped with a tilt column, lower it to its lowest position. If the vehicle is not equipped with a tilt column, remove the combination switch.

4. Remove the brake fluid level inspection cover on the left side of the instrument panel.

5. Remove the lap heater ducts. Remove the switch panel and remove the instrument cluster assembly.

6. Remove the brake fluid reservoir mounting screws. Do not allow fluid to spill out onto any painted surface; brake fluid will ruin the paint.

7. Remove the heater control knobs and remove the center panel.

8. Remove the heater control mounting screws and push the control panel into the instrument panel.

9. Disconnect the harnesses below the center of the instrument panel.

10. Remove the radio.

11. Remove the mounting screws across the bottom of the instrument panel.

12. Remove the bolt covers across the top of the instrument panel and remove the bolts.

13. Remove the defroster ductwork from the heater unit.

1986 Pick-Up and Ram 50

1. Disconnect the negative battery cable.

2. Drain the coolant.

11. Instrument panel wiring harnesses
12. Antenna cable
13. Radio bracket mounting screws
14. Instrument panel attaching screws
15. Screw covers
16. Instrument panel mounting bolts
17. Instrument panel

14. Carefully remove the instrument panel from the vehicle.

15. Remove the instrument panel frame and the control panel from the vehicle.

16. Raise the vehicle and support safely. Disconnect the heater hoses from the heater core tubes.

17. Label and disconnect all cables from the heater case. Remove the heater case mounting bolts. Tilt the case away from the bracket and remove it from the vehicle.

18. Disassemble the heater case and remove the heater core.

To install:

19. Install the heater core to the heater case.

20. Install the assembled case to the vehicle, making sure the floor pan seal is seated properly.

21. Connect the heater hoses to the core tubes. Make sure the hoses are not twisted and that the clamps are not touching other parts.

22. Install the instrument panel frame and position the heater control panel.

23. Install the instrument panel and

all related parts. Adjust the control cables if necessary.

24. Install the combination switch, if it was removed. Install the steering wheel and column covers.

25. Fill the system with coolant.

26. Connect the negative battery cable, run the vehicle until the thermostat opens and fill the radiator completely.

27. Check for leaks. Once the vehicle has cooled, recheck the coolant level.

28. Check the entire climate control system and all gauges for proper operation.

REAR HEATER CORE

1. Disconnect the negative battery cable.

2. Drain the coolant.

3. Disconnect the heater hoses from the core tubes.

4. Remove the air duct assembly from the heater case.

5. Remove the blower motor cover and remove the blower motor.

6. Remove the upper half of the case.

7. Remove the heater core from the case.

8. The installation is the reverse of the removal procedure. When attaching the upper half of the case, make sure the duct seals do not get dislodged.

9. Fill the system with coolant.

10. Connect the negative battery cable, run the vehicle until the thermostat opens and fill the radiator completely.

11. Check for leaks. Once the vehicle has cooled, recheck the coolant level.

12. Check the rear heater system proper operation.

Water Pump

REMOVAL & INSTALLATION

2.0L and 2.4L Engines

1. Disconnect the negative battery cable.

2. Drain the antifreeze. On the Van, remove the seat under frame.

1. Heater hose
2. Heater hose
3. Heater hose
4. Heater hose
5. Water pipe
6. Lap heater duct
7. Defroster duct
8. Instrument panel
9. Frame assembly
10. Heater control assembly
11. Air duct
12. Air flow box
13. Front heater unit
14. Joint duct

Front heater case and related parts—Van

3. Remove the upper radiator shroud.

4. Remove the air conditioning compressor tensioner pulley, if equipped and remove all belts.

5. Remove the cooling fan assembly along with the water pump pulley.

6. Disconnect the radiator hose from the water pump.

7. Remove the crankshaft pulley(s).

8. Remove the timing belt(s).

9. The water pump bolts are different lengths, so note their positions before removing them. Remove the water pump mounting bolts and remove the pump from the block and the water pipe connection. Remove the O-ring from the water pipe connection.

To install:

10. Thoroughly clean and dry the mating surfaces of the block and water

pump. Install a new O-ring to the water pipe connection.

11. Install the water pump with a new gasket to the block and torque the bolts (except the bolt that goes through the alternator bracket) to 10 ft. lbs. (13 Nm). Torque the aforementioned bolt to 17 ft. lbs. (23 Nm).

12. Install the timing belt(s) and covers.

13. Install the crankshaft pulley(s).

14. Connect the radiator hose to the water pump.

15. Install the water pump pulley and cooling fan assembly.

16. Install the air conditioning compressor tensioner pulley, if equipped and install and adjust the belts.

17. Install the upper radiator shroud.

18. Fill the system with coolant.

19. Connect the negative battery ca-

ble, run the vehicle until the thermostat opens and fill the radiator completely.

20. Check for leaks. Once the vehicle has cooled, recheck the coolant level.

21. Install the seat underframe and all related parts, if it was removed.

2.6L Engine

1. Disconnect the negative battery cable.

2. Drain the antifreeze.

3. Remove the upper radiator shroud, if equipped.

4. Remove the cooling fan assembly along with the water pump pulley.

5. Remove all belts.

6. Disconnect the radiator hose and heater hose from the water pump.

7. The water pump bolts are different lengths, so note their positions be-

Rear heater assembly - Van

fore removing them. Remove the water pump retaining bolts and remove the water pump from the timing chain cover.

8. The installation is the reverse of the removal procedure. Torque the water pump and pulley bolts to 10 ft. lbs. (13 Nm).

3.0L Engine

1. Disconnect the negative battery cable.

2. Drain the antifreeze. Remove the upper radiator hose and the upper radiator shroud.

3. Remove the cooling fan assembly along with the water pump pulley. Remove all belts.

4. Remove the power steering pump from the bracket and remove the bracket.

5. Remove the tensioner pulley bracket, the air conditioning compressor and its bracket.

6. Remove the cooling fan bracket assembly. Remove the crankshaft pulley and flange.

7. Remove the timing belt covers. If the same timing belt will be reused, mark the direction of the timing belt's

rotation, for installation in the same direction. Make sure the engine is positioned so the No. 1 cylinder is at the TDC of its compression stroke and the sprockets timing marks are aligned with the engine's timing mark indicators.

8. Loosen the timing belt tensioner bolt and remove the belt. Position the tensioner as far away from the center

of the engine as possible and tighten the bolt. Remove the water pump mounting bolts, separate the pump from the water inlet pipe and remove the pump from the engine. Remove the water inlet fitting from the pump.

To install:

9. Thoroughly clean and dry the mating surfaces of the block and water pump. Install a new O-ring to the water inlet pipe. Install the pump and water inlet fitting with new gaskets to the engine and water pipe. Torque the water pump mounting bolts to 20 ft. lbs. (27 Nm).

10. If not already done, position both camshafts so the marks line up with those on the alternator bracket and inner timing cover. Rotate the crankshaft so the timing mark aligns with the mark on the oil pump.

11. Install the timing belt on the crankshaft sprocket and while keeping the belt tight on the tension side (right side), install the belt on the front camshaft sprocket.

12. Install the belt on the water pump pulley, then the rear camshaft sprocket and the tensioner.

13. Rotate the front camshaft counterclockwise to tension the belt between the front camshaft and the crankshaft. If the timing marks came out of line, repeat the procedure.

14. Install the crankshaft sprocket flange.

15. Loosen the tensioner bolt and allow the spring to tension the belt.

16. Turn the crankshaft 2 full turns in the clockwise direction only until the timing marks align again. Now that the belt is properly tensioned, torque the tensioner lock bolt to 21 ft. lbs. (29 Nm).

17. Install the timing belt covers and all related parts.

18. Fill the cooling system.

19. Connect the negative battery cable, run the vehicle until the thermo-

Water pump assembly - 3.0L engine

stat opens and fill the radiator completely.

20. Check for leaks. Once the vehicle has cooled, recheck the coolant level.

Thermostat

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Drain the coolant down to thermostat level or below.

2. Disconnect the engine coolant temperature switch connector, if equipped.

3. Remove the thermostat housing.

4. Remove the thermostat and discard the gasket.

5. Clean the housing mating surfaces and use a new gasket.

6. The installation is the reverse of the removal procedure.

COOLING SYSTEM BLEEDING

All engines are equipped with self-bleeding thermostats. Cooling system bleeding is not necessary in any vehicles when servicing the cooling system.

Fuel pump harness connector at the rear of the fuel tank — Montero and Raider

Fuel pump harness connector at the rear of the fuel tank — Pick-Up and Ram 50

FUEL SYSTEM

Fuel System Precaution

RELIEVING FUEL SYSTEM PRESSURE

1. Disconnect the fuel pump harness connector.

2. Start the engine and allow the engine to run itself out of fuel.

3. Once the engine has stalled, turn the key to the OFF position and connect the connector.

4. Disconnect the negative battery cable so the pressure cannot build up until work has been completed.

Fuel Filter

REMOVAL & INSTALLATION

Carbureted Engine

1. Disconnect the negative battery cable.

2. Raise the vehicle and support safely, if necessary.

3. Remove the air cleaner assembly, if necessary. Remove the fuel filter from its bracket. Inspect the hoses carefully.

Fuel pump harness connector at the left of the transmission extension housing — Van

4. Install the new filter, hoses and clamps if damaged.

5. Connect the negative battery cable, start the engine and check for leaks.

Fuel Injected Engine

CAUTION

Do not use conventional fuel filters, hoses or clamps when servicing this fuel system. They are not compatible with the injection system and could fail, causing personal injury or damage to the vehicle. Use only replacement parts specifically designed for fuel injection.

1. Relieve the fuel pressure.
2. Disconnect the negative battery cable.

3. Raise the vehicle and support safely.

4. Remove the fuel filter protector plate, if equipped.

5. Disconnect the main and high pressure lines. Remove any other fuel hose that is damaged in any way.

6. Remove the filter mounting bolts and remove the filter from the vehicle.

To install:

7. Install the new filter to the vehicle using new gaskets. Replace any hoses that were damaged.

8. Install the protector plate, if equipped.
9. Connect the negative battery cable, check for leaks and road test the vehicle.

Mechanical Fuel Pump

PRESSURE TESTING

1. Raise the vehicle and support safely.
2. Connect a suitable pressure gauge to the fuel pump outlet fitting.
3. Crank the engine several times while observing the gauge.
4. The pump should develop 3–4 psi of pressure.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Disconnect the fuel lines from the pump and plug them.

NOTE: There is a fuel pump pushrod in the 2.0L engine. When removing or installing the pump, be careful not to drop the pushrod because it will most likely drop down to the oil pan.

Also, it may be necessary to remove the rear thermostat housing bolt and/or the valve cover on the 2.6L engine to remove and install the pump.

3. Remove the fuel pump retaining bolts or nuts and remove the pump from the engine. Remove the pushrod, if equipped.
4. Clean and dry the mounting surfaces, bolts and bolt holes.
5. The installation is the reverse of the removal procedure. Use new gaskets and a new insulator.
6. Connect the negative battery cable, start the engine and check for leaks.

Electric Fuel Pump

PRESSURE TESTING

1. Relieve the fuel pressure.
2. Disconnect the negative battery cable.
3. Cover the high pressure fuel hose with a clean shop rag to prevent fuel spray from residual pressure in the line. Disconnect the high pressure fuel hose at the delivery pipe.
4. Connect the proper fuel pressure gauge and accompanying special adaptor tools to the delivery pipe.
5. If not already done, place the key in the OFF position. Connect the negative battery cable.
6. Connect a jumper wire from the

Fuel pump activation terminal – Montero and Raider

Fuel pump activation terminal located behind the fuse box – Pick-Up and Ram 50

Fuel pump activation terminal – Van

Fuel pressure testing equipment – except Van. The hose is not used on Pick-Up and Ram 50 with 2.4L engine

Fuel pressure gauge installation—3.0L engine

Fuel pressure gauge installation—Pick-Up and Ram 50 with 2.4L engine

Fuel pressure gauge installation—Van

fuel pump activation terminal to the positive battery post. This will pressurize the system so that the fuel pump installation assembly can be inspected for leaks. If a leak is found, repair it before proceeding.

7. Disconnect the jumper wire to stop the fuel pump.

8. Start the engine and allow it to idle.

9. Measure the pressure during idling. The specification for all applications is 38 psi.

10. Disconnect and plug the vacuum hose from the fuel pressure regulator.

11. With the hose disconnected, the

pressure should increase to about 50 psi.

12. Race the engine a few times to make sure the fuel pressure does not deviate from specifications.

13. Press on the return hose while racing the engine to make sure there is pressure in the hose. Reconnect the vacuum hose.

14. Stop the engine and allow pressure to remain in the system. There should be no decrease in pressure for at least 2 minutes.

15. Relieve the fuel pressure.

16. Remove the fuel pressure measuring equipment.

17. Connect the high pressure fuel hose to the delivery pipe using new O-rings where necessary.

18. Connect the jumper wire from the fuel pump activation terminal to the positive battery post inspect the system for leaks.

19. Road test the vehicle.

REMOVAL & INSTALLATION

Montero and Raider

1. Relieve the fuel pressure.

2. Disconnect the negative battery cable.

3. Remove the pump and sending unit access panel.

4. Cover the high pressure fuel hose with a clean shop rag to prevent fuel spray from residual pressure in the line. Disconnect the fuel hose and pipe from the pump.

5. Remove the fuel pump mounting screws and remove the pump from the tank.

6. The installation is the reverse of the removal procedure.

Pick-Up, Ram 50 and Van

1. Relieve the fuel pressure.

2. Disconnect the negative battery cable.

3. Raise the vehicle and support safely. Remove protective plates, if equipped.

4. Using the proper equipment, drain the fuel tank.

5. Disconnect all hoses, tubes and connectors that can be reached without lowering the tank.

6. Place a transmission jack or equivalent under the center of the tank and apply slight pressure.

7. Remove the retaining bolts and nuts and lower the tank.

8. Lower the tank enough to reach in and disconnect any remaining hoses, tubes and connectors.

9. Remove the tank. Remove the pump retaining screws and remove the pump from the tank.

To install:

10. Clean the seal area of the tank. Install a new gasket.

11. Install the pump in the same position as originally installed.

12. Install the retaining screws and torque them to 15 inch lbs.

13. Install the fuel tank and all related parts.

14. Connect the negative battery cable. Connect the jumper wire from the fuel pump activation terminal to the positive battery post inspect the system for leaks.

15. Road test the vehicle.

Fuel tank assembly—Van

Carburetor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Drain the radiator because the

choke control element is water activated.

2. Remove the air cleaner assembly.

3. Remove and install the fuel tank cap to relieve any pressure in the tank.

4. Matchmark all vacuum hoses

and electrical connectors and remove them from the carburetor.

5. Disconnect the throttle, cruise control, choke and kickdown cables and linkages, if equipped.

6. Disconnect and plug the fuel inlet line.

7. Remove the mounting bolts and remove the carburetor from the intake manifold.

To install:

8. Thoroughly clean and dry the mounting surface of the manifold and install a new base gasket.

9. Install the mounting bolts and tighten them alternately to compress the base gasket evenly. Final torque should be 12 ft. lbs. (16 Nm).

10. Connect the fuel line.

11. Connect the throttle, cruise control, choke and kickdown cables and linkages, if equipped.

12. Install all vacuum hoses and electrical connectors in their proper locations.

13. Install the air cleaner.

14. Fill the radiator.

15. Connect the negative battery cable, start the engine and perform all necessary adjustments.

Throttle body, fuel rail, injector and related parts—2.4L engine

IDLE SPEED ADJUSTMENT

1. Start the engine and allow it to reach normal operating temperature. Before checking or adjusting the idle speed, check ignition timing and adjust if necessary.

2. Turn all lights and accessories **OFF**. Connect a tachometer to the engine.

3. Open the throttle and run at 2500 rpm for 10 seconds. Allow the engine to idle for 2 minutes.

4. Check the idle speed. If the tachometer indicates rpm is not at specifications, turn the idle speed screw until the correct idle speed is obtained.

5. Once the idle speed is set, turn the air conditioning on to its coldest position, if equipped.

6. With the compressor running, set the idle to 900 rpm by turning the idle-up screw.

IDLE MIXTURE ADJUSTMENT

1. Drill a 2mm pilot hole in the casting around the idle mixture screw. Drive out the concealment plug.

2. Run the engine until at normal operating temperature.

3. Check and adjust the idle speed and ignition timing.

4. Turn the engine **OFF**.

5. Disconnect the negative battery cable for 5 seconds, then reconnect it.

6. Disconnect the oxygen sensor connector.

7. Open the throttle and run at 2500 rpm for 10 seconds. Allow the engine to idle for 2 minutes.

8. Using a suitable emissions tester, adjust the idle mixture screw until the CO at idle is below 0.30% and the idle is smooth.

9. Turn the engine **OFF**.

10. Connect the oxygen sensor connector.

11. Reinstall the concealment plug in the idle mixture screw hole.

SERVICE ADJUSTMENTS

For all carburetor service adjustment procedures and Specifications, please refer to "Carburetor Service" in the Unit Repair section.

Fuel Injection

IDLE SPEED ADJUSTMENT

The idle speed is automatically regulated by the idle speed control system. Do not attempt any adjustments or the fuel injection system may get out of calibration.

IDLE MIXTURE ADJUSTMENT

There is no idle mixture adjustment provided with any Mitsubishi fuel injection system.

Fuel Injector

REMOVAL & INSTALLATION

2.4L Engine

1. Relieve the fuel pressure.
2. Disconnect negative battery cable.

3. Drain the antifreeze. Remove the throttle body.

4. Remove the boost hose from opposite end of air plenum.

5. Cover the high pressure fuel hose with a clean shop rag to prevent fuel spray from residual pressure in the line. Disconnect the high pressure fuel hose from the fuel rail.

6. Remove the fuel return line and vacuum hose from the fuel pressure regulator.

7. Disconnect the electrical connectors from the injectors.

8. Remove the fuel rail retaining bolts.

9. Lift the rail with injectors attached up and away from the engine. Do not drop injectors during removal. If an injector should fall and hit the floor or other hard surface, it should not be reused.

10. Remove the injector from the rail with a gentle pull. Remove the lower insulator.

To install:

11. Install a new grommet and O-rings onto the injector. Coat the O-rings with a light coating of gasoline.

12. Install the injector to the rail, making sure that injector turns freely. If it does not turn, check for a jammed O-ring and re-insert.

13. Replace the insulators in the intake manifold. Install the fuel rail with injectors onto the manifold. Make sure the rubber bushings are correctly seated in the installation holes.

14. Tighten fuel rail retaining bolts to 18 ft. lbs. (10 Nm).

15. Install the fuel return line and vacuum hose to the fuel pressure regulator.

16. Connect the electrical connectors to the injectors.

17. Replace O-ring and connect the high pressure fuel line to delivery pipe.

18. Connect the boost hose to air plenum.

19. Install the throttle body using a new base gasket.

20. Refill the radiator. Connect the negative battery cable.

21. Connect the jumper wire from

the fuel pump activation terminal to the positive battery post inspect the system for leaks.

3.0L Engine

1. Relieve the fuel pressure.
2. Disconnect negative battery cable.

3. Remove the air intake hose from the throttle body.

4. Disconnect all wires, hoses and linkages to the throttle body.

5. Disconnect the EGR temperature sensor wire.

6. Remove the ignition coil.

7. Remove the engine oil filler neck bracket.

8. Unbolt the EGR tube from the air intake plenum.

9. Disconnect the PCV hose and vacuum hose cluster from the plenum.

10. Remove the plenum to engine brackets.

11. Unbolt the air intake plenum assembly from the intake manifold and remove.

12. Cover the high pressure fuel hose with a clean shop rag to prevent fuel spray from residual pressure in the line. Disconnect the high pressure fuel hose from the fuel rail.

13. Remove the fuel return line and vacuum hose from the fuel pressure regulator.

14. Remove electrical connectors from the injectors.

15. Remove the fuel rail retaining bolts.

16. Lift the rail with injectors attached up and away from the engine. If an injector should fall and hit the floor or other hard surface, it should not be reused.

17. Remove the injectors from the fuel rail with a gentle pull. Remove the lower insulator.

To install:

18. Install a new grommet and O-ring onto injector. Coat the O-ring with light coating of gasoline.

19. Install the injectors into the rail, making sure that injector turns freely. If it does not turn, check for a jammed O-ring and re-insert.

20. Replace the seats in the intake manifold. Install new rubber bushings onto mounting points of fuel rail. Install the assembled fuel rail with injectors onto the manifold.

21. Tighten the fuel rail bolts to 8 ft. lbs. (10 Nm).

22. Connect the electrical connectors to the injectors.

23. Connect the fuel return hose and the vacuum hose to the pressure regulator.

24. Using a new O-ring coated lightly with gasoline, install the high pressure fuel line.

ENGINE MECHANICAL

NOTE: Disconnecting the negative battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is reconnected.

Engine

REMOVAL & INSTALLATION

Except Van

1. Relieve the fuel pressure if the vehicle is equipped with fuel injection. Disconnect the negative battery cable from the battery and from the engine.
2. Matchmark and remove the hood. Remove the oil dipstick.
3. Raise the vehicle and support

safely. Remove the engine under cover. Drain the engine oil and coolant.

4. Remove the starter. Remove the lower radiator hose.

5. Remove the exhaust pipe from the exhaust manifold(s).

6. If the vehicle is equipped with a manual transmission, remove the transmission and all related parts.

7. If the vehicle is equipped with an automatic transmission, remove the inspection plate, matchmark the flex plate to the converter, remove the torque converter bolts and push the torque converter backwards as far as it will go. Remove the lower bell housing bolts. Lower the vehicle.

8. If the vehicle is equipped with a carburetor, remove the air cleaner assembly. Remove all ductwork and air intake hoses. Disconnect all linkages and cables from the carburetor or throttle body.

9. Cover the fuel line connections with a clean shop rag and disconnect and plug the fuel lines.

10. Without releasing the refrigerant, unbolt the air conditioning compressor from the engine and position it to the side, if equipped.

11. Remove the radiator and shroud. Remove the fan and all related parts. Disconnect the heater hoses.

12. Without disconnecting the lines, unbolt the power steering pump from its brackets and position it to the side, if equipped.

13. Remove the alternator. Remove the ignition coil and power transistor assembly, if equipped.

14. Label and disconnect all remaining electrical connectors, vacuum hoses and check for any other items preventing engine removal.

15. Attach an engine removal device to the engine support eyes on the engine.

16. If the vehicle is equipped with an automatic transmission, support the

transmission with a floor jack, or equivalent. Remove the remaining bell housing bolts.

17. Remove the engine mount nuts and remove the engine from the vehicle slowly and carefully.

To install:

18. Lower the engine into position and install the engine mount nuts. Torque the nuts to 20 ft. lbs. (27 Nm). Install the upper bell housing bolts. Remove the engine removal device. Install the oil dipstick.

19. Raise the vehicle and support safely.

20. Install the remaining bell housing bolts.

21. If the vehicle is equipped with a manual transmission, install the transmission and all related parts.

22. If the vehicle is equipped with an automatic transmission, align the torque converter and flex plate and install the bolts. Install the inspection plate and starter.

23. Install the exhaust pipe to the exhaust manifold(s) using new gaskets. Install the lower radiator hose. Lower the vehicle.

24. Connect the heater hoses.

25. Make sure the negative battery cable is not connected to the battery. Connect the engine side of the negative cable to the engine. Install the alternator, power steering pump and all brackets.

26. Install the air conditioning compressor.

27. Connect all linkages and cables to the carburetor or throttle body.

28. Install the ignition coil and power transistor assembly, if equipped. Connect all electrical connectors, vacuum hoses, etc. that were disconnected during the engine removal procedure.

29. Install the fan and all related parts. Adjust all belt tensions, if required.

Emissions warning lamp reset switch—Van

Emissions warning lamp reset switch—1987-90
Pick-Up and Ram 50

Identifying electrical connectors — Pick-Up and Ram 50 with 2.4L engine

30. Install the radiator, shroud and upper hose.

31. Install the air cleaner assembly, ductwork and air intake hoses.

32. Fill the engine with the specified amount of oil and fill the radiator with coolant.

33. Connect the negative battery cable and connect the jumper wire from the fuel pump activation terminal, if equipped, to the positive battery post to inspect the system for leaks.

34. Check the automatic transmission fluid level, if equipped. Set all adjustments to specifications.

34. Install and align the hood.

Van

1. Remove the seat underframe.
2. Relieve the fuel pressure.
3. Disconnect the negative battery cable.

CAUTION

The engine is removed from the bottom of the Van. Before attempting to remove the engine, obtain the special OTC support fixture, or equivalent, specifically designed for this operation. Do not attempt to remove the engine using a conventional transmission jack. Serious personal injury or damage to the engine or transmission may result if improper equipment is used because transmission jacks are not rated at the proper weight capacity for engine removal.

4. Drain the antifreeze. Remove the upper radiator hose.

5. Remove the radiator shroud, cooling fan and all drive belts.

6. Without disconnecting the lines, unbolt the power steering pump from its brackets and position it to the side.

7. Without releasing the refrigerant, unbolt the air conditioning compressor from the engine and position it to the side, if equipped.

8. Unbolt the battery ground cable from the block.

9. Remove the air intake hose from the throttle body.

10. Disconnect all linkages and cables from the throttle body.

11. Remove the alternator. Label and disconnect all remaining electrical connectors and vacuum hoses and check for any other items preventing engine removal that are only accessible from above the engine.

12. Raise the vehicle and support safely.

13. Matchmark the nut to the threads and remove both strut bars. Remove the driveshaft.

14. Remove the starter.

15. Disconnect the speedometer cable.

16. Alternator connector
17. Ignition coil and power transistor assembly
18. I.S.C. connector
19. Throttle position sensor connector
20. Coolant temperature switch connector (automatic transmission only)
21. Coolant temperature sensor connector
22. Thermo switch connector (automatic transmission only)
23. Coolant temperature sending unit connector
24. Emission control vacuum hose
25. Ground cable

Engine mounting components—Van

ble from the transmission. Disconnect the transmission harness connector.

16. Disconnect the transmission ground cable.

17. Remove the header pipe.

18. Disconnect the oil pressure sending unit wire.

19. Disconnect the transmission cooler lines.

20. Cover the fuel line connections with a clean shop rag and disconnect and plug the fuel lines.

21. Disconnect the transmission gear selector cable.

22. Disconnect and plug the heater hoses.

23. Support the engine safely and firmly with the proper adaptor and support fixture assembly.

24. Remove the rear engine mount installation bolt.

25. Remove the engine to crossmember installation bolts and nuts.

26. Carefully remove the engine and transmission assembly from the vehicle.

To install:

27. Raise the engine and transmission assembly into position and install to the vehicle. Install the engine to crossmember bolts and torque the nuts to 65 ft. lbs. (88 Nm).

28. Install the rear engine mount installation bolt and a new nut and torque the nut to 65 ft. lbs. (88 Nm).

29. Connect the heater hoses and secure the hose clamps.

30. Connect the transmission gear selector cable, speedometer cable, har-

ness connector, ground cable and cooler lines.

31. Install the driveshaft and torque the nuts to 40 ft. lbs. (54 Nm).

32. Install the starter.

33. Connect the fuel lines.

34. Connect the oil pressure sending unit wire.

35. Install the header pipe using a new gasket.

36. Install the strut bars and tighten the nuts until the matchmarks line up. Lower the vehicle.

37. Install the alternator.

38. Connect all electrical connectors and vacuum hoses that are accessible from above the engine.

39. Connect all linkages and cables to the throttle body.

40. Make sure the ground cable is not touching the battery post and connect the ground cable to the block.

41. Install the power steering pump and air conditioning compressor.

42. Install the drive belts, cooling fan and radiator shroud.

43. Install the air intake hose to the throttle body.

44. Fill the engine with the specified amount of oil and fill the radiator with coolant.

45. Connect the negative battery cable and connect the jumper wire from the fuel pump activation terminal to the positive battery post to inspect the system for leaks.

46. Check the automatic transmission fluid level. Set all adjustments to specifications.

47. Install the seat underframe.

Cylinder Head

REMOVAL & INSTALLATION

2.0L, 2.4L and 2.6L Engines

1. On the Van, remove the seat underframe. Rotate the engine around so the No. 1 cylinder is at TDC. If the engine is fuel injected, relieve the fuel pressure.

2. Drain the cooling system. Remove the upper radiator hose and disconnect the heater hoses.

3. Remove the dipstick bracket bolt.

4. Remove the air cleaner assembly or air intake hose.

5. Disconnect all linkages and cables from the throttle body. Disconnect and plug the fuel lines to the carburetor or fuel rail. Remove the valve cover.

6. On the 2.0L and 2.4L engines, perform the following:

a. Without disconnecting the lines, unbolt the power steering pump from its brackets and position it to the side, if equipped.

b. Remove the timing belt upper cover.

c. Align the timing mark, if it is not already aligned. Secure the timing belt to the sprocket with a sturdy wire tie.

d. Remove the camshaft bolt.

e. Remove the sprocket from the camshaft and allow it to rest on the lower cover. If this is not possible, tie it to a fabricated device so the belt remains taut and the timing is not lost.

← Timing belt side

Exhaust side

Intake side

Cylinder head bolt torque sequence—2.0L and 2.4L engines

94 N·m (69 FT. LBS.) COLD ENGINE
103 N·m (75 FT. LBS.) HOT ENGINE

18 N·m (156 IN. LBS.)

Cylinder head bolt torque sequence—2.6L engine

7. On the 2.6L engine, perform the following:

a. Matchmark the distributor gear to its drive gear and remove the distributor.

b. Remove the camshaft bolt and remove the distributor drive gear.

c. Remove the camshaft gear (with the chain installed) from the camshaft and allow it to rest on the holder just below it. This will hold the valve timing. Do not crank the engine until the distributor has been reinstalled or the timing will be lost and timing components could be damaged.

8. Disconnect and label all vacuum lines, hoses and wiring connectors from the manifolds, carburetor or throttle body and cylinder head.

9. Raise the vehicle and support safely.

10. Remove the exhaust pipe from the exhaust manifold. Lower the vehicle.

11. On the 2.6L engine, remove the small end bolts from the head first. Remove head bolts, starting from the outside and working inward.

12. Remove the cylinder head from the engine.

13. Clean the cylinder head gasket mating surfaces.

To install:

14. On the 2.6L engine, apply a thin

bead of sealant to the seam where the chain case and block meet. Install a new head gasket to the block and position the cylinder head assembly with all head bolts and washers. Torque the bolts in sequence to 30 ft. lbs. (41 Nm). Repeat the sequence increasing the torque to 50 ft. lbs. (68 Nm). Repeat the sequence a third time, increasing the torque to a final value of 69 ft. lbs. (94 Nm). On the 2.6L engine, tighten the small end bolts to 13 ft. lbs. (18 Nm) last.

15. Install the camshaft gear or sprocket. On the 2.6L engine, install the distributor drive gear, bolt and washer. Torque the bolt to 40 ft. lbs. (54 Nm). Install the distributor, aligning the matchmarks.

16. Install the timing belt cover, if equipped.

17. Install the power steering pump, if it was removed.

18. Connect the heater hoses.

19. Install the dipstick bracket bolt. Install the valve cover with a new gasket.

20. Connect and plug the fuel lines to the carburetor or fuel rail. Connect all linkages and cables from the throttle body.

21. Install the air cleaner assembly or air intake hose.

22. Connect the upper radiator hose.

23. Fill the radiator with coolant.

24. Connect the negative battery cable and connect the jumper wire from the fuel pump activation terminal to the positive battery post to inspect the system for leaks, if equipped.

25. Set all adjustments to specifications.

26. Install the seat underframe, if it was removed.

3.0L Engine

1. Relieve the fuel pressure. Disconnect the negative battery cable. Drain the cooling system. Disconnect the upper radiator hose.

2. Remove the drive belts, air conditioning compressor and power steering pump from the mounts and position them to the side.

3. Using a ½ in. drive breaker bar, insert it into the square hole of the serpentine drive belt tensioner, rotate it counterclockwise (to reduce the belt tension) and remove the belt.

4. Remove the alternator.

5. Remove the crankshaft pulley and the torsional damper.

6. To remove the timing belt, perform the following procedures:

a. Remove the covers. Rotate the crankshaft to position the No. 1 cylinder on the TDC of its compression stroke; the crankshaft sprocket timing mark should align with the oil pan timing indicator and the camshaft sprockets timing marks (triangles) should align with the rear timing belt covers timing marks.

b. Mark the timing belt in the direction of rotation for reinstallation purposes.

c. Loosen the timing belt tensioner and remove the timing belt.

NOTE: When removing the timing belt from the camshaft sprocket, make sure the belt does not slip off of the other camshaft sprocket. Support the belt so it can not slip off of the crankshaft sprocket and opposite side camshaft sprocket.

7. Remove the air intake hose.

8. Label and disconnect the spark plug wires and vacuum hoses.

9. Remove the valve cover.

10. If removing the left cylinder head, matchmark the distributor rotor to the distributor housing and the housing to distributor extension locations. Remove the distributor and the distributor extension. Also, remove the EGR pipe.

11. Remove the air intake plenum and intake manifold assembly.

12. Remove the exhaust manifold.

13. Remove the cylinder head bolts starting from the outside and working inward.

Rocker arms/shafts assembly—3.0L engine

Intake Manifold

REMOVAL & INSTALLATION

2.0L and 2.6L Engines

1. Disconnect the negative battery cable.
2. Remove the air cleaner assembly. Remove the dipstick bracket bolt from the thermostat housing.
3. Drain the cooling system. Disconnect the heater hoses from the manifold.
4. Disconnect the upper radiator hose from the thermostat housing.
5. Remove and plug the fuel lines to the carburetor.
6. Disconnect and label the vacuum lines, hoses and wiring connectors from the manifold and carburetor.
7. Disconnect all the linkages from the carburetor.
8. Remove the manifold nuts and bolts and remove the manifold from the engine.
9. The installation is the reverse of the removal procedure. Torque the intake manifold nuts and bolts to 12 ft. lbs. (17 Nm).

2.4L Engine

1. Relieve the fuel pressure.
2. Disconnect the negative battery cable.
3. Drain the engine coolant. Disconnect the upper radiator hose from the thermostat housing.
4. Remove the air intake hoses and the air intake pipe.
5. Disconnect all wires, hoses and linkages to the throttle body.
6. Remove the ignition coil.
7. Disconnect the brake booster hose and vacuum hose cluster from the air intake plenum.
8. Unbolt the air intake plenum from the intake manifold and remove the plenum from the engine.
9. Cover the fuel line with a clean shop rag and disconnect the fuel lines from the fuel rail. Keep the line covered or plugged.
10. Remove the fuel rail assembly with injectors.
11. Disconnect the heater hose from the manifold.
12. Disconnect the wires to the engine coolant switches.

13. Matchmark the rotor to the housing and remove the distributor.

14. Unbolt the intake manifold from the cylinder head and remove from the engine.

15. Thoroughly clean and dry the mating surfaces of the manifold and cylinder head.

To install:

16. Using a new gasket, install the intake manifold to the head. Starting from the middle and working outward, torque the retaining nuts to 12 ft. lbs. (16 Nm).

17. Connect the wires to the engine coolant switches. Install the distributor.

18. Install the fuel rail assembly to the manifold and connect the fuel line using a new O-ring.

19. Connect the heater hose to the manifold.

20. Install the air intake plenum with a new gasket. Torque the retaining bolts to 12 ft. lbs. (16 Nm).

21. Connect the vacuum hoses cluster, brake booster hose and all wires, hoses and linkages to the throttle body.

22. Install the ignition coil.

Air intake plenum assembly—2.4L engine

23. Install the air intake pipe and hoses.

24. Connect the upper radiator hose.

25. Fill the radiator with coolant.

26. Connect the negative battery cable and connect the jumper wire from the fuel pump activation terminal to the positive battery post to inspect the system for leaks.

27. Set all adjustments to specifications.

3.0L Engine

1. Relieve the fuel pressure.

2. Disconnect the negative battery cable.

3. Drain the engine coolant. Disconnect the upper radiator hose from the thermostat housing.

4. Remove the air intake hose from the throttle body.

5. Disconnect all wires, hoses and linkages to the throttle body.

6. Disconnect the EGR temperature sensor wire.

7. Remove the ignition coil.

8. Remove the engine oil filler neck bracket.

9. Unbolt the EGR tube from the

air intake plenum.

10. Disconnect the PCV hose and vacuum hose cluster from the plenum.

11. Remove the plenum to engine brackets.

12. Unbolt the air intake plenum assembly from the intake manifold and remove.

13. Cover the fuel lines with a clean shop rag and disconnect the fuel lines from the fuel rail. Keep the lines covered or plugged.

14. Remove the fuel rail with injectors.

15. Disconnect the upper radiator hose from the thermostat housing and disconnect the bypass hose. Disconnect the wires to the coolant temperature switches around the housing.

16. Remove the intake manifold retaining nuts and remove the manifold from the cylinder heads.

17. Remove the gaskets and thoroughly clean and dry the mating surfaces of the manifold and heads.

To install:

18. Position the manifold over the studs and install the retaining nuts. Torque them to 12 ft. lbs. (16 Nm),

starting from the center and working outward.

19. Connect the hoses and connect the wires to the coolant switches.

20. Install the fuel rail assembly and connect the fuel hoses.

21. Using a new gasket, install the air intake plenum to the intake manifold. Torque the nuts and bolts to 12 ft. lbs. (16 Nm). Install the plenum to engine brackets.

22. Connect the PCV hose and vacuum hose cluster to the plenum.

23. Connect the EGR tube.

24. Install the engine oil filler neck bracket.

25. Install the ignition coil assembly.

26. Connect the EGR temperature sensor wire.

27. Connect all wires, hoses and linkages to the throttle body.

28. Install the air intake hose to the throttle body.

29. Connect the upper radiator hose to the thermostat housing.

30. Fill the radiator with coolant.

31. Connect the negative battery cable and connect the jumper wire from the fuel pump activation terminal to

- 15. High pressure fuel hose
- 16. Injector harness connector
- 17. Fuel rail
- 18. Insulator
- 19. Heater hose
- 20. Wiring harness connector
- 21. Coolant outlet fitting
- 22. Gasket
- 23. Thermostat
- 24. Distributor
- 25. Plenum bracket
- 26. Intake manifold bracket
- 27. Intake manifold
- 28. Gasket
- 29. Thermo switch (automatic transmission only)
- 30. Coolant temperature sensor
- 31. Coolant temperature sending unit
- 32. Coolant temperature switch (automatic transmission only)

Intake manifold assembly—2.4L engine

the positive battery post to inspect the system for leaks.

32. Set all adjustments to specifications.

Exhaust Manifold

REMOVAL & INSTALLATION

2.0L, 2.4L and 2.6L Engines

1. Disconnect the negative battery cable.
2. Remove the heat cowl from the exhaust manifold.
3. Remove the aspirator valve assembly, if equipped.

4. Raise the vehicle and support safely. Disconnect the exhaust pipe from the manifold. Lower the vehicle.
5. Disconnect the oxygen sensor connector or ground cable, if equipped.
6. Remove the manifold mounting nuts and remove the manifold from the engine.
7. Remove the gasket and replace it with a new one.
8. The installation is the reverse of the removal procedure. Torque the manifold mounting nuts to 13 ft. lbs. (18 Nm) starting from the middle and working outward.
9. Start the engine and check for exhaust leaks.

3.0L Engine

1. Disconnect the negative battery cable. Raise and safely support the vehicle.
2. Disconnect the exhaust pipe from the exhaust manifolds.
3. Remove the heat shield.
4. If removing the left side manifold, remove the EGR tube.
5. If removing the right side manifold, remove the alternator bracket.
6. Remove the manifold attaching nuts and remove the manifold.
7. Remove the gasket and replace it with a new one.
8. The installation is the reverse of

1. Air intake hose
2. Throttle position sensor connector
3. Stepper motor connector
4. Accelerator cable adjusting bolt
5. Throttle control cable (automatic transmission only)
6. Accelerator cable
7. Coolant hoses
8. EGR temperature connector
9. Vacuum hose
10. Brake booster vacuum hose
11. Ignition coil wire
12. Ignition coil
13. Oil filler neck bracket
14. PCV hose
15. Vacuum hose cluster
16. EGR pipe attaching bolt
17. Gasket
18. Bracket bolt
19. Attaching bolt and nut
20. Air intake plenum and throttle body assembly
21. Gasket

Air Intake plenum assembly—3.0L engine

the removal procedure. When installing, the numbers 1-3-5 on the gaskets are used with the right side cylinders and 2-4-6 are on the gasket for the left side cylinders. Torque the manifold nuts to 14 ft. lbs. (19 Nm).

9. Start the engine and check for exhaust leaks.

Timing Chain Case Cover

REMOVAL & INSTALLATION

2.6L Engine

1. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Remove the shroud, fan, belts and radiator as required.

4. Remove the power steering pump, alternator, air conditioning compressor and accompanying brackets, as required.

5. Remove the valve cover. Matchmark the distributor gear to its drive gear and remove the distributor.

6. Remove the 2 small front bolts from the cylinder head which screw into and seal the top of the timing cover.

7. Remove the crankshaft bolt and pull off the crankshaft pulley.

8. Raise the vehicle and support safely. Remove the engine undercover. Remove the bolts that attach the front of the oil pan to the chain case cover.

NOTE: As soon as the timing cover gasket seal is broken, antifreeze will start pouring out from the water jacket extension in the cover. Place a large drainpan under the work area or the floor will get soaked with antifreeze.

9. Remove the remaining timing cover retaining bolts. Position a drainpan under the timing cover and separate the cover from the block. When the antifreeze has stopped draining, remove the cover. If the oil pan gasket was damaged during this operation, drain the oil and remove the oil pan.

To install:

10. Thoroughly clean and dry all sealing surfaces.

11. Replace the adjuster window gasket.

12. Carefully pry the crankshaft oil seal out of the cover without scratching the seal bore. Install a new seal using a suitable seal driver or installer.

13. Apply a thin coat of silicone sealer to the top of the timing chain cover to seal the head gasket extension. Install the cover to the block using new gaskets.

14. Install all cover bolts with the appropriate brackets in place. Torque the bolts to 10 ft. lbs. (13 Nm).

15. Install the crankshaft pulley. Thoroughly clean and dry the crankshaft pulley bolt and apply a very thin bead of Loctite® to the threads. Torque the bolt to 87 ft. lbs. (118 Nm).

16. Install the oil pan with a new gasket, if it was removed.

17. Thoroughly clean and dry the 2 end bolts that attach the chain cover to the head. Install them and torque to 13 ft. lbs. (18 Nm).

18. Install the distributor aligning the matchmarks.

19. Install the valve cover with a new gasket.

20. Install the power steering pump, alternator, air conditioning compressor and any remaining brackets. Install the fan and adjust the belt tensions.

21. Install the radiator and shroud, if they were removed.

22. Refill the cooling system and fill the engine with oil.

Intake manifold assembly—3.0L engine

23. Connect the negative battery cable, road test the vehicle and check for leaks.

Front Cover Oil Seal

REPLACEMENT

2.6L Engine

1. Disconnect the negative battery cable.
2. Remove the accessory drive belts.
3. Remove the crankshaft pulley.
4. Carefully pry the crankshaft oil seal out of the cover without scratching the seal bore.
5. Install a new seal using a suitable seal driver or installer.

6. Thoroughly clean and dry the crankshaft pulley bolt and apply a very thin bead of Loctite® to the threads. Torque the bolt to 87 ft. lbs. (118 Nm).

7. The installation is the reverse of the removal procedure.

Timing Chain and Gears

ADJUSTMENT

2.6L Engine

The timing chain is not manually adjustable because spring tension along with oil pressure push the tensioner out to automatically take up

slack on the chain. However, if there is noise coming from the chain case, it is possible that the silent chain is loose. To adjust the silent chain:

1. Disconnect the negative battery cable.
2. Remove the adjuster window on the chain case cover located below and to the left of the water pump.
3. Simultaneously apply pressure down on the adjuster protrusion and loosen the adjuster bolt.
4. Hold steady pressure down on the protrusion and tighten the bolt.
5. Reseal the window with silicone sealer or a new gasket and install.

Timing chain, silent shaft chain and related parts—2.6L engine

REMOVAL & INSTALLATION

2.6L Engine

1. If possible, position the engine so that the No. 1 piston is at TDC on the compression stroke. Disconnect the negative battery cable. Drain the coolant.

2. Remove the timing chain case cover.

3. Remove the 3 silent shaft chain guides. Label each bolt as it is removed. The bolts are of different lengths and styles and must be re-installed in the correct locations.

4. Remove the flange bolts from the right silent shaft and oil pump gears and carefully remove the chain with all 3 gears. Watch for the aligning keys on the oil pump shaft and right silent shaft. If the chain is removed individually, remove the gears afterward.

NOTE: The 2 gears are identical, but the oil pump drive sprocket is installed with the concave side toward the engine while the right silent shaft sprocket has the concave side out.

5. The timing chain tensioner maintains constant spring pressure on the chain. To prevent it from popping out of the oil pump it must be fastened in place. Run a piece of wire around the plunger and the left side of the oil pump. Remove the remaining chain guides.

6. Remove the camshaft gear bolt and pry the distributor drive gear from the cam gear. Remove the cam gear from the camshaft and allow it to sit on the gear holder below it. Rotate the camshaft so the spring pin is at the 12 o'clock position.

7. Unbolt the holder and remove the chain with both gears. Remove the tensioner and spring from the oil pump.

8. Inspect all gears, guides and the chains themselves for wear and replace as required.

To install:

9. Assemble the new timing chain with the gears. Both the crankshaft sprocket and the camshaft sprocket have a small dot on their faces. Assemble the chain and sprockets so that each dot aligns with the plated links on

the chain. Both sets of marks and links must align.

10. Turn the crankshaft as required so that the installed positions of the respective gears are correct.

11. Install the new tensioner and spring in the bore of the oil pump and hold it down with a piece of wire. Make sure the tensioner is equipped with the black washer on the shaft. If the washer is missing, the chain will slap.

12. Install the crankshaft gear to the crankshaft and install the cam gear holder while holding the gear up in place. Allow the cam gear to rest on the holder.

13. Lift the cam gear into place against the camshaft, install the distributor drive gear and install the bolt. Make certain the sprocket engages the guide pin correctly. Tighten the bolt to 40 ft. lbs. (55 Nm).

14. Remove the wire holding the tensioner plunger and allow it to tension the chain. Install the right side guide.

15. Assemble the silent shaft gear, the oil pump gear and the silent shaft chain. Again, each sprocket is marked with a dot which must be aligned with

Camshaft position for chain installation—2.6L engine

Timing chain installation—2.6L engine

the plated links on the chain. The sprocket for the silent shaft mounts with the concave side facing out (away from the engine block) and the sprocket for the oil pump mounts with the concave side facing the engine block.

16. Install the silent chain with gears onto the shafts. Turn the oil pump shaft and right silent shaft as required to keep the marks aligned.

17. Install the chain guides. Make sure the lock washer is installed between the tensioner guide pivot bolt and the timing chain guide under it. Torque all 10mm flanged bolts to 8 ft. lbs. (11 Nm). Adjust the upper guide so

that when the chain is pulled downward at the center, the clearance between the chain and the guide is 0.008–0.031 in. (0.20–0.80mm). Torque the tensioner guide locking bolt to 14 ft. lbs. (19 Nm).

18. Install the gear retaining bolts to the oil pump and right silent shaft. Torque the bolts to 25 ft. lbs. (34 Nm).

19. Install the timing chain case cover and all related parts.

20. Refill the cooling system and fill the engine with oil.

21. Connect the negative battery cable, road test the vehicle and check for leaks.

Timing Belt Front Cover

REMOVAL & INSTALLATION

2.0L and 2.4L Engines

1. Disconnect the negative battery cable. Remove the spark plug wires from the tree on the upper cover.

2. Drain the cooling system. Remove the shroud, fan, belts and radiator as required.

3. Remove the power steering pump, alternator, air conditioning compressor, tension pulley and accompanying brackets, as required.

4. Remove the upper front timing belt cover.

5. Remove the water pump pulley and the crankshaft pulley(s).

6. Remove the lower timing belt cover to engine screws and remove the cover.

7. The installation is the reverse of the removal procedure. Make sure the packing is positioned in the inner grooves of the covers properly when installing.

3.0L Engine

1. Disconnect the negative battery cable.

2. Drain the coolant.

3. Remove the upper radiator shroud.

4. Remove the fan, belts and fan pulley.

5. Without disconnecting the lines, remove the power steering pump from its bracket and position it to the side. Remove the pump brackets.

6. Remove the belt tensioner pulley bracket.

7. Without releasing the refrigerant remove the air conditioning compressor from its bracket and position it to the side. Remove the bracket.

8. Remove the cooling fan bracket.

9. Remove the crankshaft pulley bolt and the pulley from the crankshaft.

10. Remove the timing belt cover bolts and the upper and lower covers from the engine.

11. The installation is the reverse of the removal procedure. Make sure the packing is positioned in the inner grooves of the covers properly when installing. Torque the crankshaft pulley bolt to 110 ft. lbs. (150 Nm).

Timing Belt and Tensioner

ADJUSTMENT

2.0L and 2.4L Engines

1. Disconnect the negative battery cable.

Silent shaft chain installation—2.6L engine

2. Remove the timing belt cover.

3. Adjust the silent shaft (inner) belt first. Loosen the pulley center bolt so the pulley may be moved.

4. Move the pulley up by hand so the center span of the long side of the belt deflects about 1/4 inch.

5. Hold the pulley tightly so that the pulley itself does not rotate when the bolt is tightened. Tighten the bolt to 15 ft. lbs. (20 Nm). If the pulley has moved, the belt will be too tight.

6. Check the timing (outer) belt tension.

7. To adjust the timing (outer) belt, first loosen the tensioner pulley bolts.

8. Allow the spring to take up the slack. Check that the deflection of

the longest span (between the camshaft and oil pump sprockets) is about 1/2 inch. Do not manually overtighten the belt or it will howl.

9. Tighten the lower pulley bolts first to 35 ft. lbs. (47 Nm), then the upper bolt to the same value.

10. Install the covers and all related parts.

3.0L Engine

1. Loosen the bolt that holds the timing belt tensioner in place.

2. Allow the spring to pull the tensioner in automatically.

3. Tighten the tensioner locking bolt.

Silent shaft belt installation—2.0L and 2.4L engines

REMOVAL & INSTALLATION

2.0L and 2.4L Engines

1. If possible, crank the engine around so that the No. 1 piston is at TDC.

2. Disconnect the negative battery cable.

3. Remove the timing belt covers. If the belt(s) are to be reused, mark the direction of rotation on the belt.

4. Remove the timing (outer) belt tensioner and remove the belt. Unbolt the tensioner from the block and remove.

5. Remove the outer crankshaft sprocket and flange.

6. Remove the silent shaft (inner) belt tensioner and remove the belt. Unbolt the tensioner from the block and remove.

To install:

7. Align the timing mark of the silent shaft belt sprockets on the crankshaft and silent shaft with the marks

Timing belt installation—2.0L and 2.4L engines

Checking the left side silent shaft for proper positioning

on the front case. Wrap the silent shaft belt around the sprockets so that there is not slack in the upper span of the belt and the timing marks are still in line.

8. Install the tensioner initially so that the actual center of the pulley is above and to the left of the installation bolt.

9. Move the pulley up by hand so the center span of the long side of the belt deflects about 1/4 inch.

10. Hold the pulley tightly so that the pulley itself does not rotate when the bolt is tightened. Tighten the bolt to 15 ft. lbs. (20 Nm). If the pulley has moved, the belt will be too tight.

11. Install the timing belt tensioner fully toward the water pump and temporarily tighten the bolts. Place the upper end of the spring against the water pump body. Align the timing marks of the cam, crankshaft and oil pump sprockets with their corresponding marks on the front case or head.

NOTE: If the following step is not followed exactly, there is a chance that the silent shaft alignment will be 180 degrees off. This will cause a noticeable vibration in the engine and the entire procedure will have to be repeated.

12. Before installing the timing belt,

ensure that the left side silent shaft is in the correct position. To do so, remove the plug from the left side of the block and insert a suitable tool. With the timing marks still aligned, the tool must be able to go in at least 2 1/3 in. If it can only go in about 1 in. turn the oil pump sprocket 1 complete revolution, recheck and realign the timing marks. Leave the tool in place to hold the silent shaft while continuing.

13. Install the belt to the crankshaft sprocket, oil pump sprocket, then the camshaft sprocket, in that order. While doing so, make sure there is no slack between the sprockets except where the tensioner will take it up when released.

14. Recheck the timing marks' alignment. If all are aligned, loosen the tensioner mounting bolt and allow the tensioner to apply tension to the belt.

15. Remove the tool that is holding the silent shaft in place and turn the crankshaft clockwise a distance equal to 2 teeth of the camshaft sprocket. This will allow the tensioner to automatically tension the belt the proper amount.

NOTE: Do not manually move the tensioner any more than the spring does; this will overtighten the belt and will cause a howling noise.

16. Tighten the lower mounting bolt, then tighten the upper spacer bolt.

17. To verify that belt tension is correct, check that the deflection of the longest span (between the camshaft and oil pump sprockets) is about 1/2 inch.

18. Install the timing belt covers and all related parts.

19. Connect the negative battery cable and road test the vehicle.

3.0L Engine

1. If possible, position the engine so that the No. 1 cylinder is at TDC. Disconnect the negative battery cable. Remove the timing covers from the engine.

2. If the same timing belt will be reused, mark the direction of the timing belt's rotation, for installation in the same direction. Make sure the engine is positioned so the No. 1 cylinder is at the TDC of its compression stroke and the sprockets timing marks are aligned with the engine's timing mark indicators.

3. Loosen the timing belt tensioner bolt and remove the belt. If not removing the tensioner, position it as far away from the center of the engine as possible and tighten the bolt.

4. If the tensioner is being removed, paint the outside of the spring to ensure that it is not installed backwards.

Timing belt installation—3.0L engine

Unbolt the tensioner and remove it along with the spring.

To install:

5. Install the tensioner, if removed and hook the upper end of the spring to the water pump pin and the lower end to the tensioner in exactly the same position as originally installed. If not already done, position both camshafts so the marks line up with those on the alternator bracket (rear bank) and inner timing cover (front bank). Rotate the crankshaft so the timing mark aligns with the mark on the oil pump.

6. Install the timing belt on the crankshaft sprocket and while keeping the belt tight on the tension side (right side), install the belt on the front camshaft sprocket.

7. Install the belt on the water pump pulley, then the rear camshaft sprocket and the tensioner.

8. Rotate the front camshaft counterclockwise to tension the belt between the front camshaft and the crankshaft. If the timing marks came out of line, repeat the procedure.

9. Install the crankshaft sprocket flange.

10. Loosen the tensioner bolt and allow the spring to tension the belt.

11. Turn the crankshaft 2 full turns in the clockwise direction only until the timing marks align again. Now that the belt is properly tensioned, torque the tensioner lock bolt to 21 ft. lbs. (29 Nm).

12. Install the timing belt covers and all related parts.

13. Connect the negative battery cable and road test the vehicle.

Timing Sprockets

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the timing belt(s).

3. To remove the camshaft sprocket, hold the sprocket with a suitable holding tool and remove the retaining bolt and washer.

4. To remove the crankshaft sprocket, remove the bolt, if equipped and remove the sprocket from the crankshaft.

5. To remove a silent shafts sprocket, remove the retaining bolt and pry the sprocket from its mounting shaft.

6. The installation is the reverse of the removal procedure.

Camshaft

REMOVAL & INSTALLATION

2.0L and 2.4L Engines

1. Disconnect the negative battery

cable. Remove the valve cover and the upper timing belt cover.

2. Matchmark the rotor to the distributor housing and remove the distributor.

3. Secure the belt to the sprocket and hold the sprocket up with a fabricated device to keep the belt taut. If timing is lost, it will have to be reset. Remove the camshaft sprocket from the camshaft.

4. Remove the camshaft cap bolts evenly and gradually.

5. Remove the caps, shafts, rocker arms and bolts together as an assembly.

6. Remove the camshaft with the front seal from the engine.

To install:

7. Install a new roll pin to the camshaft. Lubricate the camshaft and install with the front seal in place. Install the camshaft in position so the hole in the sprocket will line up with the roll pin.

8. Install the caps, shafts and arms assembly. Tighten the camshaft bearing cap bolts in the following order to 85 inch lbs. (10 Nm): No. 3, No. 2, No. 4, front cap, rear cap. Repeat the sequence increasing the torque to 175 inch lbs. (19 Nm).

9. Install the sprocket to the camshaft, engaging the roll pin. Torque the bolt to 70 ft. lbs. (95 Nm). Install the distributor.

10. Install the valve cover and all related parts.

2.6L Engine

1. Disconnect the negative battery cable.

2. Remove the valve cover.

3. Remove the camshaft gear retaining bolt and matchmark the distributor gear to its drive gear.

4. Remove the distributor. Pry the distributor drive gear off of the cam gear.

5. Remove the cam gear from the camshaft and allow it to rest on the holder below it.

6. Remove the camshaft cap bolts evenly and gradually.

7. Remove the caps, shafts, rocker arms and bolts together as an assembly.

8. Remove the camshaft with the rear seal from the engine.

To install:

9. Install a new roll pin to the camshaft. Lubricate the camshaft and install with the rear seal in place. Install the camshaft in position so the hole in the gear will line up with the roll pin.

10. Install the rocker caps, shafts and arms assembly. Tighten the camshaft bearing cap bolts in the following order to 85 inch lbs. (10 Nm): No. 3,

No. 2, No. 4, front cap, rear cap. Repeat the sequence increasing the torque to 175 inch lbs. (19 Nm).

11. Install the gear to the camshaft engaging the roll pin. Install the distributor drive gear and install the bolt and washer. Torque the bolt to 40 ft. lbs. (54 Nm). Install the distributor.

12. Install the valve cover and all related parts.

3.0L Engine

1. Disconnect the negative battery cable. Remove the valve cover.

2. Remove the timing belt and remove the sprocket from the camshaft.

3. Install auto lash adjuster retainers MD998443 or equivalent on the rocker arms.

4. If removing the left side camshaft, remove the distributor and the distributor extension.

5. Remove the camshaft bearing caps but do not remove the bolts from the caps. Remove the rocker arms, rocker shafts and bearing caps, as an assembly.

6. Remove the camshaft from the cylinder head.

7. Inspect the bearing journals on the camshaft, cylinder head and bearing caps.

To Install:

8. Lubricate the camshaft journals and camshaft with clean engine oil and install the camshaft in the cylinder head.

9. Align the camshaft bearing caps with the arrow mark (depending on cylinder numbers) and in numerical order.

10. Apply sealer at the ends of the bearing caps and install the assembly.

11. Torque the bearing cap bolts, in the following sequence: No. 3, No. 2, No. 1 and No. 4 to 85 inch lbs. (10 Nm).

12. Repeat the sequence increasing the torque to 175 inch lbs. (18 Nm).

13. Install the distributor, if it was removed.

14. Install the sprocket, timing belt and all related parts.

15. Install the valve cover.

Silent Shafts

REMOVAL & INSTALLATION

2.0L and 2.4L Engines

1. Disconnect the negative battery cable.

2. Remove the timing belts.

3. Remove the timing belt sprockets.

4. Remove the front case.

5. Remove the oil pump components.

6. Remove the shafts from the block.

7. The installation is the reverse of the removal procedure.

2.6L Engine

1. Disconnect the negative battery cable.

2. Matchmark the silent chain to the gears and remove the chain.

3. Remove the oil pump. The right side silent shaft will come out with the pump. To remove the shaft from the pump, remove the retaining bolt from the pump and remove the shaft from the pump.

4. Remove the left silent shaft gear and spacer. Remove the thrust plate retaining screws and remove the thrust plate by installing two $\frac{1}{32}$ in. screws into the threaded holes and pulling the plate out.

5. Remove the silent shaft.

6. Install a new O-ring to the thrust plate.

7. The installation is the reverse of the removal procedure. Torque the silent shaft retaining bolts to 25 ft. lbs. (34 Nm).

8. Connect the negative battery cable and road test the vehicle.

Piston positioning—3.0L engine

Piston and Connecting Rod

POSITIONING

Piston positioning—2.6L engine

ENGINE LUBRICATION

Oil Pan

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Raise the vehicle and support safely.

3. Remove the skid plate(s), engine undercover, air guide plate, cross shaft plate as required.

4. Remove the front exhaust pipe, if necessary.

5. Remove steering linkage components as required.

6. On some vehicles, unbolt the motor mounts and raise the engine safely using the proper equipment.

6. Drain the engine oil from the pan.

7. Disconnect the fluid level sensor

wire, if equipped. Remove the attaching bolts and remove the pan.

8. The installation is the reverse of the removal procedure.

Oil Pump

REMOVAL & INSTALLATION

2.0L and 2.4L Engines

1. Disconnect the negative battery cable. Remove the timing belt covers, timing belts and sprockets with the right side silent shaft sprocket spacer.

2. Raise the vehicle and support safely. Drain the oil and remove the oil filter. Remove the oil pan and gasket. Remove the oil pump pickup and gasket.

3. Remove the oil pressure relief plunger plug and gasket. Remove the spring and plunger from the oil filter bracket.

4. Remove the 4 bracket mounting bolts and remove the oil filter mount and gasket.

5. Using special tool MD998162, re-

Engine lubrication components—2.0L and 2.4L engines

move the cap and gasket that cover the oil pump driven gear shaft. This is located on the right side of the front case at the front of the engine, just above the protruding drive gear shaft.

6. Using a long socket, remove the retaining bolt from the oil pump driven gear located behind the plug removed earlier.

7. Remove the front case mounting bolts and remove the case from the block.

8. Completely remove the case gasket from the block.

To install:

9. Prime the pump by pouring fresh oil into the pump intake and turning the driveshaft until oil comes out the pressure port. Repeat a few times until no air bubbles are present. Replace all seals on the case assembly.

10. Install a special seal guide to the crankshaft, MD998285 or equivalent so the smaller diameter faces outward. Coat the outer diameter of the seal with clean engine oil.

11. Install a new front case gasket and install the front case by carefully positioning the crankshaft seal over

the seal guide and lining up all bolt holes. Install and tighten the bolts to 17 ft. lbs. (23 Nm).

12. Remove the plug from the left side of the block. Hold the left side silent shaft by inserting a suitable tool in the plug hole and torque the driven gear bolt to 26 ft. lbs. (35 Nm). Using a new O-ring, install the plug cover.

13. Install the oil filter mounting bracket gasket. Install the mounting bracket and bolts; torque the oil filter mounting bracket bolts to 12 ft. lbs. (16 Nm).

14. Clean or replace the oil pickup screen. Install with a new gasket.

15. Install the oil pan using a new gasket.

16. Install the timing sprockets, belts and covers.

17. Fill the engine with the proper amount of engine oil.

18. Connect the negative battery cable and check for proper oil pressure and leaks.

2.6L Engine

1. Disconnect the negative battery cable. Remove the dipstick.

2. Raise the vehicle and support safely. Drain the engine coolant and oil. Remove the oil pan and timing chain cover. Rotate the engine until all 3 silent chain gear marks are in a position to matchmark them to the corresponding chain link. Using different color paint, matchmark the chain to the gears. Remove the silent shaft chain. The lower guide bolts are also oil pump mounting bolts.

3. Remove the oil pump mounting bolts and remove the pump with the timing chain tensioner and the right side silent shaft.

4. Remove the silent shaft and its key from the oil pump.

To install:

5. Remove the gasket material from the block.

6. Prime the pump by pouring fresh oil into the pump intake and turning the driveshaft until oil comes out the pressure port. Repeat a few times until no air bubbles are present.

7. Install the silent shaft key to the oil pump and install the silent shaft itself to the pump.

8. Install the timing chain tensioner and spring to its bore in the pump.

Engine lubrication components—2.6L engine

Make sure the rubber washer is installed on the tensioner and is not damaged. If it is, the timing chain will make noise.

9. Install the new gasket to the pump and install the pump to the block engaging the tensioner with the timing chain. Make sure the dowels are seated in their bores. Torque the mounting bolts to 13 ft. lbs. (18 Nm).

10. Install the silent shaft chain aligning the matchmarks.

11. Remove the oil pickup and clean or replace, as required. Reinstall with a new gasket.

12. Install the timing chain cover, oil pan and all related parts.

13. Install the dipstick. Fill the engine with the proper amount of oil.

14. Connect the negative battery cable and check the oil pressure.

3.0L Engine

1. Disconnect the negative battery cable. Remove the dipstick.

2. Raise the vehicle and support safely. Remove the timing belt, drain the engine oil and remove the oil pan from the engine. Remove the oil pickup.

3. Remove the oil pump mounting bolts and remove the pump from the front of the engine. Note the different length bolts and their position in the pump for installation.

To install:

4. Clean the gasket mounting surfaces of the pump and engine block.

5. Prime the pump by pouring fresh oil into the pump and turning the rotors or, using petroleum jelly, pack the inside of the oil pump. Using a new gasket, install the oil pump on the engine and torque all bolts to 11 ft. lbs. (15 Nm).

6. Install the balancer and crankshaft sprocket to the end of the crankshaft.

7. Clean out the oil pickup or replace as required. Replace the oil pickup gasket ring and install the pickup to the pump.

8. Install the timing belt, oil pan and all related parts.

9. Install the dipstick. Fill the engine with the proper amount of oil.

10. Connect the negative battery cable and check the oil pressure.

Aligning the oil pump gear timing marks—2.0L and 2.4L engines

Aligning the oil pump gear timing marks—2.6L engine

Engine lubrication components – 3.0L engine

CHECKING

2.0L and 2.4L Engines

1. Remove the oil pump cover from the front case.
2. Check the case and gear cover for stepped wear from the gears.
3. Measure the drive gear tip clearance between the teeth and the case. The specification is 0.006–0.010 in. (0.16–0.25mm).
4. Check the driven gear tip clearance in the similar manner. The specification is 0.005–0.010 in. (0.13–0.25mm).
5. Place a straightedge across the gears resting on the opposite sides of the case. If a 0.010 in. (0.25mm) feeler gauge can be inserted under the straightedge, replace the assembly.
6. Check the relief plunger for freedom of movement and check the spring for deformation and rust.
7. If the gears were removed from the body, install them with the mating marks aligned. If they are not aligned

properly, the silent shaft will be out of time.

8. Install the gear cover to the case using a new gasket. Torque the bolts to 12 ft. lbs. (16 Nm).

2.6L Engine

1. Remove the cover from the oil pump.
2. Measure the clearance between the gears and their bearings. The specification for both is 0.0008–0.0020 in. (0.02–0.05mm).
3. Check the clearance between the gears and the housing. The specification for both gears is 0.004–0.006 in. (0.11–0.15mm).
4. Check endplay of the gears using a feeler gauge and a straight edge placed across the pump body. The specification for both is 0.002–0.004 in. (0.04–0.11mm).
5. Check the pressure relief valve for damage. The spring's frelength specification is 1.85 in. (47.00mm).
6. If the gears were removed from the body, install them with the mating

aligned. If they are not aligned properly, the silent shaft will be out of time.

7. Torque the cover screws to 13 ft. lbs. (18 Nm).

3.0L Engine

1. Remove the rear cover.
2. Remove the pump rotors and inspect the case for excessive wear.
3. Measure the diameter of the inner rotor hub that sits in the case. Measure the inside diameter of the inner rotor hub bore. Subtract the first measurement from the second; if the result is over 0.006 in. (0.15mm), replace the oil pump assembly.
4. Measure the clearance between the outer rotor and the case. The specification is 0.004–0.007 in. (0.10–0.18mm).
5. Check the side clearance of the rotors using a feeler gauge and a straightedge placed across the case. The specification is 0.0015–0.0035 in. (0.04–0.09mm).
6. Check the relief plunger and spring for damage and breakage.
7. Install the rear cover to the case.

Rear Main Bearing Oil Seal

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the transmission. Remove the flywheel or flexplate and transmission mounting plate, if equipped.

3. If there is any leakage coming from the rear seal retainer, drain the engine oil and remove the oil pan, if necessary. Remove the rear main oil seal retainer.

4. Remove the separator from the retainer, if equipped. Remove the seal from the retainer.

To install:

5. Install the separator with the hole at the 6 o'clock position. Lightly coat the seal outer diameter with Loctite® Stud N' Bearing Mount, or equivalent.

6. Install the seal to the retainer.

7. If the retainer was removed, thoroughly clean and dry the retainer to block sealing surfaces and install a new gasket or apply silicone sealer and install the retainer. Install the pan, if it was removed.

8. Install the flywheel or flexplate and the transmission.

9. Connect the negative battery cable and check for leaks.

6. Matchmark and remove the driveshaft(s) from the vehicle. Install a suitable plug in the transfer case adaptor to prevent leakage.

7. Disconnect the speedometer cable from the transmission or transfer case. Remove the slave cylinder or disconnect the clutch cable.

8. Disconnect the reverse lamp switch.

9. Remove the starter and the bell housing cover.

10. Support the weight of the engine using a jack stand with a block of wood to protect the oil pan.

11. Using the proper equipment, support the weight of the transmission safely.

12. Remove the transfer case bracket, if equipped and remove the crossmember.

13. Remove the bellhousing bolts remove the transmission assembly from the vehicle.

To install:

14. Lubricate the pilot bushing and input shaft splines very lightly with high temperature lubricant.

15. Mount the transmission securely on a suitable transmission jack and lift it in place until the input shaft is centered in the clutch housing opening. Roll the transmission forward until the input shaft splines fully engage with the clutch disc.

16. Install the transmission to clutch housing bolts. Torque the bolts to 35 ft. lbs. (47 Nm).

17. Jack the assembly up into position and install the transmission crossmember and transfer case bracket, if equipped. Torque the frame bolts to 50 ft. lbs. (68 Nm). Remove the transmission and engine support fixtures.

18. Install the starter and torque the mounting bolt to 20 ft. lbs. (27 Nm). Install the bellhousing cover.

20. Connect the reverse light switch and clip all wiring to the transmission case.

21. Connect the speedometer cable.

22. Install the driveshaft(s).

23. Install the slave cylinder or connect the clutch cable, using a new cotter pin.

24. Fill the transmission and transfer case with the proper amount of SAE 80W or 75W/85W hypoid gear oil with an API classification of GL-4 or higher.

25. Install the skip plate, if equipped. Lower the vehicle.

26. Install the shift lever assembly, boot and console.

27. Connect the negative battery cable and check the transmission and transfer case for proper operation. Make sure the reverse lights come on when in the reverse gear.

LINKAGE ADJUSTMENT

Since this transmission uses a directly engaging shift mechanism, there are no provisions for adjustment.

CLUTCH

Clutch Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Raise the vehicle and support safely.

3. Remove the transmission and transfer case, if equipped.

4. Remove the clutch cover and disc from the flywheel. Sand, machine or replace the flywheel as required.

To install:

5. Apply a very light coating of anti-seize compound to the input shaft and clutch disc splines. Install a new release bearing.

6. Raise the clutch cover and disc into place and use a suitable clutch aligning tool or spare input shaft to center the disc. Apply Loctite® to the threads and tighten all of the bolts finger tight.

7. The cover bolts must be turned gradually, evenly and to the proper torque to avoid distorting the cover. Torque the bolts to 15 ft. lbs. (20 Nm).

8. Install the transmission and transfer case, if equipped.

9. Connect the negative battery cable and check the clutch for proper operation.

Clutch Cable

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Turn the cable adjusting wheel counterclockwise to provide enough play to remove the cable end from the clutch lever inside the vehicle. Remove the cable from the lever.

3. Raise the vehicle and support safely.

4. Remove the cotter pin from the lever on the transmission.

5. Remove the clutch cable from the vehicle.

6. The installation is the reverse of the removal procedure. Make sure the insulator is positioning properly.

MANUAL TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transmission Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Place the shifter(s) in the neutral position.

3. Remove the console, if equipped. Remove the boot retainer screws and remove the boot.

4. Remove the shift lever assembly out of the control housing. Cover the opening with a clean towel to prevent dirt from entering the transmission.

5. Raise the vehicle and support safely. Remove the skid plate, if equipped. Drain the transmission and transfer case, if equipped.

PEDAL HEIGHT/FREE-PLAY ADJUSTMENT

1. Measure the distance from the face of the pedal pad to the floorboard. This distance should be about 6½–7 in.
2. If the pedal height is not correct, adjust the pedal stopper to contact the pedal at the correct spot.
3. Check the pedal's free-play. The specification is about 1 in.
4. Adjust the clutch cable by turning the star shaped adjusting wheel on the firewall. Turning the wheel counterclockwise will increase the amount of free-play in the pedal and vice-versa.

Clutch Master Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove as much fluid as possible from the clutch master cylinder reservoir.
2. Remove the cotter pin and remove the clevis pin from the clutch pedal.
3. Disconnect and plug the fluid line from the clutch master cylinder.
4. Remove the mounting nuts and remove the cylinder from the firewall.
5. Remove the reservoir from the cylinder.
5. The installation is the reverse of the removal procedure.
6. Bleed the system.

Clutch Slave Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Raise the vehicle and support safely.
3. Remove the eye-bolt and washer from the slave cylinder.
4. Remove the mounting bolts and remove the slave cylinder from the transmission case.
5. Replace the eye-bolt washer.
6. The installation is the reverse of the removal procedure.
7. Bleed the system.

BLEEDING THE HYDRAULIC CLUTCH SYSTEM

CAUTION

When bleeding, keep the facial area well away from the slave cylinder area. Spewing fluid may cause facial and/or visual damage.

1. Fill the clutch master cylinder with fresh DOT3 brake fluid.

2. Have a helper sit in the vehicle. Raise the vehicle and support safely.
3. Remove the bleeder screw cap.
4. If the system is empty, the most efficient way to get fluid down to the cylinder is to loosen the bleeder about ½–¾ turn, place a finger firmly over the bleeder and have the helper pump the brakes slowly until fluid pressure is felt at the bleeder. Once fluid is at the bleeder, close it before the pedal is released.

NOTE: If the pedal is pump rapidly, the fluid will churn and create small air bubbles, which are difficult and time consuming to remove from the system. These air bubble will eventually congregate and will result in a spongy pedal.

5. Once fluid has been pumped to the slave cylinder, open the bleeder screw, have the helper depress the clutch pedal, lock the bleeder and have the helper release the pedal. Wait 15 seconds and repeat the procedure (including the 15 second wait) until no air bubbles emanate from the bleeder. Remember to close the bleeder each time before the pedal is released. If the bleeder is left open when the pedal is released, air will be induced into the system.
6. If a helper is not available, connect a small hose to the bleeder, submerge the other end in a clean container of fresh brake fluid placed in a position that is visible from the driver's seat and pump the pedal until no more air comes out of the tube.

AUTOMATIC TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transmission Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the transfer shifter boot, if equipped.
3. Raise the vehicle and support safely.
4. Remove the skid plate, if equipped. Drain the transmission and transfer case, if equipped.
5. Matchmark and remove the driveshaft(s).

6. Disconnect the speedometer cable from the transmission or transfer case.
7. Disconnect the shifter linkage or cable.
8. Unplug all transmission electrical connectors.
9. Unbolt the exhaust pipe from the manifold and remove the bracket from the case.
10. Remove the filler neck and dipstick.
11. Remove the torque converter inspection plate. Remove the torque converter bolts.
12. Remove the starter.
13. Disconnect and plug the oil cooler lines.
14. Using a suitable transmission jack, support the transmission and unbolt the transmission from the crossmember.
15. Remove the crossmember on all vehicles except Van, because the transmission hangs from the mount on that vehicle.
16. Lower the transmission down slightly and unbolt the transfer shifter from the transfer case, if equipped.
17. Remove the bellhousing bolts and brackets.
18. Pull the transmission assembly backwards to clear the dowels and remove it from the vehicle.

To install:

19. Install the transmission assembly to the engine using the dowels as guides. Install the bellhousing bolts and torque to 35 ft. lbs. (47 Nm).
20. Install the transfer shifter, if equipped. Jack the assembly up into position and install the rear crossmember or mounting hardware. Torque the crossmember to frame bolts to 50 ft. lbs. (68 Nm). Torque the through bolt and nut on Van to 60 ft. lbs. (81 Nm).
21. Apply Loctite® to the threads and install the torque converter bolts. Torque the bolts to 25 ft. lbs. (34 Nm). Install the inspection plate.
22. Install the filler tube with a new O-ring and the dipstick.
23. Install the exhaust pipe to the manifold and install the brackets.
24. Connect all previously disconnected switches.
25. Connect the shifter linkage or cable and the throttle cable.
26. Install the driveshaft(s). Fill the transfer case with hypoid gear oil with an API classification of GL-4 or higher.
27. Connect the throttle cable.
28. Install the skid plate, if equipped. Lower the vehicle.
29. Install the transfer shifter boot, if equipped.
30. Fill the transmission with the proper amount of Dexron®II.

Throttle cable adjustment—fuel injected engine

Neutral safety switch adjustment

31. Connect the negative battery cable, start the engine and run through the gears. Add fluid until the transmission is properly filled.

32. Check the operation of the neutral safety switch and make sure the reverse lights come on in the **R** detent.

33. Road test the vehicle and check for leaks.

SHIFT LINKAGE ADJUSTMENT

1. On the Van, remove the floor console. Position the shifter in the **N** detent.

2. Loosen the nut or bolt on the shifter linkage or cable.

3. Make sure the lever on the transmission is in the **N** detent and the needle in the indicator is also in the **N** position. Jiggle the selector rod to settle the assembly in position. If the rod is equipped with a notch, it should be at the 6 o'clock position.

4. Tighten the adjusting bolt or nut and check for proper assembly.

5. Check the operation of the neutral safety switch.

6. Liberally lubricate all pivoting points within the system.

THROTTLE CABLE ADJUSTMENT

1. Depress the accelerator fully and

make sure the throttle valve opens all the way. Adjust as required.

2. Measure the distance between the end of the rubber boot and the stopper on the cable at wide open throttle.

3. The specification for carbureted engines is 2.05–2.09 in. (52–52mm) and for fuel injected engines is 0–0.04 in. (0–1mm).

4. Adjust the cable on carbureted engines by moving the bracket. Adjust the cable itself on fuel injected engines.

5. Road test the vehicle and check for proper shift points.

NEUTRAL SAFETY SWITCH ADJUSTMENT

NOTE: Some vehicles are not equipped with an adjustable switch.

1. Adjust the shifter linkage.

2. Raise the vehicle and support safely. Place the shifter in the **N** detent. Loosen the mounting bolts.

3. Align the lever with the positioning boss.

4. Hold in position and tighten the bolts.

5. Check the switch and the reverse lights for proper operation.

Throttle cable adjustment—carbureted engine

TRANSFER CASE

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transfer Case Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the transmission and transfer case assembly from the vehicle.

3. Remove the roll pin that retains the shift changer to the control shaft.

4. Remove the selector plunger from the right side of the case.

5. Remove the selector spring and plunger or steel ball.

6. Remove the transfer case to transmission attaching nuts and remove from the transmission.

7. The installation is the reverse of the removal procedure.

LINKAGE ADJUSTMENT

Since this transfer case uses a directly engaging shift mechanism, there are no provisions for adjustment.

1. Oil filler plug
2. Drain plug
3. Plug
4. Gasket
5. Selector spring
6. Selector plunger
7. Roll pin
8. Wire clamp
9. Wire clamp
10. Shift changer
11. Transfer case assembly
12. Gasket
13. Plug
14. Spring
15. Steel ball
16. Plug
17. Neutral return spring
18. Plunger
19. Plunger

Typical transfer case assembly

1. Inner shaft
2. Bearing
3. Dust cover
4. Housing tube
5. Dust seal

Inner axle shaft and tube

DRIVE AXLE

Driveshaft and U-Joints

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely. Remove the skid plate, if equipped.
2. Matchmark the driveshaft and the drive pinion gear shaft yoke.

3. Remove the nuts and bolts attaching the driveshaft to the yoke. Pry the shaft from the yoke.

3. Remove the center bearing mounting nuts and bolts.

4. Fluid may run from the rear of the extension housing or transfer case when the shaft is removed, so position a suitable drain pan under the area.

5. Remove the driveshaft from the transmission or transfer case.

6. The installation is the reverse of the removal procedure. Torque the driveshaft to yoke nuts to 40 ft. lbs. (54 Nm). Torque the center bearing retaining nuts to 30 ft. lbs. (41 Nm).

Front Axle Shaft

REMOVAL & INSTALLATION

Before beginning, place the free-wheeling hub in the free condition by placing the transfer lever in the **2H** position and moving in reverse for about 6 or 7 feet.

1. Raise the vehicle and support safely. Remove the tire and wheel assembly.

2. Remove the front brake caliper assembly and position it to the side.

3. Remove the free wheeling hub

Front axle shafts and related parts

cover assembly and remove the snapping from the axle shaft.

4. Remove the snapping and shim. Remove the knuckle and front hub together as a unit.

5. If removing the left side shaft, simply pull the shaft out of the differential carrier assembly. When pulling the left shaft from the differential carrier assembly, be careful that the shaft splines do not damage the oil seal.

6. On 1986 Pick-Up or Ram 50 only, raise the right lower suspension arm and remove the right shock absorber if removing the right side shaft.

7. Disconnect the right shaft from the inner shaft assembly and remove the shaft. Remove the inner shaft from the housing tube and the housing tube from the differential housing.

8. Press the bearing and seal off of the inner shaft and remove the dust seal from the tube.

To install:

9. Using tool MB990955, install a new dust seal to the tube and coat the lip with grease.

10. Using a suitable long steel pipe, install a new dust cover to the inner

shaft and coat the inside with grease. Press the bearing onto the shaft using tool MD990560 and a press.

11. Install a new circlip on the splines of the left side shaft or inner right shaft.

12. Drive the shafts into the differential carrier assembly with a plastic hammer. Be careful not to damage the lip of the oil seal.

13. Install the right outer shaft to the inner shaft and torque the nuts to 40 ft. lbs. (54 Nm). Install the right shock absorber, if it was removed.

14. Install the knuckle and front hub assembly.

15. Install the shim and snapping and check for proper endplay. Set a dial indicator so the pin is resting on the end of the axle shaft. The endplay specification is 0.008–0.020 in. (0.2–0.5mm). If not within specifications, adjust by adding or removing shims.

16. Install the hub cover.

17. Install the front brake caliper assembly

18. Install the tire and wheel assembly.

19. Road test the vehicle.

Rear Axle Shaft, Bearing and Seal

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. Remove the rear tire and wheel assembly and brake drum.

3. Disconnect and plug the brake line(s) at the wheel cylinder. Disconnect the parking brake cable from the shoes and remove the cable from the backing plate.

4. Remove the 4 nuts behind the brake backing plate holding the bearing case to the axle housing assembly.

5. Remove the backing plate, bearing case and the axle shaft as an assembly. If this is not possible by hand, use a slide hammer to remove the assembly.

6. Remove the O-ring and the bearing preload shims. Save the preload shims for reassembly.

7. Remove the oil seal from the axle tube with a hooked slide hammer.

8. To remove the axle shaft bearing,

1. Brake drum
2. Parking brake cable attaching bolt
3. Parking brake cable
4. Brake fluid lines
5. Nut
6. Rear axle shaft assembly
7. Shim
8. O-ring
9. Locknut
10. Lock washer
11. Washer
12. Axle shaft
13. Outer race
14. Seal
15. Bearing
16. Seal

Rear axle shaft assembly

remove the notched locknut with tool MB990785-01 or a brass drift.

9. Remove the lock washer and flat washer.

10. Screw the locknut back on to the axle shaft about 3 turns.

11. If tool MB990787-01 is not available, it will be necessary to fabricate a metal plate that fits over the axle shaft and butts the locknut. Drill 4 holes in the plate that align with the 4 bearing case studs and fit the plate. Refit 2 nuts and washers to the bearing case studs diagonally across from each other and tighten them evenly to free the bearing case and the bearing.

12. Use a hammer and drift to remove the bearing outer race from the bearing case.

13. Remove the outer oil seal from the bearing case.

To install:

14. Apply grease to the outer surface on the bearing outer race and to the lip of the outer oil seal and drive them into the bearing case from each side.

15. Slide the bearing case and bearing over the rear axle shaft. Apply grease on the bearing rollers and fit the inner race by pressing it into place. Be careful not to damage or deform the dust cover.

16. Pack the bearing with grease.

17. Install the washer, the crowned lock washer and the locknut in that order and torque the locknut to 130-159 ft. lbs. (176-220 Nm)

18. Bend the tab on the lock washer into the groove on the locknut. If the tab and the groove do not line up, slightly tighten the locknut until they do.

19. Drive the new inner oil seal into place after greasing it and refit the assembly. Install a new O-ring, install the shims and apply silicone rubber sealant to the face of the bearing case.

20. Install the entire assembly to the axle housing. Torque the retaining nuts to 40 ft. lbs. (54 Nm).

21. Check the axle shaft endplay. If it is not between 0.002-0.008 in. (0.05-0.20mm), proceed with the axle shaft endplay adjustment procedure.

22. If the endplay is within specifications, install all removed brake parts and bleed the system.

23. Install the tire and wheel assembly and road test the vehicle. Check for leaks.

Measuring axle shaft endplay

ENDPLAY ADJUSTMENT PROCEDURE

1. Begin with the left side rear axle assembly and insert a 0.04 in. (1mm) shim between the bearing case and the axle shaft housing. Torque the nuts to specification.

2. Install the right side axle assembly into the right side housing without its shim and O-ring. Torque the 4 nuts to about 50 inch. lbs.

3. Using a feeler gauge, measure the gap between the bearing case and the axle housing face.

4. Remove the axle shaft and select a shim or shims that is the equal to the sum of the clearance measured in Step 3 plus 0.002–0.008 in. (0.05–0.20mm) and install them on the housing. Install the O-ring and apply sealant.

5. Install the axle assembly and torque the nuts to 40 ft. lbs. (54 Nm).

6. Measure the endplay and complete the installation procedure.

Front Wheel Hub, Knuckle and Bearings

REMOVAL & INSTALLATION

2WD Vehicle

1. Raise the vehicle and support safely. Remove the tire and wheel assembly.

2. Remove the brake caliper, pads and adaptor and position them out of the way.

3. Remove the grease cap.

4. Remove the cotter pin, castellated nut and washer. Remove the outer bearing.

5. Remove the front hub/rotor assembly from the steering knuckle. Remove the grease seal and inner bearing from the hub. Remove the splash shield.

6. Remove the nuts and bolts that attach the hub to the rotor and separate them. Clean out all of the old grease from the inside of the hub.

7. Remove the shock and stabilizer bar from the lower control arm, if equipped.

8. Support the lower control arm. Compress the coil spring with the special spring compressor, if equipped. Separate the ball joints and tie rod end from the knuckle.

9. Remove the steering knuckle.

To install:

10. Install the knuckle to the ball joint studs. Torque all ball joint nuts except the upper nut on Pick-Up and Ram 50 to 100 ft. lbs. (136 Nm). Torque the aforementioned nut to 60 ft. lbs. (82 Nm). Install new cotter pins. Remove the spring compressor, if it was used. Install the shock.

11. Connect the stabilizer bar to the lower control arm. Tighten the nut until the bushing is the same diameter as the washer.

12. Connect the tie rod end to the knuckle. Torque the nut to 30 ft. lbs. (41 Nm). Install a new cotter pin.

13. Assemble the rotor and front hub. Torque the nuts to 40 ft. lbs. (54 Nm).

14. Apply wheel bearing grease to the inside of the front hub.

15. Pack the inner bearing and install to the hub.

16. Install a new oil seal into the hub so it is flush with the hub end face.

17. Install the assembly onto the steering knuckle, pack and install the outer bearing.

18. Install the washer and castellated nut. Spin the rotor and torque the nut to 22 ft. lbs. (30 Nm), loosen completely and retighten to 6 ft. lbs. (8 Nm) while turning the wheel.

19. Install a new cotter pin and install the grease cap.

20. Install the brake hardware and bleed the system if it was opened.

21. Install the tire and wheel assembly and road test the vehicle.

Automatic Hub, Front Axle Hub, Knuckle and Bearings

REMOVAL & INSTALLATION

1. Before beginning, place the free-wheeling hub in the free condition by placing the transfer lever in the 2H position and moving in reverse for about 6 or 7 feet. Raise the vehicle and support safely. Remove the tire and wheel assembly.

2. Remove the front brake caliper, pads and adaptor and position them out of the way.

3. Remove the hub cover.

4. Remove the snapping and shim.

5. Remove the automatic free-wheeling hub retaining bolts and remove the hub.

6. Remove the lock washer. Remove the locknut with special tool MB990954 or equivalent.

7. Remove the front hub and brake rotor assembly, with the inner and

1. Hub cover
2. Snapping
3. Shim
4. Caliper
5. Bolts
6. Automatic free-wheeling hub assembly
7. Lock washer
8. Locknut
9. Front hub and rotor

Front hub and automatic hub assembly—4WD vehicles

1. Oil seal
2. Spacer
3. Needle bearing
4. Knuckle

Steering knuckle, needle bearing, spacer and seal—4WD vehicle

Aligning the key in the automatic hub with the keyway in the spindle

outer bearings.

8. Remove the outer bearing, oil seal, inner bearing and races.

9. Remove the nuts and bolts that hold the front hub and brake rotor together and separate them.

10. Support the lower control arm with a jack. Separate the ball joints and tie rod end from the knuckle. Once the ball joints have been released, lower the control arm slowly.

11. Remove the steering knuckle.

12. Remove the oil seal and spacer. If damaged, drive out the needle bearing from the spindle end of the knuckle.

To install:

13. Use either Mitsubishi tool MB990985 or Chrysler tool C-4178 to press the new needle bearing into the knuckle. Lubricate the rollers and install the spacer with the chamfered side facing the center of the vehicle. Install a new seal until it is flush with the knuckle end face and lubricate the lip.

14. Install the knuckle to the ball joint studs. Torque all ball joint nuts except the upper nut on Pick-Up and Ram 50 to 100 ft. lbs. (136 Nm). Torque the aforementioned nut to 60 ft. lbs. (82 Nm). Install new cotter pins.

15. Connect the tie rod end to the

knuckle. Torque the nut to 30 ft. lbs. (41 Nm). Install a new cotter pin.

16. Clean out all of the old grease from inside the front hub.

17. Bolt the rotor and front hub together. Torque the nuts to 40 ft. lbs. (54 Nm). Install new races and apply wheel bearing grease to the inside of the front hub.

18. Pack the inner bearing and install to the race.

19. Install a new oil seal into the front hub so it is flush with the front hub end face.

20. Install the assembly onto the steering knuckle, pack and install the outer bearing. Using special tool MB990954 or equivalent, which fits standard torque wrenches, torque the locknut to 95-145 ft. lbs. (130-200 Nm). Loosen the locknut completely, then retorque to 18 ft. lbs. (25 Nm). To complete the procedure, position the torque wrench at the 3 o'clock position and loosen the nut the equivalent of 1 hour (30 degrees).

21. Install the lock washer. If the lock washer and locknut holes do not align, align the holes by loosening the nut slightly.

22. Before installing the automatic hub assembly, measure the turning force of the front hub. If the measured

value does not meet specifications (2.5-11.5 inch lbs.), retorque the locknut. Also check the hub for an endplay of no more than 0.002 in. (0.05mm).

23. Apply a very thin even coating of sealant to the free wheeling hub surface of the front hub. Carefully align the key of the free-wheeling hub brake with the keyway of the knuckle spindle and install the automatic hub assembly. The mounting surfaces of the automatic hub and the front hub must be perfectly flush before the mounting bolts are torqued.

24. Torque the automatic hub mounting bolts to 40 ft. lbs. (54 Nm).

25. Check the front hub turning resistance again. If the difference between the reading in Step 16 and this reading is more than 8.7 inch lbs., repair or replace the automatic hub, as required.

26. Install the shim and snapping. Rotate the axle shaft forward and backward and stop at a position midway between 2 heavy spots where there is a heavy feeling.

27. Set a dial indicator so the pin is resting on the end of the axle shaft. The endplay specification is 0.008-0.020 in. (0.2-0.5mm). If not within specifications, adjust by adding or removing shims.

28. Install the hub cover.

29. Install the brake hardware and install the wheel and tire assembly.

30. Road test the vehicle.

Pinion Seal

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. Matchmark and remove the driveshaft.

3. Check the turning torque of the pinion before proceeding. It should be 3.5-4.5 inch lbs. (0.4-0.5 Nm). This is the torque that must be reached during installation of the pinion nut.

4. Using a suitable pinion flange holding tool, remove the pinion nut and washer.

5. Remove the companion flange from the drive pinion.

6. Pry the pinion seal out of the differential carrier.

7. Clean and inspect the sealing surface of the housing.

To install:

8. Using a seal driver, drive the new seal into the housing until the flange on the seal is flush with the carrier.

9. With the seal installed, the pinion bearing preload must be set.

10. Tighten the pinion nut, while holding the flange, until the turning torque is the same as before removal of the nut. The final pinion nut torque

Differential carrier removal and installation

Front axle removal and installation

must be 137-181 ft. lbs. (190-250 Nm).

11. Align the matchmarks and install the drive shaft.

12. Check the level of the differential lubricant when finished.

Differential Case

REMOVAL & INSTALLATION

Front Differential

1. Raise the vehicle and support safely. Remove the under cover.

2. Remove all 3 front axle shafts.

3. Drain the front differential and remove the cover.

4. Remove the bearing cap retaining bolts, matchmark and remove the caps.

5. Carefully pry the differential case out of the housing, being careful not to drop the outer races.

6. Label any loose parts as they are removed from the assembly.

To install:

7. Install the differential case to the housing.

8. Install the caps aligning the matchmarks made previously. Torque the retaining bolts evenly and gradually to 45 ft. lbs. (61 Nm).

9. Thoroughly clean the sealing surfaces of the cover and the differential housing. Reseal the cover and install to the housing.

10. Install the axle shafts.

11. Level the vehicle and fill the differential with Hypoid gear oil with an API classification of at least GL-5, until it spills out the fill hole.

12. Install the under cover and lower the vehicle.

13. Perform a road test and check the differential for leaks.

Front Differential Housing

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. Remove the under cover and drain the differential.

3. Remove the hubs, knuckles and axle shafts as complete assemblies.

4. Remove the inner shaft.

5. Matchmark and remove the front driveshaft.

6. Support the differential housing with a jack.

7. Remove the differential mounting brackets.

8. Remove the front suspension crossmember.

9. Lower the differential housing and remove it from the vehicle.

To install:

10. Mount the housing safely on a suitable jack and raise into position.

11. Lubricate the bushings and install the crossmember and housing brackets.

12. Torque all crossmember mounting nuts and bolt to 80 ft. lbs. (109 Nm) and the housing bracket mounting bolts to 65 ft. lbs. (88 Nm).

13. Replace the circlips and install the inner axle and axle, knuckle and hub assemblies.

14. Install the front driveshaft.

15. Level the vehicle and fill the differential with Hypoid gear oil with an API classification of at least GL-5, until it spills out the fill hole.

16. Install the under cover and lower the vehicle.

17. Perform a road test and check the differential for leaks.

8. Place a suitable jack under the center of the differential housing and unbolt the shocks from their lower mounts.

9. Remove the U-bolts, shackle assemblies and remove the leaf springs.

10. Lower the axle and remove it from the vehicle.

To install:

11. Raise the axle assembly into position and install the leaf springs. Make sure the shackle nuts are on the inside of the shackles.

12. Install the lower shock mounting bolts.

13. Install the driveshaft.

14. Install the breather hose, if equipped.

15. Connect the brake hose.

16. Connect the parking brake cables and install the retaining bolts.

17. Install the load sensing spring support and spring, if equipped.

18. Level the vehicle and fill the differential with Hypoid gear oil with an API classification of at least GL-5, until it spills out the fill hole.

NOTE: If the vehicle is equipped with a limited slip differential, add the proper amount of limited slip friction modifier additive before filling the differential with gear oil.

19. Bleed the rear brakes. Install the drums and tire and wheel assemblies.

20. Lower the vehicle so that the full weight of the vehicle is on the ground. Unload any excess weight that is weighing down the rear of the vehicle. Adjust the load sensing proportioning valve lever so that the distance from the proportioning valve lever to the spring support is about 7 in.

21. Road test the vehicle and check for leaks.

Differential Carrier

REMOVAL & INSTALLATION

Rear Differential

1. Raise the vehicle and support safely.

2. Drain the rear differential.

3. Remove the rear tire and wheel assemblies and brake drums.

4. Remove the axle shafts.

5. Matchmark and remove the driveshaft.

6. Remove the differential carrier retaining nuts and remove the carrier from the axle housing.

7. The installation is the reverse of the removal procedure. Torque the carrier retaining nuts to 22 ft. lbs. (27 Nm).

Rear Axle Housing

REMOVAL & INSTALLATION

Except Montero and Raider with Coil Springs

1. Raise the vehicle and support safely. Drain the differential.

2. Remove the tire and wheel assemblies. Remove the brake drums.

3. Remove the parking brake cable attaching bolts, disconnect the cables from the shoes and unclip them from the backing plates.

4. Disconnect the brake hose at the T-fitting.

5. Remove the load sensing proportioning valve spring support, if equipped.

6. Disconnect the breather hose, if equipped.

7. Matchmark and remove the driveshaft.

Montero and Raider with Coil Springs

1. Raise the vehicle and support safely. Drain the differential.

2. Remove the tire and wheel assemblies. Remove the brake drums.

3. Remove the parking brake cable attaching bolts, disconnect the cables from the shoes and unclip them from the backing plates.

4. Disconnect the brake hose at the T-fitting.

5. Disconnect the breather hose.

7. Matchmark and remove the driveshaft.

8. Remove the rear stabilizer bar attaching bolts, links and bushings.

9. Place a suitable jack under the center of the differential housing and remove the rear trailing arm, if equipped.

Rear axle assembly—Montero and Raider with coil springs

10. Remove the lateral rod.
11. Unbolt the shocks from their lower mounts.

12. Lower the axle housing enough to remove the coil springs and the stabilizer bar.

13. Lower the axle assembly and remove it from the vehicle.

To install:

14. With the coil springs and stabilizer bar in place, raise the axle assembly into place and install the lower shock mounting bolts.

15. Install the lateral rod but do not tighten the nuts yet.

16. Assemble the trailing arm with its front mounting spacers, bushings and nuts. Make sure the washer's concave side faces away from the bushings. Install the trailing arm and torque the rear mount nuts to 90 ft. lbs. (122 Nm). Do not tighten the front mounting nuts yet.

17. Install the stabilizer bar and tighten the mounting nuts until the diameter of the bushing is the same as the diameter of the washers.

18. Install the driveshaft and breather hose.

19. Connect the parking brake cables and install the retaining bolts.

20. Level the vehicle and fill the differential with Hypoid gear oil with an API classification of at least GL-5, until it spills out the fill hole.

NOTE: If the vehicle is equipped with a limited slip differential, add the proper amount of limited slip friction modifier additive before filling the differential with gear oil.

21. Bleed the rear brakes. Install the drums and tire and wheel assemblies.

20. Lower the vehicle so that the full weight of the vehicle is on the ground. Torque the lateral rod mounting nuts to 90 ft. lbs. (122 Nm) and the front trailing arm mounting nuts to 100 ft. lbs. (150 Nm).

21. Road test the vehicle and check for leaks.

STEERING

Steering Wheel

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the center pad.

3. Remove the steering wheel hold-down nut. Matchmark the steering wheel to the shaft.

4. Using a suitable steering wheel puller, pull the steering wheel off of the shaft.

5. The installation is the reverse of the removal procedure.

Manual Rack and Pinion Steering Gear

REMOVAL & INSTALLATION

Van

1. Disconnect the negative battery cable.

2. Raise the vehicle and support safely. Remove the under cover.
3. Remove the front tire and wheel assemblies.
4. Remove the cotter pins, castellated nuts and tie rod ends from the steering knuckles.
5. Disconnect the intermediate shaft from the steering gear yoke.
6. Remove the gear housing clamps and remove the gear from the vehicle. Transfer the mounting insulators to the new gear.
7. The installation is the reverse of the removal procedure. Torque the steering gear mounting bolt to 60 ft. lbs. (81 Nm).
8. Align the front end.

ADJUSTMENT

With the rack removed from the vehicle, total pinion torque can be checked and adjusted. Remove the boots before attempting to adjust because they will create an additional drag.

1. Attach special tool MB990228-01 to the pinion shaft and rotate the pinion with an inch lb. torque wrench. Turn the pinion 180 degrees to the right and left to measure.
2. The specification is 5-10 inch lbs.
3. If not within specifications, loos-

en the large locknut below the shaft and tighten the adjust cover until the proper turning torque is reached.

4. If the proper torque is not obtained after tightening the adjust cover 60 degrees, disassemble the unit and replace worn parts.

Manual Steering Gear REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise the vehicle and support safely.
2. Remove the pinch bolt that holds the steering column shaft to the steering gear main shaft.
3. Remove the cotter pin, castellated nut and remove the steering linkage from the pitman arm.
4. Remove the steering gear mounting nuts and remove the gear from the vehicle.
5. Matchmark and remove the pitman arm from the pitman shaft.
6. The installation is the reverse of the removal procedure. Torque the pitman arm nut to 100 ft. lbs. (136 Nm) and the gear's mounting nuts to 35 ft. lbs. (47 Nm).
7. Align the front end.

ADJUSTMENT

1. With the gear removed from the vehicle and the pitman arm installed, move the pitman arm back and forth 5 times to mesh the gears sufficiently.
2. Measure the steering gear backlash by setting up a dial indicator with the pin resting on the side of the end of the pitman arm. Make sure the backlash with all internal gears in the straight ahead position.
3. The backlash should be no more than 0.02 in. (0.5mm). Adjust the adjusting screw to obtain the proper backlash.

Power Rack and Pinion Steering Gear

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Raise the vehicle and support safely. Remove the under cover.
3. Remove the front tire and wheel assemblies.
4. Remove the cotter pins, castellated nuts and tie rod ends from the steering knuckles.
5. Disconnect the intermediate shaft from the steering gear yoke.

Power steering components—Van

6. Disconnect and plug the fluid lines from the fittings on the rack.

7. Remove the gear housing clamps and remove the gear from the vehicle. Transfer the mounting insulators to the new gear and replace the O-rings on the the fluid lines.

8. The installation is the reverse of the removal procedure. Torque the steering gear mounting bolt to 60 ft. lbs. (81 Nm).

9. Fill and bleed the system.

10. Align the front end as required.

ADJUSTMENT

With the rack removed from the vehicle, total pinion torque can be checked and adjusted. Remove the boots before attempting to adjust because they will create an additional drag.

1. Attach special tool MB990228-01 to the pinion shaft and rotate the pinion with an inch lb. torque wrench. Turn the pinion 180 degrees to the right and left to measure.

2. The specification is 6-12 inch lbs.

3. If not within specifications, loosen the large locknut below the shaft and tighten the adjust cover until the proper turning torque is reached.

4. If the proper torque is not obtained after tightening the adjust cover 60 degrees, disassemble the unit and replace worn parts.

1. Pinch bolt
2. Pressure hose
3. Return hose
4. Cotter pin
5. Castellated nut
6. Steering linkage
7. Locknuts
8. Steering shaft
9. Power steering gear

Power steering gear and related parts - Montero, Raider, Pick-Up and Ram 50

Power Steering Gear

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise the vehicle and support safely.

2. Fold back the dust boot which covers the steering shaft joint, if equipped. Remove the pinch bolt that holds the steering column shaft to the steering gear main shaft.

3. Remove the cotter pin, castellated nut and remove the steering linkage from the pitman arm.

4. Disconnect and plug the fluid lines from the steering gear.

4. Remove the steering gear mounting nuts and remove the gear from the vehicle.

5. Matchmark and remove the pitman arm from the pitman shaft.

6. The installation is the reverse of the removal procedure. Torque the pitman arm nut to 100 ft. lbs. (136 Nm) and the gear's mounting nuts to 28 ft. lbs. (38 Nm) on 2WD vehicles and 45 ft. lbs. (61 Nm) on 4WD vehicles.

7. Fill and bleed the system.

8. Align the front end.

ADJUSTMENT

1. Attach special tool MB990228-01 to the mainshaft and rotate the pinion with an inch lb. torque wrench to measure the starting torque.

2. The specification is 4-11 inch lbs.

3. If not within specifications, loosen the adjusting screw locknut and adjust the locknut until the proper starting torque is reached.

4. Tighten the adjusting bolt locknut.

Bevel Gear and Intermediate Shaft

REMOVAL & INSTALLATION

Van

1. Disconnect the negative battery cable. Raise the vehicle and support safely.

2. Remove the pinch bolt that holds the steering column shaft to the bevel gear input shaft.

3. Remove the pinch bolt and remove the intermediate shaft from the bevel gear output shaft.

4. Remove the mounting bolts and remove the bevel gear from the vehicle.

5. Disconnect the intermediate shaft from the steering gear yoke and remove the shaft. Inspect the rubber coupling for damage.

6. The installation is the reverse of the removal procedure. Torque the bevel gear mounting bolt to 35 ft. lbs. (47 Nm).

Power Steering Pump

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Position a drain pan under the power steering pump.

3. Disconnect the fluid lines from the pump and plug them.

4. Remove the front bracket attaching bolts and remove the belt from the pulley.

5. Remove the pump from the vehicle.

6. The installation is the reverse of the removal procedure.

7. Adjust the belt tension.

8. Fill and bleed the system.

BELT ADJUSTMENT

Except 3.0L Engine

1. Loosen the pump mounting bolts.
2. Using a suitable pry bar, move the pump away from the engine.
3. With the pump moved enough so that the belt deflects about $\frac{1}{4}$ – $\frac{1}{2}$ in. under a 10 lb. load, tighten the bolts.

3.0L Engine

1. Loosen the tensioner pulley locknut.
2. Tighten the adjuster bolt until the belt deflects about $\frac{1}{4}$ – $\frac{1}{2}$ in. under a 10 lb. load
3. Tighten the tensioner lock bolt.

SYSTEM BLEEDING

Except Van

1. Fill the reservoir with Dexron®II.
2. Raise the front end of the vehicle.
3. Disconnect the ignition coil wire.
4. Simultaneously crank the engine and turn the steering wheel from lock to lock. Repeat this several times.

NOTE: If the bleeding procedure is done with the engine running, high speed rotation of the pump will churn the fluid and create air bubbles filling the system with air. Bleed the system while cranking the engine only.

5. Lower the front end.
6. Connect one end of a suitable vinyl tube to the breather plug on the steering box and place the other a container.
7. Start the engine and allow it to idle.
8. Loosen the breather plug and turn the steering wheel from lock to lock continuously until no more air bubbles appear in the fluid coming out the tube.

NOTE: Do not hold the steering wheel all the way against the stop for more than 5 seconds.

9. After the bleeding is done, tighten the breather plug and refill the reservoir.

Van

1. Fill the reservoir with Dexron®II. Disconnect the ignition coil wire.
2. Simultaneously crank the engine and turn the steering wheel from lock to lock. Repeat this several times.

NOTE: If the bleeding procedure is done with the engine running, high speed rotation of the pump will churn the fluid and create air bubbles filling the system

with air. Bleed the system while cranking the engine only.

3. Start the engine and allow it to idle.
4. Turn the steering wheel from lock to lock until no more bubbles are visible in the fluid reservoir.
5. Confirm that the fluid is not milky and that there is very little change in the fluid level when the steering wheel is turned.
6. If the fluid level rises when the engine is turned off, there is still air present in the system.

Tie Rod Ends

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.
2. Remove the cotter pin and nut from the tie rod end.
3. Using a suitable puller, remove the tie rod from the steering knuckle or center link.
4. Loosen the sleeve clamp nut, if equipped and unscrew the tie rod end from the sleeve or inner tie rod.
5. The installation is the reverse of the removal procedure. Torque the stud nuts to 33 ft. lbs. (45 Nm) and install a new cotter pin.
6. Lubricate the front end.
7. Perform a front end alignment as required.

BRAKES

For all brake system repair and service procedure not detailed below, please refer to "Brakes" in the Unit Repair section.

Master Cylinder

REMOVAL & INSTALLATION

Except Van

1. Disconnect the negative battery cable. Disconnect the fluid level sensor connector.
 2. Disconnect and plug the brake lines from the master cylinder.
 3. Remove the nuts attaching the master cylinder to the power booster.
 4. Remove the master cylinder from the mounting studs.
 5. Remove the fluid reservoir from the cylinder.
- To install:**
6. Bench bleed the master cylinder.
 7. Install to the studs and install the nuts.

8. Install the brake lines to the master cylinder.
9. Connect the fluid level sensor connector.
10. Bleed the brakes, if necessary.

Van

1. Disconnect the negative battery cable.
 2. Remove the instrument cluster.
 3. Disconnect and plug the fluid hoses that run from the reservoir to the actual cylinder. Make sure fluid is not leaking past the plugs.
 4. Disconnect and plug the brake lines from the master cylinder.
 5. Remove the nuts attaching the master cylinder to the power booster.
 6. Remove the master cylinder from the mounting studs.
- To install:**
7. Bench bleed the master cylinder.
 8. Install to the studs and install the nuts.
 9. Install the brake lines to the master cylinder.
 10. Connect the fluid hoses to the cylinder.
 11. Install the instrument cluster.
 12. Bleed the brakes, if necessary.
 13. Check the operation of all brake warning indicators on the instrument cluster.

Proportioning Valve

REMOVAL & INSTALLATION

Montero and Raider

1. Disconnect the negative battery cable.
2. Raise the vehicle and support safely.
3. Identify and disconnect the brake lines from the valve.
4. Disconnect the wires to the valve, if any.
5. Remove the proportioning valve from the vehicle.
6. The installation is the reverse of the removal procedure.
7. Bleed the brakes in the following order:

- a. Right rear
- b. Right front
- c. Left front

Load Sensing

Proportioning Valve

REMOVAL & INSTALLATION

Pick-Up, Ram 50 and Van

1. Disconnect the negative battery cable.
2. Raise the vehicle and support safely.

Adjusting the load sensing proportioning valve

Brake pedal assembly with booster attached—Van

3. Identify and disconnect the brake lines from the valve.

4. Remove the mounting bolts and remove the valve leaving the spring hanging from the lever.

To install:

5. Install the valve to the vehicle engaging the spring.

6. Connect the brake lines.

7. Bleed the brakes in the following order:

- a. Right rear
- b. Load sensing proportioning valve
- c. Right front
- d. Left front

7. Lower the vehicle so that the full weight of the vehicle is on the ground. Unload any excess weight that is weighing down the rear of the vehicle. Adjust the load sensing proportioning valve lever so that the distance from

the proportioning valve lever to the spring support is about 7 in.

Power Brake Booster

REMOVAL & INSTALLATION

Except Van

1. Disconnect the negative battery cable. Disconnect the vacuum hose from the booster.

2. Remove the nuts attaching the master cylinder to the booster and move the master cylinder to the side.

3. From inside of the vehicle, remove the clevis pin that secures the booster pushrod to the brake pedal.

4. Remove the nuts that attach the booster to the dash panel and remove it from the vehicle.

5. The installation is the reverse of the removal procedure.

Van

1. Disconnect the negative battery cable.

2. Remove the driver's lap heater duct.

3. Remove the upper and lower column covers.

4. Disconnect the column electrical connectors.

5. Raise the vehicle and support safely. Remove the pinch bolt that retains the column shaft to the bevel gear input shaft. Lower the vehicle.

6. Remove the master cylinder.

7. Disconnect the stop lamp switch connector.

8. Disconnect the vacuum hose from the booster.

9. Remove the entire brake pedal assembly (with its bracket) with the booster attached.

10. Remove the clevis pin that secures the booster pushrod to the brake pedal.

11. Remove the nuts that attach the booster to the brake pedal bracket.

To install:

12. Install the booster to the bracket and attach the pushrod to the brake pedal. Install the clevis pin and install a new cotter pin.

13. Install the assembly to the vehicle. Connect the vacuum hose.

14. Install the master cylinder and connect the stop lamp switch.

15. Install the column and install the pinch bolt.

16. Install the upper and lower covers and the lap duct.

17. Bleed the brakes.

Brake Caliper

REMOVAL & INSTALLATION

1986-87 Montero and Raider and 1986 Pick-Up and Ram 50

1. Raise the vehicle and support safely.

2. Remove the tire and wheel assembly. Disconnect the brake line from the brake hose.

3. Remove the cotter pins from the upper slider pad and knock the pad out. Remove the pad support plate.

4. Repeat the above for the lower slider pad and plate.

NOTE: There is no need to remove the anti-rattle springs to complete this operation.

5. Remove the caliper from the adaptor.

6. Disconnect the brake line from the caliper.

1. Brake hose
2. Clip
3. Cotter pins
4. Slider pad
5. Pad support
6. Caliper
7. Brake tube
8. Boot ring
9. Piston boot
10. Piston

11. Piston seal
12. Adaptor and pads
13. Brake pad
14. Anti-squeal plate
15. Outer pad clip
16. Inner pad clip
17. Anti-rattle clips
18. Anti-rattle springs
19. Adaptor

Front brakes — 1986-87 Montero and Raider and 1986 Pick-Up and Ram 50

To install:

7. Install the brake line to the caliper.

8. Thoroughly clean, dry and lubricate the slider pads with a very thin application of anti-seize compound.

9. Make sure all anti-rattle and squeal clips and pads are in place.

10. Install the caliper to the adaptor and install the pad plates and pads. Make sure they are installed the correct way. Compare to the other side to confirm. Install the cotter pins.

11. Connect the brake line to the hose.

12. Bleed the brakes.

13. Install the tire and wheel assembly.

14. Road test the vehicle.

Except 1986-87 Montero and Raider and 1986 Pick-Up and Ram 50

1. Raise the vehicle and support safely.

2. Remove the tire and wheel assembly. Disconnect the brake line from the caliper.

3. Label and remove the 2 mounting bolts.

4. Lift the caliper off of the adaptor.

5. The installation is the reverse of the removal procedure. Make sure all anti-rattle and -squeal clips and pads are in place. Torque the guide pin bolt to 35 ft. lbs. (47 Nm) and the lock pin bolt to 30 ft. lbs. (41 Nm).

6. Bleed the brakes and road test the vehicle.

4. Remove the pads from the adaptor.

To install:

5. Use a large C-clamp to compress the piston back into the caliper bore.

6. Install the pads to the adaptor with all anti-rattle and -squeal clips and pads in place.

8. Install the caliper.

9. Refill the master cylinder.

10. Bleed the brakes if the brake lines were opened.

Brake Rotor

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. Remove the tire and wheel assembly.

3. Remove the caliper and brake pads.

4. Remove the caliper adaptor.

5. If the vehicle is equipped with

Disc Brake Pads

REMOVAL & INSTALLATION

1. Remove some of the fluid from the master cylinder.

2. Raise the vehicle and support safely. Remove the tire and wheel assemblies.

3. Remove the caliper.

Front brakes—except 1986–87 Montero and Raider and 1986 Pick-Up and Ram 50

Rear brake shoes and hardware

4WD, remove the automatic hub, the shim, lock washer and locknut.

6. If the vehicle is 2WD, remove the dust cap, cotter pin, nut lock, nut, washer and outer bearing.

7. Remove the front hub and rotor assembly and unbolt the rotor from the hub.

To install:

8. Install the rotor to the hub and torque the attaching nuts and bolts to 40 ft. lbs. (54 Nm).

9. Install the assembly and retaining parts to the spindle.

10. Install the caliper adaptor. Torque the bolts to 70 ft. lbs. (95 Nm).

11. Install the brake pads and caliper, making sure all anti-rattle and -squeal clips and pads in place.

12. Bleed the brakes if the brake lines were opened.

13. Install the tire and wheel assembly and road test the vehicle.

Brake Drums

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. Remove the tire and wheel assembly.

3. Remove the drum retaining screw with an impact driver if equipped.

4. Remove the drum. If it is difficult to remove the drum, back off the adjusting wheel.

5. The installation is the reverse of the removal procedure.

Brake Shoes

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. Remove the tire and wheel assemblies and the brake drums.

3. Remove the upper return spring along with the adjuster.

4. Remove the lower retaining spring.

5. Remove the hold-down springs.

6. Remove the shoes, disengaging the parking brake lever.

To install:

7. Thoroughly clean and dry the backing plate. To prepare the backing plate, lubricate the bosses, anchor contacts and wheel cylinder piston grooves where the top of the shoe fits lightly with lithium based grease.

8. Remove, clean and dry all parts still on the old shoes. Lubricate the star wheel shaft threads with anti-sieze lubricant and transfer all parts to their proper locations on the new shoes. Make sure the longer end of the

upper return spring is installed toward the shoe with the parking brake lever.

9. Spread the shoes apart, engage the parking brake lever and position them on the backing plate so the wheel cylinder pins engage and the anchor pins hold the shoes.

10. Install the lower retaining spring and the hold-down springs.

11. Adjust the star wheel.

12. Remove any grease from the linings and install the drum.

13. Complete the brake adjustment with the wheels installed.

Wheel Cylinder REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. Remove the wheel, drum and brake shoes.

3. Remove the brake line from the wheel cylinder.

4. Remove the wheel cylinder bolts and remove the cylinder from the backing plate.

To install:

5. Install the cylinder to the backing plate and install the retaining bolts. Torque the bolts to 14 ft. lbs. (19 Nm).

6. Connect the brake line to the wheel cylinder.

7. Install all brake parts that were removed.

8. Install the tire and wheel assembly.

9. Bleed the brakes.

Front Parking Brake Cable REMOVAL & INSTALLATION

1. Raise the vehicle and support safely, except Van. Remove the front cable adjusting nut. This can be done inside the vehicle, at the rear of the parking brake lever on the Van.

2. Remove the brake lever cover, if floor mounted.

3. Remove the pin securing the cable to the equalizer and slide the cable out of the bracket.

4. Remove the pin or retainer attaching the cable to the handle assembly. Disengage the cable from the handle.

5. Remove the cable grommet from the floor pan and remove the cable.

6. The installation is the reverse of the removal procedure.

Rear Parking Brake Cable REMOVAL & INSTALLATION

1. Release the parking brakes fully.

2. Raise the vehicle and support safely.

3. Remove the adjusting nut from the front cable.

4. Remove the brake drums. Remove the shoes, if necessary. Disconnect the cable from the lever and compress the cable retainer tabs to remove the cable from the backing plate.

5. Remove the cable from the equalizer and remove the retaining bolts from the frame.

6. The installation is the reverse of the removal procedure.

ADJUSTMENT

1. Release the parking brakes fully.

2. Raise the vehicle and support safely.

3. Adjust the rear brakes.

4. Loosen the adjusting nut until there is slack in all the cables.

5. Rotate the rear wheels and tighten the cable adjusting nut until there is a slight drag at the wheels.

6. Continue to rotate the rear wheels and loosen the nut until all drag is eliminated.

7. Back off the nut an additional 2 turns.

8. Apply and release the parking brake several times. Upon the least release, verify that there is no drag at the wheels. The pedal should be able to be pulled 4-7 notches.

9. To check the operation, make sure the parking brake holds on an incline.

FRONT SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

1. Support the vehicle safely and raise enough so there is room to get to the upper shock mount.

2. Remove the upper shock nut, washer and bushing. Raise the vehicle fully and support safely.

3. Remove the lower mounting bolt(s) and remove the shock from the vehicle.

4. The installation is the reverse of the removal procedure.

Coil Spring

REMOVAL & INSTALLATION

2WD Pick-Up and Ram 50

1. Raise the vehicle and support safely.

Aligning the front of the torsion bar with the front anchor—Except Van

Measure this distance when installing the torsion bar to the rear anchor—Except Van

Measure this distance to initially set the riding height—Except Van

2. Remove the shock absorber.
3. Disconnect the stabilizer bar from the lower control arm.
4. Install spring compressor tool MB990792, or equivalent to the coil spring and to compress the spring.
5. Remove the cotter pin and lower ball joint nut.
6. Release the lower ball joint taper using ball stud loosening Chrysler tool C-3564-A or Mitsubishi tool MB990809-01.

7. Remove the tool and remove the ball stud from the control arm. Release the compressor tool from the coil spring.

8. Pull the arm down and remove the spring with the rubber isolation pad from the vehicle.

To install:

9. Install the spring with the rubber isolator. Install the compressor tool and compress it enough so the lower ball joint can be inserted through the knuckle.

10. Torque the lower ball joint nut to 100 ft. lbs. (136 Nm). Install a new cotter pin. Remove the spring compressor.

11. Connect the sway bar to the lower control arm, if equipped.
12. Install the shock absorber.

Torsion Bar

REMOVAL & INSTALLATION

4WD Vehicle

1. Raise the vehicle and support safely. Remove the under cover.
2. Support the lower control arm at a point away from where the torsion bar attaches to the arm.
3. Fold the dust covers back and slide them away from the ends of the bar.
4. If the bars are to be reused, matchmark the torsion bar at both ends to the anchor and identify left from right.
5. Paint or measure the distance of the exposed threads of the rear mounting bolt down to the nut to aid in adjustment when installing. Remove the rear anchor arm mounting nut and bolt.

6. Remove the torsion bar from the front anchor arm.

To install:

7. If the bar is being reused, lubricate the ends and install the torsion bar aligning the matchmarks. If a new bar is being used, align the white stripe on the front splines with the mark on the anchor. There is a mark on the front of the torsion bar to differentiate between left and right. Do not install the bar with the mark facing the rear.

8. Install the torsion bar to the rear anchor so that the length of the mounting bolt from the nut to the head of the bolt is the specified length with the rebound bumper in contact with the crossmember. Reposition the bar as required to meet the specifications. The specifications are:

Montero and Raider (left side)—5.3–5.6 in.

Montero and Raider (right side)—4.9–5.2 in.

Pick-Up and Ram 50 (left side)—5.5–5.8 in.

Pick-Up and Ram 50 (right side)—5.3–5.6 in.

9. To initially set the riding height, tighten the rear anchor mounting nut to the same point at which it was removed if the old bar is being reused. If a new bar has been installed, tighten the nut so that the exposed length of the bolt threads is the specification:

Montero and Raider (left side)—2.4 in.

Montero and Raider (right side)—2.8 in.

1986 Pick-Up and Ram 50 (left side)—3.0 in.

1986 Pick-Up and Ram 50 (right side)—2.7 in.

1987–90 Pick-Up and Ram 50 (left side)—3.9 in.

1987–90 Pick-Up and Ram 50 (right side)—3.4 in.

10. Fill the dust covers with grease and fold them back into position.

11. Adjust the torsion to the correct riding height.

Van

1. Raise the vehicle and support safely. Remove the under cover.

2. Support the lower control arm at a point away from where the torsion bar attaches to the arm.

3. Fold the dust covers back and slide them away from the ends of the bar.

4. If the bars are to be reused, matchmark the torsion bar at both ends to the anchor and identify left from right.

5. Paint or measure the distance of the exposed threads of the rear mounting bolt up to the nut to aid in adjustment.

Measure this distance when installing the torsion bar to the anchor—Van

Measure this distance to initially set the riding height—Van

Measure this distance to set the riding height—Except Van

Measure this distance to set the riding height—Van

ment when installing. Remove the rear anchor arm mounting nut and bolt.

6. Remove the torsion bar from the front anchor arm.

To install:

7. If the bar is being reused, lubricate the ends and install the torsion bar aligning the matchmarks. If a new bar is being used, align the white stripe on the front splines with the mark on the anchor. There is a mark on the rear of the torsion bar to differentiate between left and right. Do not install the bar with the mark facing the front.

8. Install the torsion bar to the rear anchor so that the length of the mounting bolt from the nut to the head of the bolt is 1.4 in. for Van or 1.0 in. for Panel Van. Reposition the bar as required to meet the specifications.

9. To initially set the riding height, tighten the rear anchor mounting nut to the same point at which it was removed if the old bar is being reused. If a new bar has been installed, tighten the nut so that the exposed length of the bolt threads is 2.5 in.

10. Fill the dust covers with grease and fold them back into position.

11. Adjust the torsion bar to the correct riding height.

Adjusting the Torsion Bar (Setting the Riding Height)

1. Lower the vehicle so that its full weight is on the ground. If there is any excess weight in the vehicle, unload it.

2. To set the riding height, measure the distance from the rebound bumper to its stopper bracket on the frame. Adjust the torsion bar nut until that distance is the specification:

Montero and Raider—2.8 in.

1986 Pick-Up and Ram 50—2.8 in.

1987-90 Pick-Up and Ram 50—3.1 in.

Van—2.0 in.

3. If, after adjusting the riding height, the exposed portion of the adjusting bolt is protruding up or down so far that it interferes with any front suspension component or is hanging down too low, the bar must be removed and repositioned.

4. Road test the vehicle and remeasure the riding height. Readjust if necessary.

Upper Ball Joint

INSPECTION

With the control arm removed, check the starting torque required to turn the ball stud. The specification for all vehicles is 7-30 inch lbs.

1. Shock absorber mounting nuts
2. Shock absorber
3. Cotter pin
4. Castellated nut
5. Rebound bumper
6. Alignment shims
7. Upper control arm

Front suspension components—2WD Pick-Up and Ram 50

REMOVAL & INSTALLATION

Except Van

NOTE: The upper ball joint and upper control arm must be replaced as an assembly on 1987-90 Pick-Up and Ram 50.

1. Raise the vehicle and support safely. Remove the upper control arm.
2. Remove the ring and boot from the ball joint. Remove the snapring.
3. Remove the ball joint from the control arm using tool sets MB990800 and MB990799.

To install:

3. Align the mating mark on the up-

per ball joint with the mark on the arm.

4. Press the ball joint in using the same tools that were used to remove the ball joint.
5. Install the snapring. If the snapring is loose, install a new one.
6. Fill the boot with grease and install the boot and ring.
7. Install the upper control arm.
8. Lubricate the ball joint with a grease gun.
9. Adjust the riding height, if equipped with a torsion bar and align the front end.

Van

1. Raise the vehicle and support safely. Remove the upper control arm.
2. Remove the ball joint retaining bolts and remove the ball joint from the arm.
3. The installation is the reverse of the removal procedure. Torque the ball joint retaining bolts to 40 ft. lbs. (54 Nm) and the ball stud nut to 100 ft. lbs. (136 Nm). Install a new cotter pin.
4. Lubricate the ball joint with a grease gun.
5. Adjust the riding height, if

equipped with a torsion bar and align the front end.

the ball stud. The specification is 9-30 inch lbs.

REMOVAL & INSTALLATION

NOTE: The lower ball joint and lower control arm must be replaced as an assembly on the Van.

1. Raise the vehicle and support safely. Remove the lower control arm.
2. Remove the ball joint retaining nuts and bolts and remove the ball joint from the arm.

3. The installation is the reverse of the removal procedure. Torque the ball joint retaining nuts and bolts to 50 ft. lbs. (68 Nm) on 4WD vehicles or 28 ft. lbs. (38 Nm) on 2WD vehicles.

Torque the ball stud nut to 100 ft. lbs. (136 Nm) and install a new cotter pin.

4. Lubricate the ball joint with a grease gun.

5. Adjust the riding height, if equipped with a torsion bar and align the front end.

REMOVAL & INSTALLATION

2WD Pick-Up and Ram 50

1. Raise the vehicle and support safely. Remove the tire and wheel assembly.

2. Remove the shock absorber.

3. Install Mitsubishi spring com-

pressor tool MB990792 or Chrysler tool DD-1278, or equivalent to the coil spring to compress the spring.

4. Remove the cotter pin and upper ball joint nut.

5. Suspend the rotor assembly with a wire so there is not excessive pull on the brake hose.

6. Release the upper ball joint taper using Mitsubishi tool MB990809-01 or Chrysler tool C-3564-A, or equivalent.

7. Remove the tool and remove the ball stud from the knuckle.

8. Loosen the pivot bar retaining nuts and bolts, identify and remove the alignment shims, remove the nuts and bolts and remove the arm from the vehicle.

To install:

9. Install the arm to the frame rail bracket, install the shims in their original locations and install the retaining nuts and bolts. Torque the nuts initially to about 40 ft. lbs. (54 Nm).

10. Torque the ball joint nut to 60 ft. lbs. (81 Nm). Install a new cotter pin. Remove the spring compressor.

11. Install the shock absorber.

12. Align the front end. When all settings are at specifications, torque the pivot bar retaining bolts to 80 ft. lbs. (109 Nm).

Montero, Raider and 4WD Pick-Up and Ram 50

1. Raise the vehicle and support safely. Remove the skid plate.

2. Remove the shock absorber.

3. Turn the torsion bar adjustment nut counterclockwise to relieve all tension from the torsion bar. Disconnect the brake hose from the brake line and remove the hose from the bracket.

4. Remove the cotter pin from the upper ball stud.

5. Release the upper ball joint taper using Mitsubishi tool MB990809-01 or Chrysler tool C-3564-A, or equivalent. Remove the tool. Remove the ball stud from the steering knuckle.

6. Loosen the pivot bar retaining nuts and bolts, identify and remove the alignment shims, remove the nuts and bolts and remove the arm from the vehicle.

7. Remove the arm from the vehicle.

To install:

8. Position the arm at the frame rail bracket.

9. Install the shims in their original locations and install the retaining nuts and bolts. Torque the nuts initially to about 40 ft. lbs. (54 Nm).

10. Insert the upper ball stud in the steering knuckle arm bore and install the nut. Torque the nut to 60 ft. lbs. (81 Nm) and install a new cotter pin.

Front suspension components - Van

Install the shock absorber and attach the brake hose.

11. Turn the torsion bar adjustment nut clockwise to apply a load on the bar.

12. Lower the vehicle.

13. Set the riding height and align the front end.

Van

1. Raise the vehicle and support safely.

2. Remove the rubber splash shield. Remove the shock absorber.

3. Turn the torsion bar adjustment nut counterclockwise to relieve all tension from the torsion bar. Remove the nuts and bolts that attach the front torsion bar anchor to the upper control arm.

4. Suspend the rotor assembly with a wire so there is not excessive pull on the brake hose. Remove the cotter pin from the upper ball stud.

5. Release the upper ball joint taper using Mitsubishi tool MB990809-01, or equivalent. Remove the tool. Remove the ball stud from the steering knuckle.

6. Remove the pivot bar retaining

nuts and bolts and remove the arm from the vehicle.

7. Remove the arm from the vehicle.

To install:

8. Position the arm at the frame rail bracket.

9. Install the retaining nuts and bolts. Torque the nuts to 100 ft. lbs. (136 Nm).

10. Insert the upper ball stud in the steering knuckle arm bore and install the nut. Torque the nut to 100 ft. lbs. (136 Nm) and install a new cotter pin. Install the shock absorber.

11. Turn the torsion bar adjustment nut clockwise to apply a load on the bar.

12. Lower the vehicle.

13. Set the riding height and align the front end.

Lower Control Arm

REMOVAL & INSTALLATION

2WD Pick-Up and Ram 50

1. Raise the vehicle and support safely.

2. Remove the shock absorber.

3. Disconnect the sway bar and strut bar from the lower control arm.
4. Install Mitsubishi spring compressor tool MB990792 or Chrysler tool DD-1278, or equivalent to the coil spring and compress the spring.

5. Remove the cotter pin and lower ball joint nut.

6. Release the lower ball joint taper using Mitsubishi tool MB990809-01 or Chrysler tool C-3564-A, or equivalent.

7. Remove the tool and remove the ball stud from the knuckle. Remove the spring compressor.

8. Pull the arm down and remove the spring with the rubber isolation pad from the vehicle. Remove the lower arm shaft mounting nuts and remove the arm from the vehicle.

To install:

9. Install the arm to the crossmember finger tight. Install the spring with the rubber isolators. Install the compressor tool and compress it enough so the lower ball joint can be inserted through the knuckle.

10. Torque the lower ball joint nut to 100 ft. lbs. (136 Nm). Install a new cotter pin. Remove the spring compressor.

11. Connect the sway bar and strut bar to the lower control arm.

12. Install the shock absorber.

13. Lower the vehicle completely. When the weight of the vehicle is completely off of the lifting apparatus, torque the lower control arm to crossmember mounting nut to 50 ft. lbs. (68 Nm).

14. Align the front end.

Montero, Raider and 4WD Pick-Up and Ram 50

1. Raise the vehicle and support safely.

2. Remove the skid plate.

3. Remove the torsion bar, anchors and lower arm shaft.

4. Remove the shock absorber lower attaching bolt.

5. Disconnect the stabilizer bar from the lower control arm.

6. Remove the cotter pin and the nut from the lower ball stud. Separate the lower ball stud from the steering knuckle using a suitable puller.

7. Remove the pivot bolts and remove the arm from the vehicle.

To install:

8. Install the new control arm to the vehicle.

9. Install the pivot bolts, but do not torque yet.

10. Insert the ball stud into the steering knuckle bore. Install the nut, torque to 100 ft. lbs. (136 Nm) and install a new cotter pin.

11. Attach the stabilizer bar to the

control arm and install the shock mount bolts.

12. Install the torsion bar and turn the adjustment bolt clockwise to apply a load to the bar.

13. Lower the vehicle so the weight of the vehicle is completely off of the lifting apparatus.

14. Torque the pivot nuts to 110 ft. lbs. (149 Nm).

15. Set the riding height and align the front end.

Van

1. Raise the vehicle and support safely.

2. Remove the under cover.

3. Remove the shock absorber.

4. Disconnect the strut bar and stabilizer bar from the lower control arm.

5. Remove the cotter pin and the nut from the lower ball stud. Separate the lower ball stud from the steering knuckle using a suitable puller.

6. Matchmark the head of the cam bolt to the alignment reference plate and remove the bolt, washer and nut.

7. Remove the arm from the vehicle.

To install:

8. Install the arm to the crossmember and install the bolt aligning the matchmarks. Torque the nut to about 40 ft. lbs. (54 Nm).

9. Insert the ball stud into the steering knuckle bore. Install the nut, torque to 100 ft. lbs. (136 Nm) and install a new cotter pin.

10. Install the strut bar and stabilizer bar to the control arm.

11. Install the shock absorber.

12. Align the front end. When all setting are at specifications, torque the lower arm pivot bolt nut to 110 ft. lbs. (149 Nm).

Stabilizer Bar

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. Remove the front sway bar brackets and retainers.

3. Remove the sway bar support brackets and bushings from the lower control arm. Remove the sway bar from the vehicle.

4. The installation is the reverse of the removal procedure.

Front Wheel Bearings

For 4WD applications, please refer to "Drive Axles" in the Unit Repair section.

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. Remove the tire and wheel assembly.

3. Remove the caliper, disc brake pads and adaptor.

4. Remove the dust cap.

5. Remove the cotter pin, castellated nut lock, wheel bearing nut and washer from the spindle.

6. Remove the outer wheel bearing.

7. Remove the hub and rotor assembly with the inner wheel bearing from the spindle. Remove the grease seal.

To install:

8. Lubricate and install the inner wheel bearing. Install a new grease seal.

9. Install the hub and rotor assembly to the spindle.

10. Lubricate and install the outer wheel bearing, washer and nut. When the bearing preload is properly set, install the nut lock and a new cotter pin.

11. Install the grease cap.

12. Install the brake pads and caliper.

13. Install the wheel.

ADJUSTMENT

1. Tighten the wheel bearing nut to 22 ft. lbs. (30 Nm) while turning the rotor.

2. Loosen the wheel bearing adjusting nut completely.

3. Tighten the nut to 6 ft. lbs. (8 Nm).

4. Check the wheel bearing endplay. The specification is 0.0001-0.003 in.

5. Install the nut lock and cotter pin.

REAR SUSPENSION

Shock Absorber

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely. If the vehicle is equipped with rear coil springs, support the rear axle using the proper equipment.

2. Remove the bolts that attach the shock to the frame or bracket.

3. Remove the shock from the vehicle.

4. The installation is the reverse of the removal procedure.

Coil Springs

REMOVAL & INSTALLATION

Montero and Raider with 3.0L Engine

1. Raise the vehicle and support safely. Remove the parking brake cable attaching bolt.
2. Using the proper equipment, support the weight of the axle.
3. Remove the bolt that attaches the lateral rod to the body.

4. Remove the lower shock mounting bolts.
5. Lower the axle and remove the coil springs with their seats.
6. The installation is the reverse of the removal procedure.

Leaf Springs

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely. Remove the parking brake cable attaching bolt.

2. Using the proper equipment, support the weight of the axle.
3. Remove the nuts, washers and U-bolts attaching the springs to the axle housing. Remove the seat and spacer.
4. Remove the spring shackle bolts, shackle and spring front bolt.
5. Remove the springs from the vehicle.
6. The installation is the reverse of the removal procedure. Make sure all mounting nuts are on the inside of the springs.

ENGINE ELECTRICAL

NOTE: Disconnecting the negative battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is reconnected.

Distributor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Disconnect the distributor cap retaining clips and remove the distributor cap with the plug wires attached.
3. Using a piece of chalk, make alignment marks on the distributor-to-engine and rotor-to-distributor locations; the alignment marks are used for reinstallation.
4. Disconnect the distributor electrical harness connector.
5. Remove the distributor-to-engine bolt and lift the distributor assembly from the engine.
6. If the engine was undisturbed, install the distributor, align the matchmarks and reverse the removal procedures. Check and/or adjust the timing.
7. If the crankshaft was turned, the engine disturbed in any manner (while the distributor was removed) or alignment marks were not drawn, perform the following procedures:
 - a. Remove the No. 1 cylinder spark plug.
 - b. Turn the crankshaft until the No. 1 piston is positioned on the Top Dead Center (TDC) of the compression stroke.

Exploded view of the distributor—2.4L engine 1986-89

NOTE: To determine the TDC of the compression stroke, place

Exploded view of the distributor—3.0L engine

your thumb over the spark plug hole and feel the air being forced from the cylinder. Stop turning the crankshaft when the timing marks, used to time the engine, are aligned.

c. Oil the distributor housing-to-cylinder block surface.

d. Install the distributor so the rotor points toward the No. 1 spark plug terminal tower of the distributor cap (when installed).

e. When the distributor shaft has reached the bottom of the hole, move the rotor back and forth slightly until the driving lug on the end of the shaft enters the slots cut in the end of the oil pump shaft and

the distributor assembly slides down into place.

8. To complete the installation, reverse the removal procedures. Check and/or adjust the ignition timing.

Ignition Timing

ADJUSTMENT

Gasoline Engine

The ignition timing is controlled by the ECM.

1. Locate the timing marks on the crankshaft pulley and the front of the engine.

2. Clean the timing marks.

3. Using chalk or white paint, color the mark on the crankshaft pulley and the mark on the scale which will indicate the correct timing when aligned with the notch on the crankshaft pulley.

4. Attach a tachometer to the engine.

5. Attach a timing light to the engine, according to the manufacturer's instructions.

6. If equipped with air conditioning, turn it **OFF**.

7. Check to make sure all of the wires clear the fan, then, start the engine and allow it to reach normal operating temperatures.

8. Block the front wheels and set the parking brake. Shift the transmission into **NEUTRAL** for manual transmission or **D** for automatic transmission; do not stand in front of the vehicle when making adjustments.

9. Perform the following procedures:

a. Race the engine at 2000 rpm for about 2 minutes under a no-load condition; make sure all of the accessories are turned **OFF**.

b. Run the engine at idle speed.

c. Race the engine 2–3 times under no-load, then, run it for 1 minute at idle.

10. Adjust the idle to the correct setting.

11. Aim the timing light at the timing marks. If the marks on the pulley and the engine are aligned when the light flashes, the timing is correct. Turn the engine **OFF** and remove the tachometer and the timing light. If the marks are not in alignment, proceed with the following steps.

12. Turn the engine **OFF**.

13. Loosen the distributor lockbolt just enough so the distributor can be turned with a little effort.

14. Start the engine. Keep the wires of the timing light clear of the fan.

15. With the timing light aimed at the pulley and the marks on the engine, turn the distributor in the direction of rotor rotation to retard the

spark or in the opposite direction to advance the spark. Align the marks on the pulley and the engine with the flashes of the timing light.

16. Tighten the distributor lockbolt and recheck the timing.

Diesel Engine

The ignition timing is controlled by the position of the fuel injection pump. Locate the injection pump and inspect the alignment of the timing marks (one on the engine and the injection pump). If necessary, loosen the injection pump-to-engine bolts, then, turn the pump to align the timing marks. Torque the injection pump-to-engine bolts to 14–18 ft. lbs.

Alternator

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

BELT TENSION ADJUSTMENT

Belt tension should be checked with a gauge made for the purpose. If a tension gauge is not available, tension can be checked with moderate thumb pressure applied to the belt at its longest span midway between pulleys. If the belt has a free span less than 12 in., it should deflect approximately $\frac{1}{8}$ – $\frac{1}{4}$ in. If the span is longer than 12 in., deflection can range between $\frac{1}{8}$ – $\frac{3}{8}$ in. To adjust or replace belts:

1. Loosen the alternator's pivot and mounting bolts.

2. Move the alternator toward or away from the engine until the tension is correct.

NOTE: Use a wooden hammer handle or broomstick, as a lever but do not use anything metallic, such as a pry bar.

3. Tighten the bolts and recheck the tension. If new belts have been installed, run the engine for a few minutes, then, recheck and readjust as necessary. It is better to have belts too loose than too tight, because overtight belts will lead to bearing failure, particularly in the water pump and alternator. However, loose belts place an extremely high impact load on the driven component due to the whipping action of the belt.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Disconnect the electrical connector from the alternator.

3. Loosen the drive belt adjusting bolt, push the alternator toward the engine and remove the drive belt.

4. Remove the alternator-to-bracket bolts and the alternator from the vehicle.

5. To install, reverse the removal procedures. Adjust the drive belt tension. Torque as follows:

Alternator-to-lower bracket bolt
Gasoline engine—27–37 ft. lbs.

Diesel engine—20–27 ft. lbs.

Alternator-to-adjusting bracket bolt
Z24i and KA24E engines—6–8 ft. lbs.

VG30i and VG30E engines—10–12 ft. lbs.

Diesel engine—8–10 ft. lbs.

Starter

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

REMOVAL & INSTALLATION

1. If necessary, raise and safely support the vehicle.

2. Disconnect the negative battery cable.

3. Disconnect the electrical connectors from the starter, taking note of the positions for reinstallation purposes.

4. Remove the starter-to-engine bolts and the starter from the vehicle.

5. To install, reverse the removal procedures. Torque the starter-to-transmission bolts to 29–36 ft. lbs.

Diesel Glow Plugs

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Disconnect the glow plug electrical leads. Remove the glow plug connecting plate.

3. Remove the glow plugs from the cylinder head.

4. Inspect the tips of the plugs for any evidence of melting. If one glow plug tip looks bad, replace all of the plugs.

5. To install, reverse the removal procedures.

TESTING

The glow plugs are tested by checking their resistance with an ohmmeter. The plugs can be tested either removed or installed in the cylinder head.

1. Disconnect the electrical connector from the glow plug.

2. Connect the positive (+) ohmmeter lead to the glow plug's electrical connector and the negative (-) lead to the glow plug's body.

3. If a minimum of continuity is shown, the glow plug is OK; if no continuity is shown, replace the glow plug.

CHASSIS ELECTRICAL

Heater Blower Motor

REMOVAL & INSTALLATION

Van

FRONT UNIT

1. Disconnect the negative battery cable.

2. Remove the package tray or glove box.

3. Disconnect the electrical connector from the blower motor.

4. Remove the blower motor-to-housing screws and the blower motor.

5. To install, reverse the removal procedures.

REAR UNIT

1. Disconnect the negative battery cable.

2. Remove the rear heater unit cover panel.

3. Disconnect the electrical connector from the blower motor.

4. Remove the blower motor-to-housing screws and the blower motor.

5. To install, reverse the removal procedures.

Except Van

The blower motor is accessible from under the right side of the instrument panel.

1. Disconnect the negative battery cable.

NOTE: On the Axxess, it may be necessary to remove the glove box or package tray.

2. Disconnect the electrical connector from the blower motor.

3. Remove the blower motor-to-heater unit screws and the blower motor from the unit.

4. To install, reverse the removal procedures.

Windshield Wiper Motor

REMOVAL & INSTALLATION

Front

1. Disconnect the negative battery cable.

2. Remove the wiper blades and arms as an assembly from the pivots. The arms are retained to the pivots by nuts; remove the nuts and pull the arms straight off.

3. Remove the cowl top grille screws (from the front edge) and pull the grille forward to disengage the rear tabs.

4. Remove the wiper motor arm-to-connecting rod stop ring.

5. From under the instrument panel, disconnect the electrical connector from the wiper motor harness.

6. Remove the wiper motor-to-cowl screws and the wiper motor from the vehicle.

NOTE: If the motor has been run, be sure the motor is in the PARK position before installing the wiper arms. To do this, turn the ignition switch ON and cycle the motor 3-4 times. Turn the motor OFF and allow the motor to return to the PARK position.

7. To install, reverse the removal procedures. The wiper arms should be installed so the blades are 0.98 in. (25mm) for Pick-Up and Pathfinder, 1.12 in. (55mm) driver's side and 0.20 in. (5mm) passenger's side for Van or 1.62 in. (40mm) for Axxess, above and parallel to the windshield molding.

NOTE: If the motor has been run, be sure the motor is in the PARK position before installing the wiper arms. To do this, turn the ignition switch ON and cycle the motor 3-4 times. Turn the motor OFF and allow the motor to return to the PARK position.

Rear Except Pick-Up

1. Disconnect the negative battery cable.

2. From the rear door, remove the wiper blade/arm as an assembly from the pivot. The arm is retained to the pivots by a nut; remove the nut and pull the arm straight off.

3. From inside the rear door, remove wiper motor cover plate.

4. Remove the wiper motor arm-to-connecting rod stop ring.

5. Disconnect the electrical connector from the rear wiper motor harness.

6. Remove the wiper motor-to-rear door screws and the wiper motor from the vehicle.

NOTE: If the wiper motor has been run, be sure the motor is in the PARK position before installing the wiper arms. To do this, turn the ignition switch ON and cycle the motor 3-4 times. Turn the motor OFF and allow the motor to return to the PARK position.

7. To install, reverse the removal procedures.

Windshield Wiper Switch

The windshield wiper switch is a part of the combination switch located on the steering column.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the shell covers-to-steering column screws and the covers from the steering column.

3. Disconnect the windshield wiper switch electrical connector.

4. Remove the windshield wiper switch-to-combination switch screws and the windshield wiper switch from the steering column.

5. To install, reverse the removal procedures.

Instrument Cluster

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the instrument cluster bezel screws and the bezel.

3. Remove the instrument cluster-to-dash screws and pull the cluster assembly forward.

4. Disconnect the electrical connectors from the rear of the instrument cluster.

5. To install, reverse the removal procedures.

Headlight Switch

The headlight switch is a part of the combination switch located on the steering column.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the shell covers-to-steering column screws and the covers from the steering column.

3. Disconnect the headlight/turn signal switch electrical connector.

4. Remove the headlight/turn signal

switch-to-combination switch screws and the headlight/turn signal switch from the steering column.

5. To install, reverse the removal procedures.

Dimmer Switch

The dimmer switch is a part of the combination switch located on the steering column.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the shell covers-to-steering column screws and the covers from the steering column.
3. Disconnect the dimmer switch electrical connector.
4. Remove the dimmer switch-to-combination switch screws and the dimmer switch from the steering column.
5. To install, reverse the removal procedures.

Turn Signal Switch

The turn signal switch is a part of the combination switch located on the steering column.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the shell covers-to-steering column screws and the covers from the steering column.
3. Disconnect the turn signal switch electrical connector.
4. Remove the turn signal switch-to-combination switch screws and the turn signal switch from the steering column.
5. To install, reverse the removal procedures.

Combination Switch

The combination switch consists of the headlight, windshield wiper/washer, turn signal and dimmer switches.

NOTE: The switches can be removed from the combination switch base without removing the base.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the horn pad and the steering wheel nut. Using the puller tool, press the steering wheel from the steering column.

Exploded view of the combination switch

3. Disconnect the wiring harness from the clip which retains it to the lower instrument panel.
4. Disconnect the electrical connectors from the combination switch.
5. Remove the steering column shell cover screws and the covers (upper and lower).
6. Loosen the combination switch-to-steering column screw and remove the switch assembly.
7. To install, align the hole in the steering column with the protrusion on the switch body and reverse the removal procedures.

Ignition Lock/Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. From the upper steering column, remove the shell cover screws and the covers.
3. Disconnect the electrical connector from the rear of the ignition switch.
4. Using a drill, remove the self-shear type screws from the ignition switch.
5. Remove the screws and the ignition switch.
6. To install, reverse the removal procedures. Torque the shear-type screws until the heads shear.

Stoplight Switch

The stop light switch is attached to a bracket at the top of the brake pedal.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. From under the dash, disconnect the electrical connector from the stop light switch.
3. Loosen and remove the locknut from the stop light switch.
4. Unscrew the stop light switch from the brake pedal bracket.

NOTE: To adjust the stop light switch, the engine must be running.

5. To install, reverse the removal

procedures. Perform the brake pedal height and freeplay adjustments. Torque the stop light switch locknut to 9–11 ft. lbs.

Adjustment

To perform this procedure the engine must be running.

1. Depress the brake pedal until pushrod resistance is felt.
2. Using a 0.012–0.039 in. feeler gauge, measure stop light switch-to-brake pedal gap.
3. If necessary, disconnect the electrical connector from the stop light switch, loosen the stop light switch locknut and adjust the stop light switch.
4. After adjustment, torque the stop light switch locknut to 9–12 ft. lbs.

Clutch Switch

The clutch switch is normally attached to a bracket that is mounted to the upper portion of the clutch pedal bracket.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector from the clutch switch.
3. Loosen the locknut and unscrew the switch from the bracket.
4. To install, screw the clutch switch into the bracket until the following pedal height is established:

Pick-Up and Pathfinder

Z24i, KA24E and SD25 engines—9.29–9.69 in. (236–246mm)

VG30i and VG30E engines—8.94–9.33 in. (227–237mm)

Van

Z24i engine—6.97–7.25 in. (177–184mm)

Axxess

KA24E engine—6.97–7.36 in. (177–187mm)

NOTE: The pedal height is the distance from the floor board to the front center of the clutch pedal.

5. Torque the clutch switch locknut to 9–11 ft. lbs. (12–15 Nm).
6. Connect the negative battery cable.

Clutch Interlock Switch

The clutch interlock switch is normally attached to a bracket that is mounted to the cowl.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

View of the clutch pedal and clutch switch adjustments—typical

View of the clutch interlock switch adjustment—Typical

2. Disconnect the electrical connector from the clutch interlock switch.

3. Loosen the locknut and unscrew the switch from the bracket.

4. To install, use a feeler gauge and screw the clutch interlock switch into the bracket.

5. Fully, depress the clutch pedal and adjust the gap between the clutch pedal stopper bracket and the threaded end of the clutch interlock switch to:

Pick-Up, Pathfinder and Van
0.012–0.039 in. (0.3–1.0mm)

Axxess
0.059–0.138 in. (1.5–3.5mm)

6. Torque the clutch interlock switch locknut to 9–11 ft. lbs. (12–15 Nm).

7. Connect the negative battery cable.

Fuses and Circuit Breakers

LOCATION

The fuse block is located under the left side of the dash for 1986–87 Pick-Up, 1986–87 Pathfinder, Van and 1990 Axxess or under the right side of the steering column for the 1988–90 Pick-Up and Pathfinder or under a cover panel located on the left side of the steering column.

Fusible links are located at the right front fender for 1986–87 Pick-Up and Pathfinder.

ENGINE COOLING

Radiator

REMOVAL & INSTALLATION

Axxess

1. Disconnect the negative battery cable.

2. Disconnect the electrical connectors from the cooling fans.

3. Remove the fan shroud-to-chassis bolts and the shroud.

4. Raise and safely support the vehicle.

5. Drain the cooling system.

6. Remove the upper and lower cooling hoses from the radiator. Remove the reservoir hose from the radiator. If necessary, remove the coolant reservoir.

7. If equipped with an automatic transaxle, disconnect and plug oil coolant lines from the radiator.

8. Remove the upper radiator-to-chassis bolts and lift the radiator from the vehicle.

9. To install, reverse the removal procedures. Refill the cooling system.

10. Start the engine, allow it to reach normal operating temperatures and check for leaks.

Except Axxess

1. Disconnect the negative battery cable.

2. Drain the engine cooling system.

3. On the Van, remove the upper radiator hoses and radiator cap assembly. On all except Van, remove the upper and lower radiator hoses.

4. If equipped with an automatic transmission, disconnect and plug the transmission oil cooler lines at the radiator.

5. Remove the radiator shroud and the radiator.

6. To install, reverse the removal procedures.

7. If equipped with an automatic transmission, check and/or refill the transmission. Refill the cooling system.

Electric Cooling Fan

REMOVAL & INSTALLATION

Axxess

1. Disconnect the negative battery cable.

2. Disconnect the electrical connectors from the cooling fans.

3. Remove the fan shroud-to-chassis bolts and the shroud.

4. Remove fan blade assembly-to-fan motor nut(s) and the fan blade assembly(s).

5. Remove the cooling fan motor(s)-to-shroud bolts and the fan motor(s).

6. To install, reverse the removal procedures.

TESTING

The cooling fans are controlled by the ECU; testing must be performed on the vehicle.

1. Turn the air conditioning switch OFF.

2. Start the engine and allow it to reach normal operating temperatures.

a. With the coolant temperature below 201°F (94°C), both fans will not operate.

b. With the coolant temperature at 203°F–210°F (95°C–99°C), 1 fan will operate at low speed; relay 1 will be turned ON.

c. With the coolant temperature

above 212°F (100°C), both fans will operate at high speed; relay 1 and relay 2 will be turned ON.

3. Turn the air conditioning and blower fan switches ON; the evaporator outlet air temperature should be over 46°F (8°C).

a. With the coolant temperature below 201°F (94°C), both fans will operate at high speed; relay 1 and relay 2 will be turned ON.

NOTE: If the vehicle speed is above 50 mph (80 km/h), the cooling fans will not operate.

b. With the coolant temperature at 203°F–210°F (95°C–99°C), both fans will operate at high speed; relay 1 and relay 2 will be turned ON.

NOTE: If the vehicle speed is above 50 mph (80 km/h), the cooling fans will operate at low speed.

c. With the coolant temperature above 212°F (100°C), both fans will operate at high speed; relay 1 and relay 2 will be turned ON.

4. With the air conditioning and blower fan switches turned ON and the evaporator outlet air temperature at 37°F–46°F (3°C–8°C).

a. With the coolant temperature below 201°F (94°C), 1 fan will operate at low speed; relay 1 will be turned ON.

NOTE: If the vehicle speed is above 50 mph (80 km/h), the cooling fans will not operate.

b. With the coolant temperature at 203°F–210°F (95°C–99°C), 1 fan will operate at low speed; relay 1 will be turned ON.

c. With the coolant temperature above 212°F (100°C), both fans will operate at high speed; relay 1 and relay 2 will be turned ON.

Heater Core

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Drain the cooling system to a level below the heater core.
3. Disconnect the heater hose from the engine.
4. Remove the console box and instrument assembly.
5. Disconnect the electrical connectors from the heater unit. Disconnect the air intake control cable from the blower unit.
6. Remove the blower unit. Remove the evaporator unit nuts/bolts but do not remove the unit.
7. Remove the heater assembly and separate the core from the assembly.

VENTILATION DOOR

FLOOR/DEFROSTER DOOR

Exploded view of a typical heater core assembly

View of the water cock control rod adjustment—except Axcess

View of the water cock control rod adjustment—Axcess

8. To install, reverse the removal procedures. Adjust the heater control cable for proper operation. Refill the cooling system. Operate the engine until normal operating temperatures are reached, then, check for leaks.

Water Pump

REMOVAL & INSTALLATION

Axcess

1. Disconnect the negative battery cable.
2. Position a clean drain pan under the radiator, remove the drain plug, remove the radiator cap and drain the engine coolant.

3. If necessary, remove the upper radiator hose.

4. Loosen the alternator-to-bracket bolts, move the inward and remove the drive belt.

5. Remove the drive pulley-to-water pump bolts and the pulley.

6. Remove the water pump-to-water pump housing bolts and the pump with the gasket.

7. Clean the gasket mounting surfaces.

8. To install, use a new gasket, sealant (if necessary) and reverse the removal procedures. Torque the water pump-to-water pump housing bolts to 12–15 ft. lbs. (16–21 Nm), the drive pulley-to-water pump bolts to 5.1–5.8 ft. lbs. (7–8 Nm). Adjust the drive belt tension. Refill the cooling system. Run the engine until normal operating temperatures are reached, then, inspect for leaks.

Except Axcess

1. Disconnect the negative battery cable.
2. Position a clean drain pan under the radiator, open the drain cocks, remove the radiator cap and drain the engine coolant. If equipped with a diesel engine, remove the bypass hose from the pump.

NOTE: If equipped with a diesel engine, open the drain cocks on the engine. After draining the coolant, remove the thermostat coolant hose from the water pump.

3. Remove the upper radiator shroud screws and the shroud.

4. Loosen the alternator-to-bracket bolts, move the inward and remove the drive belt.

NOTE: If equipped with power steering, remove the drive belt.

Exploded view the water pump assembly—1990 2.4L engine—Axxess

5. Remove the fan-to-water pump bolts and the fan.

6. Remove the water pump-to-engine bolts and the pump with the fan pulley, coupling and gasket.

7. Clean the gasket mounting surfaces.

8. To install, use a new gasket, sealant (if necessary) and reverse the removal procedures. Torque as follows:

Water pump-to-engine bolts

6mm bolts, 2.4L engine—3-7 ft. lbs.

8mm bolts, 2.4L engine—7-12 ft. lbs.

3.0L engine—12-15 ft. lbs.

8mm bolts, 2.5L diesel engine—7-9 ft. lbs.

10mm bolts, 2.5L diesel engine—14-18 ft. lbs.

9. Adjust the drive belt tension. Refill the cooling system. Run the engine until normal operating temperatures are reached, then, inspect for leaks.

View the water pump assembly—2.4L engine—except Axxess

NOTE:The thermostat spring must face the inside of the engine.

5. Clean the gasket mounting surfaces.

NOTE: If the thermostat, is equipped with an air bleed or jiggle valve, be sure to position it in the upward direction.

6. To install, use a new gasket, sealant (if necessary) and reverse the removal procedures. Torque as follows:

Water outlet-to-thermostat housing bolts

Z24i, VG30i and VG30E engines—12-15 ft. lbs. (16-21 Nm)

KA24E engine—5.1-5.8 ft. lbs. (7-8 Nm)

SD25 diesel engine—7-9 ft. lbs.

COOLING SYSTEM BLEEDING

1. Move the temperature control lever fully, to the **HOT** position.

2. If the radiator drain cock was opened or the engine drain plug was remove, close the drain cock and/or install the drain plug.

3. Fill the radiator.

4. Operate the engine until it warms up, stop it and allow it to cool down.

Thermostat

The factory-installed thermostat opening temperature is 180°F (USA) or 190°F (Canada). On the Z24i engines, the thermostat is located on the right, front-side of the intake manifold; on the KA24E engine used with the Axxess, the thermostat is enclosed in the water pump housing, attached to the left side of the engine; on the all other engines, the thermostat is located above the water pump.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Drain the engine coolant to a level below the thermostat housing.

3. Disconnect the coolant hose from the thermostat water outlet.

4. Remove the water outlet-to-thermostat housing bolts, gasket and thermostat.

Exploded view of the water pump assemblies—3.0L engine

Exploded view of the water pump assembly—2.5L diesel engine

View of the air relief plug—2.4L engine—except Axxess

View of the air relief plug—3.0L engine

View of the air relief plug—1990 2.4L engine—Axxess

5. If equipped with an air relief plug, open it to bleed of the trapped air.

6. Repeat the refilling, warming and cooling operation 2–3 times.

7. Make sure the radiator is filled to the tank neck. Fill the reservoir to the MAX level.

GASOLINE FUEL SYSTEM

Fuel System Service Precaution

Disconnect the negative battery cable.

Keep a Class B dry chemical fire extinguisher available. Always relieve the fuel pressure before disconnecting a fuel line. Wrap a shop cloth around the fuel line when disconnecting a fuel line. Always use new O-rings. Do not replace the fuel pipes with fuel hoses. Always use a back-up wrench when opening or closing a fuel line.

RELIEVING FUEL SYSTEM PRESSURE

1. From the fuse box, remove the fuel pump fuse.
2. Start the engine and allow it to run.
3. After the engine stalls, crank it 2–3 times to make sure the pressure is released.
4. Turn the ignition switch **OFF** and replace the fuse.

Fuel Filter

REMOVAL & INSTALLATION

Axxess

The fuel filter is located under the driver's side and attached to the chassis; it is concealed by a cover plate.

1. Relieve the fuel pressure.
2. Disconnect the negative battery cable.
3. Raise and safely support the vehicle.
4. Remove the fuel filter cover plate.
5. Loosen the hose clamps at the fuel inlet and outlet lines and slide each line off the filter nipples.
6. Remove the fuel filter.
7. Replace the fuel filter; be sure to use new hose clamps and the fuel filter arrows are facing the front of the vehicle.

Except Axxess

The fuel filter is located in the right side of the engine compartment beside to the engine.

1. Release the fuel pressure.
2. Disconnect the negative battery cable.
3. Loosen the hose clamps at the fuel inlet and outlet lines and slide each line off the filter nipples.
4. Remove the fuel filter.
5. Replace the fuel filter; be sure to use new hose clamps and the fuel filter arrows are facing the engine.

Electric Fuel Pump

The fuel pump is located in the fuel tank which must be removed to remove the fuel pump.

PRESSURE TESTING

1. Disconnect the hose from the pump outlet at the pump.
2. Connect a length of hose to the outlet. The hose should have an inside diameter of 1/4 in. (6mm). The diameter of the hose is important for accurate measurements.
3. Raise the end of the hose above the level of the pump. Turn the ignition switch **ON** and catch the gasoline in a graduated container. Pump output should be 1400cc in a minute or less.

REMOVAL & INSTALLATION

1. Relieve the fuel pressure. Disconnect the negative battery cable.
2. Siphon the fuel from the fuel tank.

NOTE: If fuel tank is equipped with a drain plug, remove the plug and drain the fuel into a proper fuel container.

3. Raise and safely support the vehicle.
4. Disconnect the fuel lines and the electrical connector(s) from the fuel pump assembly.

NOTE: For 4WD models, remove the fuel tank protector from the bottom of the fuel tank.

5. Remove the fuel tank filler tube-to-vehicle bolts (Pick-Up) or nuts (Van) and the outer plate.
6. Remove the fuel tank-to-chassis connectors and lower the tank from the vehicle.
7. Remove the fuel pump assembly-to-tank screws and lift the assembly from the tank.
8. To install, use a new fuel pump assembly-to-tank O-ring and reverse the removal procedures. Torque the fuel pump assembly-to-tank screws to 18–24 inch lbs. and the fuel tank protectors-to-chassis bolts to 20–26 ft. lbs. Refill the fuel tank.

Fuel Injection

IDLE SPEED ADJUSTMENT

1. Visually inspect the air cleaner for clogging, the hoses/ducts for leaks, the EGR valve operation, the electrical connectors, the gaskets, the throttle valve and throttle sensor operation and the AIV hose.
2. Set the parking brake and place the gear selector in N. Start the engine and allow it to reach normal operating temperatures.
3. Operate the engine, under no-load, for 2 minutes at about 2000 rpm.

Location of the Idle speed screw – 1986-89 3.0L engine – 1986-89 2.4L engine similar

Location of the Idle adjusting screw – 1990 3.0L engine

Location of the Idle adjusting screw – 1990 2.4L engine

4. Race the engine 2-3 times (under no-load) and operate it at idle speed for 1 minute.

5. If equipped with an automatic transmission, place the gear selector in D. Check and/or adjust the idle speed.

6. Using a timing light, check and/or adjust the ignition timing.

NOTE: If the ignition timing is not correct, turn the distributor to the correct value, then, reperform the idle speed adjustment until both values are correct.

Fuel Injector

REMOVAL & INSTALLATION

1986-89

Dual fuel injectors are located in the throttle body.

1. Relieve the fuel pressure. Disconnect the negative battery cable.

2. Drain about 1½ qt. (1L) of coolant from the engine.

3. From the throttle body, remove or disconnect the following items:

- Air cleaner
- Electrical connectors from the throttle sensor, idle switch, fuel injectors, air flow meter and the Automatic Speed Control Device (ASCD), if equipped
- Accelerator cable
- Fuel and coolant hoses

4. Remove the throttle body-to-intake manifold nuts and the throttle body.

5. Remove the rubber seal and the injector harness grommet from the throttle body.

6. Remove the injector cover-to-injector body screws and the cover from the throttle body.

7. Turn the throttle valve to the fully open position. Place a hollow pipe, with the inside diameter of not less than 0.217 in., on the bottom of the fuel injectors and tap the injectors from the throttle body.

NOTE: If the injector tip becomes deformed by the pipe, it should be replaced.

8. If replacing an injector with a new one, perform the following operation:

- Disconnect the faulty injector wires from the electrical connector, then, cut the injector wires from the metal terminals and pull the injector wiring from the harness tube.
- Using a new injector(s), install it into the harness tube and connect new terminals to the injector wires.

NOTE: Be sure to install a new electrical harness grommet every time a new injector is installed.

- Install the terminals into the electrical harness connector.

To install:

9. To install, use new O-rings (on the fuel injectors) and push the injectors into the throttle body until the O-rings are fully seated.

NOTE: Invert the throttle body to make sure the injector tips are properly seated.

10. Using silicone sealant, apply it to the injector harness grommet.

NOTE: An airtight seal is essential to ensure a stable and proper idling condition.

11. Using locking sealant, coat the injector cover screw threads, install the injector cover-to-throttle body screws. Torque the injector cover screws in a criss-cross pattern to 1.5-2.5 ft. lbs.

12. Using silicone sealant, coat the

View of a typical 1986-89 fuel injector assembly

top of the throttle body and install the air cleaner rubber seal.

NOTE: Do not install the air cleaner until the air cleaner seal (silicone sealant) has hardened.

13. Install the throttle body and torque the throttle body-to-intake manifold nuts to 9-13 ft. lbs.

14. To complete the installation, reverse the removal procedures. Refill the cooling system. Start the engine, then, check for leaks and proper idling conditions. Stop the engine and check for dripping fuel on the throttle valve.

1990

2.4L ENGINE

The engine is equipped 4 fuel injectors, with one located at each cylinder.

- Relieve the fuel pressure.
- Disconnect the negative battery cable.
- Label and disconnect the electrical connectors from the fuel injectors.
- Disconnect the fuel rail from the fuel system.
- Remove the fuel rail from the intake manifold; pull the fuel rail with the injectors connected from the intake manifold.

6. Separate the fuel injectors from the fuel rail.

To install:

- Replace the fuel injector O-rings.
- Install the fuel injectors to the fuel rail.
- Lubricate the fuel injector O-rings with automatic transmission fluid and press them, with the fuel rail, into the intake manifold.
- Install the fuel rail-to-intake manifold bolts.
- Connect the fuel rail to the fuel system.
- Connect the electrical connectors to the fuel injectors.
- Connect the negative battery cable.
- Turn the ignition switch ON and check for fuel leaks at the fuel rail.

3.0L ENGINE

The engine is equipped 6 fuel injectors, with one located at each cylinder.

1. Relieve the fuel pressure.
2. Disconnect the negative battery cable.
3. Remove the air cleaner from the throttle body.
4. Label and disconnect the vacuum hoses, electrical connectors and throttle cable from the throttle body/intake manifold collector assembly.
5. Remove the intake manifold collector-to-intake manifold bolts and the collector.
6. Disconnect the electrical connector(s) from the fuel injector(s).
7. Remove the fuel injector-to-fuel tube assembly clamp bolts and the clamp.
8. Pull the fuel injector from the fuel tube assembly. Remove and discard the O-rings.

To install:

9. Replace the fuel injector O-rings.
10. Lubricate the fuel injector O-rings with automatic transmission fluid and press them, into the fuel tube assembly.
11. Connect the electrical connectors to the fuel injectors.
12. Using a new gasket, install the intake manifold collector-to-intake manifold bolts. Torque the bolts to 13–16 ft. lbs. (18–22 Nm).
13. Connect the electrical connectors, the vacuum lines and the accelerator cable.
14. Install the air cleaner to the throttle body.
15. Connect the negative battery cable.
16. Turn the ignition switch ON and check for fuel leaks at the fuel rail.

DIESEL FUEL SYSTEM

Fuel System Service Precaution

Disconnect the negative battery cable. Keep a Class B dry chemical fire extinguisher available. Always relieve the fuel pressure before disconnecting a fuel line. Wrap a shop cloth around the fuel line when disconnecting a fuel line. Always use new O-rings. Do not replace the fuel pipes with fuel hoses. Always use a back-up wrench when opening or closing a fuel line.

Fuel Filter

There is a fuel filter and a sedimentor/fuel heater. Both units are found in the rear, right side of the engine com-

View of the fuel filter and sedimentor—2.5L diesel engine

partment, connected to a bracket attached to the firewall.

REMOVAL & INSTALLATION

1. Place a rag under the filter and the remove the fuel line.
2. Drain the fuel from the filter.
3. Unscrew the fuel filter from the bracket head.
4. Clean the fuel filter mounting surface on the bracket.
5. To install, use a new fuel filter, lubricate the rubber gasket with diesel fuel, screw it onto the bracket until it is snug and tighten it an additional $\frac{2}{3}$ turn.
6. Bleed the fuel system, start the engine and check for leaks.

DRAINING WATER FROM THE SYSTEM

NOTE: When the fuel filter warning light or buzzer turns ON, the water in the fuel filter must be drained immediately.

1. Raise the hood and position a small pan under the filter to catch the water.
2. Reach under the fuel filter and loosen the drain valve, 4–5 turns, until the water begins to flow; do not remove the drain valve/connector.
3. Depress the priming handle, located on top of the filter bracket, to speed the water removal from the filter. Pump the priming handle until only fuel is being removed from the system.

Location of the priming handle and air vent—2.5L diesel engine

Diesel Injection Pump

REMOVAL & INSTALLATION

1. Relieve the fuel pressure. Disconnect the negative battery cable.
2. Rotate the crankshaft to position the No. 1 cylinder on the TDC of its compression stroke.
3. Disconnect the injection tubes. Plug the nozzle openings and be careful not to damage the spill tube.
4. Label and disconnect the fuel cut solenoid harness.
5. Disconnect the accelerator wire, the overflow hose and the fuel inlet hose. Additionally, disconnect the cold start device water line and the fuel return hose; plug it also.
6. Loosen the bolts and remove the injection pump drive gear cover.
7. Loosen the drive gear nut and remove the gear with a 2-arm puller.
8. Loosen the mounting nuts/bolts and remove the injection pump with the injection tubes still attached.

To install:

9. Check that the No. 1 piston is still at TDC and position the injection pump so the pump flange aligns with the Y mark on the front cover. Install the drive gear and tighten the nut to 43–51 ft. lbs. (59–69 Nm).

Removing the drive gear cover—2.5L diesel engine

Removing the drive gear nut—2.5L diesel engine

Aligning the crankshaft timing marks—2.5L diesel engine

Checking that the Y marks on the gears are aligned—2.5L diesel engine

NOTE: Be careful not to allow the key to fall into the front cover and be absolutely certain that the Y marks are aligned.

10. Install the drive gear cover with a new gasket and adjust the plunger lift.
11. Tighten the injection pump mounting nut to 14–18 ft. lbs. (20–25 Nm) and the bolts to 12–16 ft. lbs. (16–22 Nm).
12. Install the injection tubes to the injectors. Bleed the system.

IDLE SPEED ADJUSTMENT

1. Release the cold start device system.
2. Check and/or adjust the timing.
3. Make sure the injection nozzles are in good condition.
4. Make sure the following items are in good condition:
 - a. Throttle chamber
 - b. Air cleaner unclogged
 - c. Glow system
 - d. Engine oil and coolant levels
 - e. Valve clearance
 - f. Air intake system
5. Firmly, engage the parking brake, block the wheels and move the shift lever into the N position.
6. Turn the air conditioner and headlights **OFF**.
7. Start the engine and allow it to reach normal operating temperatures.

View of the Idle speed adjusting screw—2.5L diesel engine

8. Turn all of the accessories **OFF**.
9. Connect a tachometer's pickup to the No. 1 fuel injection tube.
10. Operate the engine at about 2000 rpm for about 2 minutes under no-load.
11. Operate the engine at idle for 1 minutes.
12. Check and/or adjust the idle speed; the idle speed should be 650–800 rpm.
13. Stop the engine and remove the test equipment.

Diesel Injection Timing ADJUSTMENT

1. Remove the plug bolt from the distributor head and install a dial gauge.
2. Rotate the cold start device linkage clockwise and install a block of wood or paper (15mm) between the linkage and the device.
3. Set the No. 1 piston at TDC of the compression stroke and rotate the crankshaft counterclockwise 20–25 degrees. Check the gauge in this position and reset it to zero.
4. Rotate the crankshaft clockwise until the No. 1 piston is at TDC and read the gauge; the plunger lift should be 0.0374–0.0390 in. (0.95–0.99mm).
5. Adjust the plunger lift by rotating the injection pump until it is within range. Clockwise to decrease the measurement and counterclockwise to increase.
6. Tighten the injection pump mounting bolts. Disconnect the dial gauge and install the plug bolt with a new washer; torque it to 10–14 ft. lbs. (14–20mm).

Fuel Injector

REMOVAL & INSTALLATION

1. Relieve the fuel pressure.
2. Disconnect the negative battery cable.
3. Loosen the injection lines at the pump and nozzles and remove and plug the lines.
4. Unscrew the injector and holder from the cylinder head.

Install a dial gauge in the plug hole to check the plunger lift—2.5L diesel engine

Fabricate a wooden block about 15mm thick—2.5L diesel engine

Exploded view of the injection nozzle—2.5L diesel engine

Installing the nozzle gasket—2.5L diesel engine

5. Secure the nozzle holder in a vise and remove the locknut.
6. Remove the nipple.

7. Remove the nozzle holder body from the nozzle nut.
8. Remove the spacer collar and pushrod.
9. Remove the nozzle holder body from the vise, the nozzle spring and adjusting shims.

NOTE: The adjusting shims may be removed with a piece of wire but great care must be taken to avoid damage to the nozzle tip.

10. Clean fuel oil may be used to clean all parts. Inspect all parts for damage and good fit.

11. Assemble the nozzle in the reverse order of disassembly.

12. To install, reverse the removal procedures. Torque the nozzles and lines to 50–65 ft. lbs.

EMISSION CONTROLS

Please refer to "Emission Control" in the Unit Repair section for system maintenance procedures. Due to the complex nature of modern electronic engine control systems, comprehensive diagnosis and testing procedures fall outside the confines of this repair manual. For complete information on diagnosis, testing and repair procedures concerning all modern engine and emission control systems, please refer to "Chilton's Guide to Electronic Engine Controls".

Emission Warning Lamp

The check engine light is located on the instrument panel of California vehicles only and indicates an emission performance malfunction.

RESETTING

1. Turn the ignition switch **ON**.
2. If the check engine light turns **ON**, perform the self-diagnosis procedures to determine the malfunction.
3. Turn the ignition switch **OFF**.
4. Locate and repair the malfunction.

NOTE: When the malfunction is repaired, the check engine light will stay **OFF**.

5. After 50 starts, the malfunction information will be erased from the ECU memory.

GASOLINE ENGINE MECHANICAL

NOTE: Disconnecting the negative battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is reconnected.

Engine

REMOVAL & INSTALLATION

Pick-Up and Pathfinder

1. Disconnect the negative battery cable.

NOTE: On some vehicles, it may be necessary to remove the battery.

2. Using a scribing tool, mark the location of the hood hinges on the body and remove the hood.

3. If equipped with fuel injection, remove the fuel pump fuse from the fuse panel, operate the engine until it stalls, crank the engine to make sure it will not start.

4. Remove the air cleaner. Label and disconnect the electrical wiring and hoses which may be in the way. Using a shop rag, wrap it around the fuel line and disconnect it.

5. Raise and safely support the vehicle. If equipped, remove the splash pan from under the engine.

NOTE: Be sure to place a clean rag in the throttle body to prevent dirt from entering the engine.

6. To remove the radiator, perform the following procedures:

- a. Drain the engine coolant into a clean container.
- b. Remove the upper and lower radiator hoses.
- c. If equipped with an automatic transmission, disconnect and plug the transmission oil cooler lines from the radiator.
- d. Remove the radiator shroud and the radiator.

7. If equipped with air conditioning, loosen the idler pulley nut and the adjusting bolt, then, remove the compressor and move it aside; do not disconnect the pressure hoses.

8. If equipped with power steering, remove the drive belt and the power steering pump, then, move it aside; do not disconnect the pressure hoses.

Removing the C-clip and pin from the shift lever

9. Disconnect the engine ground cable from the cylinder head. Disconnect the parking brake cable from the brake lever.

10. Disconnect the electrical leads from the starter, alternator, distributor, the high-tension ignition coil cable, the oil pressure and temperature sending units.

11. Disconnect the heater hose from the engine-side, accelerator cable from the throttle body. Disconnect and label the emission hoses or wires to the carbon canister, air pump (if equipped), fuel cut solenoid; the vacuum hose from the power brake booster (if equipped) and any other wires or hoses running to the engine.

12. Raise and safely support the vehicle.

13. If equipped with a manual transmission, lift the rubber shifter boot and remove the shift control linkage from the transmission. If equipped an automatic transmission, disconnect the selector lever from the transmission from under the vehicle.

14. If equipped with a manual transmission, remove the clutch slave cylinder-to-transmission bolts, the cylinder and the exhaust tube.

15. Disconnect the speedometer cable, the back-up light wiring and the neutral switch (if equipped) from the rear section of the transmission.

16. Disconnect the exhaust pipe(s) from the exhaust manifold(s).

17. Using a piece of chalk, make alignment marks on the driveshaft and rear differential flange for realignment purposes. If equipped with a center driveshaft bearing, disconnect the center bearing bracket-to-chassis bolts. Disconnect the driveshaft-to-differential flange, lower and pull the driveshaft from the transmission extension housing (2WD) or transfer case (4WD). Using a clean shop rag, plug the rear end of the transmission or transfer case to prevent fluid loss.

18. If equipped with 4WD, perform the following procedures:

- a. Using a piece of chalk, make alignment marks on the front drive-

View of the engine/transmission mounts - 3.0L engine - Pick-Up and Pathfinder

View of the engine/transmission mounts – 2.4L engine and 2.5L diesel engine – Pick- Up and Pathfinder

shaft-to-transfer case flanges and the front driveshaft-to-differential drive flanges for realignment purposes.

b. Remove the front driveshaft-to-transfer case drive flange bolts and the front driveshaft-to-front differential, then, remove the front driveshaft.

19. Using a vertical lifting hoist, attach it to the engine and lift the engine slightly.

20. If equipped with 4WD, remove the front differential rear mounting bolts, the front differential carrier mounting bolt and the differential crossmember-to-chassis bolts and the crossmember from the vehicle.

21. Remove the front engine mount bracket-to-engine mount bolts (left side) and the engine mount-to-chassis bolts (right-side). Remove the transmission mount-to-crossemember bolts.

22. Using a vertical hoist, take the engine/transmission assembly weight off the engine supports and the rear crossmember.

23. Remove the transmission cross-member-to-chassis bolts and the crossmember.

24. Pull the engine/transmission assembly forward, then, carefully raise and remove it from the vehicle. If necessary, separate the transmission from the engine, then, attach the engine to a work stand.

NOTE: When raising the engine/transmission assembly, be especially careful not to bump it against adjacent parts.

25. To install, reverse the removal procedures. Do not connect any parts to the engine or transmission until the engine and transmission are in place on the engine/transmission mounts and secured by the mounting bolts. Secure the rear support 1st, then, the front engine mounts, using the upper bolt hole as a guide. Refill the cooling system, the automatic transmission with Dexron®II. Adjust the accelerator cable. Start the engine, allow it to reach normal operating temperatures and check for leaks.

Van

1. Disconnect the negative battery cable.

2. Remove the fuel pump fuse from the fuse panel, operate the engine until it stalls, crank the engine to make sure it will not start.

3. Remove the air cleaner. Label and disconnect the electrical wiring and hoses which may be in the way. Using a shop rag, wrap it around the fuel line and disconnect it. If equipped, remove the splash pan from under the engine.

NOTE: Be sure to place a clean rag in the throttle body to prevent dirt from entering the engine.

4. Drain the engine coolant into a clean container. Remove the upper and lower radiator hoses. If equipped with an automatic transmission, disconnect and plug the transmission oil cooler lines from the radiator.

5. If equipped with air conditioning, loosen the idler pulley nut and the adjusting bolt, then, remove the compressor and move it aside; do not disconnect the pressure hoses.

6. If equipped with power steering, remove the drive belt and the power steering pump, then, move it aside; do not disconnect the pressure hoses.

7. Disconnect the engine ground cable from the cylinder head. Disconnect the parking brake cable from the brake lever.

8. Disconnect the electrical leads from the starter, alternator, distributor, the high-tension ignition coil cable, the oil pressure and temperature sending units.

9. Disconnect the heater hose from the engine-side and the accelerator cable from the throttle body. Disconnect and label the emission hoses or wires to the carbon canister, fuel cut solenoid; the vacuum hose from the power brake booster (if equipped) and any other wires or hoses running to the engine.

10. If equipped with a manual transmission, remove the shift control linkage from the transmission. If equipped an automatic transmission, disconnect

View of the engine/transmission mounts—2.4L engine—Van

the selector lever from the transmission from under the vehicle.

11. Raise and safely support the vehicle.

12. If equipped with a manual transmission, remove the clutch slave cylinder-to-transmission bolts and the cylinder.

13. Disconnect the speedometer cable, the back-up light wiring and the neutral switch (if equipped) from the rear section of the transmission.

14. Disconnect the exhaust pipe(s) from the exhaust manifold(s).

15. Using a piece of chalk, make alignment marks on the driveshaft and differential flange for realignment purposes. Disconnect the driveshaft-

to-differential flange, lower and pull the driveshaft from the transmission extension housing. Using a clean shop rag, plug the rear end of the transmission to prevent fluid loss.

16. Using an under the vehicle engine hoist, attach it to the engine/transmission assembly and raise the assembly slightly.

17. Remove the front engine bracket-to-engine mount nuts, the engine mount-to-center member bolts, the center member-to-chassis bolts and the center member from the vehicle. Remove the transmission-to-rear support bracket nut/bolt.

18. Using an under the vehicle lift, lower the engine from the vehicle.

NOTE: It may be necessary to raise the vehicle to provide clearance to slide the engine/transmission from under the vehicle.

19. If necessary, separate the transmission from the engine, then, attach the engine to a work stand.

NOTE: When removing the engine/transmission assembly, be especially careful not to bump it against adjacent parts.

To install:

20. Reverse the removal procedures.

21. Do not connect any parts to the engine or transmission until the engine and transmission are in place on the engine/transmission mounts and secured by the mounting bolts.

22. Secure the rear support 1st, then, the front engine mounts, using the upper bolt hole as a guide.

23. Refill the cooling system, the automatic transmission with Dexron®II. Adjust the accelerator cable.

24. Start the engine, allow it to reach normal operating temperatures and check for leaks.

Axxess

1. Relieve the fuel pressure. Disconnect the negative battery cable.

2. Raise and safely support the vehicle.

3. Drain the cooling system. Remove the upper and lower radiator hoses.

4. Disconnect the plug the fuel lines from the fuel pressure regulator.

5. Label and disconnect the electrical connectors and the hoses. Remove the accelerator cable from the throttle body.

6. Loosen the alternator, the power steering and the air conditioning compressor pivot bolts and remove the drive belts.

7. Disconnect the electrical connectors from the alternator and remove the alternator.

8. Remove the power steering pump

3.90-3.98 IN. (99-101MM)

Adjusting the buffer rod length - Axxess 4WD

mounting bolts and move the pump aside; do not disconnect the pressure lines.

9. Remove the air conditioning compressor-to-engine bolts and move the compressor aside; do not disconnect the air conditioning coolant lines.

10. If equipped with a manual transaxle, remove the clutch slave cylinder-to-transaxle bolts and move the cylinder aside. Disconnect the shift control rod from the transaxle.

11. Raise and safely support the vehicle.

12. If equipped with an automatic transaxle, remove the shift control cable and the throttle wire from the transaxle. Disconnect and plug the oil cooler lines from the radiator.

13. If equipped with 4WD, remove the driveshaft from the transfer case.

14. Remove the front wheels and separate the halfshafts from the transaxle.

15. Remove the exhaust pipe-to-exhaust manifold bolts, the exhaust pipe-to-converter bolts and the pipe from the vehicle.

16. Using an engine lift, connect it to the engine slingers and lift it slightly.

17. Remove the engine/transaxle assembly-to-chassis mounts.

18. Position a movable stand under the engine/transaxle assembly and lower the assembly onto the stand.

19. Remove the engine/transaxle assembly from the vehicle.

20. Remove the transaxle-to-engine bolts and separate the transaxle from the engine.

21. To install, reverse the removal procedures.

22. If equipped with a 4WD, adjust the length between the buffer rod bolts.

23. Refill the cooling system and the automatic transaxle, if equipped. Start the engine, allow it to reach normal operating temperatures and check for leaks.

Cylinder Head

REMOVAL & INSTALLATION

Pick-Up, Pathfinder and Van

2.4L ENGINE

1. Relieve the fuel pressure. Disconnect the negative battery cable.

2. Remove the air cleaner. Disconnect the accelerator cable from the throttle body.

3. Place a clean drain pan under the radiator and drain the engine coolant.

4. Disconnect and plug the fuel lines. Remove the intake and exhaust manifolds.

5. If equipped with power steering, disconnect the drive belt, then, remove the power steering pump and move it aside; do not disconnect the pressure hoses.

6. Remove the valve cover-to-engine bolts and the valve cover.

7. Label and disconnect the spark plug wires from the spark plugs. Remove the spark plugs to protect them from damage.

8. On the 1990 engines, remove the fuel rail and the injectors.

9. Rotate the crankshaft until the No. 1 cylinder is on the TDC of its compression stroke.

10. Using paint or chalk, mark the camshaft sprocket-to-timing chain relationship; if this is done, it will not be necessary to locate the factory timing marks.

NOTE: If the timing chain is equipped with silver links, be sure to align the camshaft timing mark with the silver link.

11. Remove the camshaft sprocket-to-camshaft bolt and the camshaft sprocket. Using the timing chain tool, wedge and support the timing chain; this will be necessary to keep the chain from falling into the front cover.

12. Remove the cylinder head-to-engine bolts and the cylinder head; be sure to remove the cylinder head-to-front cover bolts. It may be necessary to tap the head lightly with a copper or brass mallet to loosen it.

13. Clean the gasket mounting surfaces. Inspect the cylinder head for warpage; the difference must be less than 0.0059 in.

To install:

14. To install the cylinder head, use a new gasket and torque the cylinder head-to-engine bolts, in sequence, using 5 steps:

1st - 22 ft. lbs. (29 Nm)

2nd - 58 ft. lbs. (78 Nm)

3rd - loosen all bolts

4th - 22 ft. lbs. (29 Nm)

5th - 54-61 ft. lbs. (74-83 Nm)

15. Install the camshaft sprocket together with the timing chain to the camshaft; make sure the timing marks are aligned. Torque the camshaft sprocket-to-camshaft bolt to 87-116 ft. lbs.

16. To complete the installation, reverse the removal procedures. It is always wise to drain the crankcase oil after the cylinder head has been in-

stalled to avoid coolant contamination. Start the engine and allow it to reach normal operating temperatures, then, check for leaks.

Cylinder head bolt loosening sequence—2.4L engine

Cylinder head bolt torquing sequence—2.4L engine 1986-89

3.0L ENGINE—LEFT SIDE

1. Disconnect the negative battery cable.
2. Remove the timing belt, the left exhaust manifold and the intake manifold.

NOTE: Before removing the timing belt, be sure to mark the position of the timing belt-to-camshaft sprockets and the timing belt-to-crankshaft sprocket, then, place an arrow on the timing belt in the direction of rotation. Do not rotate the crankshaft after the timing belt has been removed.

3. Remove the camshaft sprocket-to-camshaft bolt and the camshaft sprocket, then, remove the rear timing belt cover-to-cylinder head bolts.
4. Remove the distributor cap, then, using a piece of chalk, align the rotor-to-distributor housing and the distributor housing-to-cylinder head. Remove the distributor-to-cylinder head bolt and the distributor.
5. Remove the valve cover from the left cylinder head.

NOTE: It may be necessary to remove the valve lifter guide-to-cylinder head bolts and the valve lifter guide to provide access to the cylinder head bolts. When removing the valve lifter guide, be sure to secure the valve lifters with a safety wire, to keep them in their original positions.

5. Remove the cylinder head-to-engine bolts and the cylinder head.

7. Clean the gasket mounting surfaces. Using a small power wire brush, clean the carbon from the piston depressions in the cylinder head.

8. Inspect the cylinder head for cracks and other flaws. Using a straight-edge and a feeler gauge, measure the cylinder head warpage. If the warpage exceeds 0.004 in. or there is other damage, repair or replace the cylinder head.

NOTE: If the cylinder head warpage is significant, requiring the head to be machined, submit it to a reputable automotive machine shop; be sure the cylinder head is disassembled before submitting it to a machine shop.

To install:

9. Use a new gasket and reverse the removal procedures. Torque as follows:

Cylinder head-to-engine bolts (in sequence) in five steps

- 1st—22 ft. lbs.
- 2nd—43 ft. lbs.
- 3rd—loosen all bolts
- 4th—22 ft. lbs.
- 5th—40-47 ft. lbs.

10. To complete the installation, use new gaskets and reverse the removal procedures. Torque as follows

Valve lifter guide-to-cylinder head bolts—13-16 ft. lbs.

Valve cover-to-cylinder head bolts—9-25 inch lbs.

Exhaust manifold-to-cylinder head nuts—13-16 ft. lbs.

Intake manifold-to-cylinder head nuts—17-20 ft. lbs. or bolts to 12-14 ft. lbs.

Camshaft sprocket-to-camshaft nut—58-65 ft. lbs.

11. Refill the cooling system. Start the engine, allow it to reach normal operating temperatures and check for leaks.

3.0L ENGINE—RIGHT SIDE

1. Disconnect the negative battery cable.

2. Remove the timing belt, the right exhaust manifold and the intake manifold.

NOTE: Before removing the timing belt, be sure to mark the position of the timing belt-to-camshaft sprockets and the timing belt-to-crankshaft sprocket, then, place an arrow on the timing belt in the direction of rotation. Do not rotate the crankshaft after the timing belt has been removed.

3. Remove the camshaft sprocket-to-camshaft bolt and the camshaft

Exploded view of the cylinder head assembly—3.0L engine

View of the cylinder head torquing sequence—3.0L engine

Aligning the crankshaft sprocket marks—3.0L engine

sprocket, then, remove the rear timing belt cover-to-cylinder head bolts.

4. Remove the valve cover from the right cylinder head.

NOTE: It may be necessary to remove the valve lifter guide-to-cylinder head bolts and the valve lifter guide to provide access to the cylinder head bolts. When removing the valve lifter guide, be sure to secure the valve lifters with a safety wire, to keep them in their original positions.

CYLINDER HEAD BOLT WASHER

CYLINDER HEAD SIDE

faces. Using a small power wire brush, clean the carbon from the piston depressions in the cylinder head.

7. Inspect the cylinder head for cracks and other flaws. Using a straight-edge and a feeler gauge, measure the cylinder head warpage. If the warpage exceeds 0.004 in. or there is other damage, repair or replace the cylinder head.

NOTE: If the cylinder head warpage is significant, requiring the head to be machined, submit it to a reputable automotive machine shop; be sure the cylinder head is disassembled before submitting it to a machine shop.

To install:

8. Use a new gasket and reverse the removal procedures. Torque as follows:

Cylinder head-to-engine bolts (in sequence) in five steps

- 1st—22 ft. lbs.
- 2nd—43 ft. lbs.
- 3rd—loosen all bolts
- 4th—22 ft. lbs.
- 5th—40–47 ft. lbs.

9. To complete the installation, use new gaskets and reverse the removal procedures. Torque as follows:

Valve lifter guide-to-cylinder head bolts—13–16 ft. lbs.

Valve cover-to-cylinder head bolts—9–25 inch lbs.

Exhaust manifold-to-cylinder head nuts—13–16 ft. lbs.

Intake manifold-to-cylinder head nuts—17–20 ft. lbs. or bolts to 12–14 ft. lbs.

Camshaft sprocket-to-camshaft nut—58–65 ft. lbs.

10. Refill the cooling system. Start the engine, allow it to reach normal operating temperatures and check for leaks.

Axxess

2.4L ENGINE

1. Relieve the fuel pressure. Disconnect the negative battery cable.

2. Remove the intake and exhaust manifolds.

3. Place a clean drain pan under the radiator and drain the engine coolant.

4. Disconnect and plug the fuel lines.

5. Disconnect the electrical connectors from the distributor and remove the distributor cap.

6. Remove the intake and exhaust manifolds.

7. If equipped with power steering, disconnect the drive belt, then, remove the power steering pump and move it aside; do not disconnect the pressure hoses.

8. Remove the valve cover-to-engine bolts and the valve cover.

9. Label and disconnect the spark plug wires from the spark plugs. Remove the spark plugs to protect them from damage.

10. Remove the fuel rail and the injectors.

11. Rotate the crankshaft until the No. 1 cylinder is on the TDC of its compression stroke.

12. Using paint or chalk, mark the camshaft sprocket-to-timing chain relationship; if this is done, it will not be necessary to locate the factory timing marks.

NOTE: If the timing chain is equipped with silver links, be sure to align the camshaft timing mark with the silver link.

13. Remove the camshaft sprocket-to-camshaft bolt and the camshaft sprocket. Using the timing chain tool, wedge and support the timing chain; this will be necessary to keep the chain from falling into the front cover.

14. Remove the cylinder head-to-engine bolts and the cylinder head; be sure to remove the cylinder head-to-front cover bolts. It may be necessary to tap the head lightly with a copper or brass mallet to loosen it.

15. Clean the gasket mounting surfaces. Inspect the cylinder head for

Cylinder head bolt torquing sequence—2.4L engine 1990

warpage; the difference must be less than 0.0059 in.

To install:

16. To install the cylinder head, use a new gasket and torque the cylinder head-to-engine bolts, in sequence, using 5 steps:

- 1st—22 ft. lbs. (29 Nm)
- 2nd—58 ft. lbs. (78 Nm)
- 3rd—loosen all bolts
- 4th—22 ft. lbs. (29 Nm)
- 5th—54–61 ft. lbs. (74–83 Nm)

17. Install the camshaft sprocket together with the timing chain to the camshaft; make sure the timing marks are aligned. Torque the camshaft sprocket-to-camshaft bolt to 87–116 ft. lbs.

18. To complete the installation, reverse the removal procedures. It is always wise to drain the crankcase oil after the cylinder head has been installed to avoid coolant contamination. Start the engine and allow it to reach normal operating temperatures, then, check for leaks.

ADJUSTMENT

2.4L Engine (1986-89)

NOTE: Adjustment should be made with the engine hot.

1. Operate the engine until normal operating temperatures are reached, then, turn **OFF** the engine.

2. Disconnect the negative battery cable. Remove the valve cover.

3. Using a socket wrench on the crankshaft pulley bolt, rotate the crankshaft until the No. 1 cylinder is on the TDC of the compression stroke.

NOTE: To check for the No. 1 TDC position, remove the No. 1 spark plug, place a thumb over the hole, rotate the crankshaft until the compression pressure can be felt in the cylinder.

4. Using a wrench, flat-bladed tool and a feeler gauge, check and/or adjust the valves No. 1, 2, 4 and 6.

5. Rotate the crankshaft 180 degrees to position the No. 4 cylinder on the TDC of its compression stroke.

6. With the No. 4 cylinder at the TDC of its compression stroke, adjust the valves No. 3, 5, 7 and 8.

7. Clean the gasket mounting surfaces.

8. After adjustment, use new gaskets, sealant (if necessary) and reverse the removal procedures. Torque the locknut to 12–16 ft. lbs.

Rocker Arms/Shafts

REMOVAL & INSTALLATION

2.4L Engine

1. Disconnect the negative battery cable.

2. Disconnect any hoses and wires which may interfere with the removal of the valve cover.

3. Remove the valve cover-to-cylinder head bolts and the valve cover.

4. Remove the rocker arm/shaft assembly-to-cylinder head bolts.

NOTE: When removing the rocker/arm shaft bolts, do not remove the No. 1 and No. 5 bracket bolts from the rocker arm bracket or the rocker bracket will spring from the rocker shaft.

5. If separating the rocker arms from the rocker arm shafts, be sure to keep them in order for reinstallation purposes.

6. Clean the gasket mounting surfaces.

NOTE: Be aware that the rocker arm shafts are different in construction and must be installed in their original positions.

7. To install, use new gaskets, sealant, if necessary and reverse the removal procedures. Torque the rocker arm/shaft assembly-to-cylinder head bolts to 11–18 ft. lbs. Adjust the valve clearances on the 1986–89 engines.

3. Remove the valve cover-to-cylinder head bolts and the valve cover.

4. Remove the rocker arm/shaft assemblies-to-cylinder head bolts and the rocker arm/shaft assemblies; if necessary, separate the rocker arms from the rocker arm shaft.

NOTE: If separating the rocker arms from the rocker arm shaft, be sure to keep them in order for reinstallation purposes.

5. Clean the gasket mounting surfaces.

NOTE: Be aware that the rocker arm shafts are different in construction and must be install in their original positions.

6. To install, use new gaskets, sealant, if necessary and reverse the removal procedures. Torque the rocker arm shaft-to-cylinder head bolts to 13–16 ft. lbs. and the valve cover-to-cylinder head bolts to 9–25 inch lbs.

Intake Manifold

REMOVAL & INSTALLATION

2.4L Engine

EXCEPT 1990 AXXESS

1. Release the fuel pressure. Disconnect the negative battery cable.

2. Remove the air cleaner assembly together with all of the attending hoses. Remove the EGR tube.

3. Label and disconnect the electrical wiring and hoses which may be in the way. Using a shop rag, wrap it around the fuel line and disconnect it.

4. Drain the engine coolant to a level below the thermostat housing, then, disconnect the upper coolant hose from the thermostat housing.

5. Disconnect the throttle linkage and vacuum lines from the throttle body.

NOTE: The throttle body can be removed from the manifold at this point or it can be removed as an assembly with the intake manifold.

6. Remove the throttle body-to-intake manifold nuts, the throttle body and the heater mixture.

7. On the 1990 model, remove the fuel rail with the injectors and the intake manifold stays.

8. Remove the intake manifold-to-engine bolts and the intake manifold.

9. Clean the gasket mounting surfaces.

10. To install, use a new gaskets and reverse the removal procedures. Torque the intake manifold-to-engine bolts (working from the center in an outwards direction—using 2 progres-

sive steps) to 12–15 ft. lbs. (16–21 Nm) and the throttle body-to-intake manifold nuts 9–13 ft. lbs. (12–18 Nm). Refill the cooling system. Start the engine, allow it to reach normal operating temperatures and check for leaks.

1990 AXXESS

1. Release the fuel pressure. Disconnect the negative battery cable.

2. Remove the air duct from the throttle body. Remove the EGR tube.

3. Label and disconnect the electrical wiring and hoses which may be in the way. Using a shop rag, wrap it around the fuel line and disconnect it.

4. Drain the engine coolant to a level below the thermostat housing, then,

disconnect the upper coolant hose from the thermostat housing.

5. Disconnect the throttle linkage and vacuum lines from the throttle body.

6. Remove the throttle body-to-intake manifold collector bolts and the throttle body.

7. Remove the intake manifold stays.

8. Remove the fuel rail with the injectors.

9. Remove the intake manifold collector-to-intake manifold, the collector and the gasket.

10. Remove the intake manifold-to-engine bolts and the intake manifold.

11. Clean the gasket mounting surfaces.

Exploded view of the Intake manifold assembly—2.4L engine 1990—Axxess

12. To install, use a new gaskets and reverse the removal procedures. Torque the intake manifold-to-engine bolts (working from the center in an outwards direction—using 2 progressive steps) to 12-15 ft. lbs. (16-21 Nm), the intake manifold collector-to-intake manifold bolts to 12-15 ft. lbs. (16-21 Nm) and the throttle body-to-intake manifold collector bolts, using 2 passes, to 13-16 ft. lbs. (18-22 Nm). Refill the cooling system. Start the engine, allow it to reach normal operating temperatures and check for leaks.

Exploded view of the Intake manifold assembly—3.0L engine 1986-89

3.0L Engine

1986-89—ALL VEHICLES

1. Remove the fuel pump fuse from the fuse block.
2. Start the engine and allow it to run until it stalls. After it has stalled, crank it 2-3 times, then, turn **OFF** the ignition switch and reinstall the fuel pump fuse.
3. Disconnect the negative battery cable. Drain the cooling system to a level below the intake manifold.
4. Remove the air cleaner. Disconnect the accelerator linkage from the throttle body.

5. Remove the upper radiator hose from the water outlet housing and the exhaust tube from the EGR valve. If necessary, remove the EGR valve-to-intake manifold nuts and the EGR valve.
6. Using a shop rag, wrap it around the fuel line and disconnect it from the throttle body. Remove the throttle body-to-intake manifold nuts, the throttle body and the heater mixture assembly.
7. Remove the intake manifold-to-engine bolts and the intake manifold.

View of the Intake manifold torquing sequence—3.0L engine 1986-89

8. Clean the gasket mounting surfaces.

To install:

9. Use new gaskets and reverse the removal procedures. Torque as follows:

Intake manifold-to-engine bolts—12–14 ft. lbs.

Intake manifold-to-engine nuts—17–20 ft. lbs.

EGR valve-to-intake manifold nuts—13–17 ft. lbs.

Throttle body-to-intake manifold nuts—9–13 ft. lbs.

10. Refill the cooling system. Start the engine, allow it to reach normal operating temperatures and check for leaks.

1990—ALL VEHICLES

1. Release the fuel pressure.

2. Disconnect the negative battery cable. Drain the cooling system to a level below the intake manifold.

3. Remove the air duct from the throttle body. Disconnect the accelerator linkage from the throttle body.

4. Remove the upper radiator hose from the water outlet housing and the exhaust tube from the EGR valve. If necessary, remove the EGR valve-to-intake manifold nuts and the EGR valve.

5. Using a shop rag, wrap it around

the fuel line and disconnect it from the fuel rail. Remove the throttle body-to-intake manifold collector bolts and the throttle body.

6. Remove the intake manifold collector-to-intake manifold bolts and the collector.

7. Remove the fuel rail, with the injectors, from the intake manifold.

8. Remove the intake manifold-to-engine bolts and the intake manifold.

9. Clean the gasket mounting surfaces.

To install:

10. Install the intake manifold by performing the following procedures:

a. Use new gaskets and position the intake manifold onto the engine.

b. Torque the intake manifold-to-engine nuts and bolts, in sequence, to 2.2–3.6 ft. lbs. (3–5 Nm).

c. Torque the intake manifold-to-

engine bolts, in sequence, to 12–14 ft. lbs. (16–20 Nm) and the nuts, in sequence, to 17–20 ft. lbs. (24–27 Nm).

d. Torque the intake manifold-to-engine bolts, in sequence, to 12–14 ft. lbs. (16–20 Nm) and the nuts, in sequence, to 17–20 ft. lbs. (24–27 Nm).

11. Use a new gasket and torque the intake manifold collector-to-intake manifold bolts to 13–16 ft. lbs. (18–22 Nm).

12. Use a new gasket and torque the throttle body-to-intake manifold collector bolts, in 2 steps, to 13–15 ft. lbs. (18–22 Nm).

13. Refill the cooling system. Start the engine, allow it to reach normal operating temperatures and check for leaks.

Exhaust Manifold

REMOVAL & INSTALLATION

2.4L Engine

1. Disconnect the negative battery cable.

2. If equipped, remove the hot air duct from the exhaust manifold cover.

3. Disconnect the spark plug wires from the left side of the engine; if nec-

essary, remove the spark plugs from the left side of the engine.

4. If necessary, raise and safely support the vehicle.

5. If equipped, remove the air induction tubes from the exhaust manifold. Remove the EGR tube from the exhaust manifold.

6. Remove the hot air cover and the exhaust pipe from the exhaust manifold.

7. Remove the exhaust manifold-to-engine nuts and the manifold from the engine.

8. Clean the gasket mounting surfaces.

9. To install, use new gaskets and reverse the removal procedures. Torque the exhaust manifold-to-cylinder head nuts/bolts to 12-15 ft. lbs. (working from the center to the ends) in 2 progressive steps.

3.0L Engine

LEFT SIDE

1. Disconnect the negative battery cable.

2. Remove the hot air tube from the exhaust manifold cover. Remove the exhaust manifold cover-to-exhaust manifold bolts and cover.

3. Remove the EGR and the AIR tubes from the exhaust manifold.

NOTE: If the alternator is in the way, remove the drive belt and the alternator.

4. Raise and safely support the vehicle.

5. Remove the exhaust pipe-to-exhaust manifold nuts and separate the exhaust pipe from the manifold.

6. Remove the exhaust manifold-to-cylinder head bolts and the manifold from the engine.

7. Clean the gasket mounting surfaces.

8. To install, use new gaskets and reverse the removal procedures. Torque the exhaust manifold-to-cylinder head nuts to 13-16 ft. lbs. and the exhaust pipe-to-exhaust manifold bolts to 16-20 ft. lbs.

RIGHT SIDE

1. Disconnect the negative battery cable.

2. Remove the upper/lower exhaust manifold cover-to-exhaust manifold bolts and covers.

3. Remove the AIR tube from the exhaust manifold.

4. Raise and safely support the vehicle.

5. Remove the exhaust pipe-to-exhaust manifold bolts and separate the exhaust pipe from the manifold.

6. Remove the exhaust manifold-to-cylinder head bolts and the manifold from the engine.

Exploded view of the exhaust manifold assembly—2.4L engine 1990

View of the torquing sequence of the exhaust manifolds—3.0L engine

7. Clean the gasket mounting surfaces.

8. To install, use new gaskets and reverse the removal procedures. Torque the exhaust manifold-to-cylinder head nuts to 13-16 ft. lbs. and the exhaust pipe-to-exhaust manifold bolts to 16-20 ft. lbs.

Timing Chain Front Cover

REMOVAL & INSTALLATION

2.4L Engine

EXCEPT AXCESS

1. Disconnect the negative battery cable. Drain the cooling system. Remove the upper and lower coolant hoses

from the engine, then, the radiator.

2. Loosen the alternator adjusting bolt and remove the drive belt. Remove the alternator bracket-to-engine bolts and move the alternator aside.

3. If equipped with air conditioning, remove the drive belt. If necessary, remove the air conditioning bracket-to-engine bolts, then, move the air conditioning compressor and bracket.

4. If equipped with power steering, remove the drive belt.

5. Rotate the crankshaft to position the No. 1 cylinder on TDC of its compression stroke.

6. Remove the distributor cap. Matchmark the rotor to the distributor housing and the distributor housing to the timing chain cover. Remove the distributor hold-down bolt and the distributor.

7. Remove the oil pump-to-timing cover bolts, the oil pump and its drive spindle.

8. Remove the cooling fan-to-water pump bolts, the fan, the fan coupling, if equipped and the water pump pulley.

9. Remove the crankshaft pulley-to-crankshaft bolt and the crankshaft pulley.

10. Remove the timing chain cover-to-cylinder head bolts, the timing chain cover-to-engine bolts, the timing chain cover-to-oil pan bolts and the cover.

11. Cut the exposed timing cover-to-oil pan gasket from the oil pan gasket.

12. Clean the gasket mounting surfaces.

To install:

NOTE: Whenever the timing cover is removed, replace the oil seal.

13. To install, use new gaskets, sealant, if necessary and reverse the removal procedures. Cut the portions needed from a new oil pan gasket and top front cover gasket.

NOTE: Before installing the oil pump, place the gasket over the shaft and make sure the drive spindle mark (faces) aligns with the oil pump hole.

14. Apply a light coating of oil to the crankshaft oil seal and carefully mount the timing cover to the front of the engine and install all of the mounting bolts. Torque as follows:

Timing cover-to-engine bolts
8mm bolts—7-12 ft. lbs. (10-16 Nm)

6mm bolts—3-7 ft. lbs. (4-10 Nm)
Oil pan-to-timing cover bolts—4-6 ft. lbs. (6-8 Nm)

Oil pump-to-timing cover bolts—8-11 ft. lbs. (11-15 Nm)

Exploded view of the timing chain assembly—2.4L engine 1986-89—except Axxess

Exploded view of the timing chain assembly—2.4L engine 1990—except Axxess

Crankshaft pulley bolt—87-116 ft. lbs. (118-157 Nm).

15. Refill the cooling system. Check and/or adjust the ignition timing.

AXXESS

1. Disconnect the negative battery cable. Drain the cooling system. Remove the upper and lower coolant hoses from the engine, then, the radiator.

2. Loosen the alternator adjusting bolt and remove the drive belt. Remove the alternator bracket-to-engine bolts and move the alternator aside.

3. If equipped with air conditioning, remove the drive belt. If necessary, remove the air conditioning bracket-to-engine bolts, then, move the air conditioning compressor and bracket.

4. If equipped with power steering, remove the drive belt.

5. Rotate the crankshaft to position the No. 1 cylinder on TDC of it's compression stroke.

6. Raise and safely support the vehicle. Drain the crankcase.

7. Remove the oil pan-to-engine bolts and the oil pan. Remove the oil pump pickup tube-to-timing chain cover bolts.

8. Remove the cooling fan-to-water pump bolts, the fan, the fan coupling, if equipped and the water pump pulley.

9. Remove the crankshaft pulley-to-crankshaft bolt and the crankshaft pulley.

10. Remove the timing chain cover-to-cylinder head bolts, the timing chain cover-to-engine bolts and the timing chain cover.

11. Cut the exposed timing cover-to-oil pan gasket from the oil pan gasket.

12. Clean the gasket mounting surfaces.

To install:

NOTE: Whenever the timing cover is removed, replace the oil seal.

13. To install, use new gaskets, sealant, if necessary and reverse the removal procedures. Cut the portions needed from a new oil pan gasket and top front cover gasket.

14. Apply a light coating of oil to the crankshaft oil seal and carefully mount the timing cover to the front of the engine and install all of the mounting bolts. Torque as follows:

Timing cover-to-engine bolts;
8mm bolts—12-15 ft. lbs. (16-21 Nm)

6mm bolts—5-6 ft. lbs. (7-8 Nm)

Oil pump pickup tube-to-timing cover bolts—12-15 ft. lbs. (16-21 Nm)

Crankshaft pulley bolt—87-116 ft. lbs. (118-157 Nm).

15. Refill the cooling system. Check and/or adjust the ignition timing.

Exploded view of the timing chain assembly—2.4L engine 1990—Axxess

View of the timing chain and sprocket matchmarks—2.4L engine 1986-89

View of the timing chain and sprocket matchmarks—2.4L engine 1990

cracked links, wear and/or damage; if necessary, replace the chain.

6. Clean the gasket mounting surfaces.

NOTE: Whenever the timing cover is removed, it is a good idea to replace the oil seal.

7. To install, use new gaskets, sealant, if necessary and reverse the removal procedures. Cut the portions needed from a new oil pan gasket and top front cover gasket.

NOTE: If equipped with an exterior oil pump, place the gasket over the shaft and make sure the

Front Cover Oil Seal

REPLACEMENT

2.4L Engine

1. Disconnect the negative battery cable.
2. Remove the crankshaft pulley.
3. Using a small pry bar, pry the front oil seal from the timing cover.
4. Using an oil seal Installation tool, oil the lips of the new seal and drive the new oil seal into the timing cover until it seats.
5. To complete the installation, reverse the removal procedures. Torque the crankshaft pulley-to-crankshaft bolt to 87-116 ft. lbs. (118-157 Nm). Refill the cooling system. Start the engine, allow it reach normal operating temperatures and check for leaks.

Timing Chain and Sprockets

REMOVAL & INSTALLATION

2.4L Engine

NOTE: Before attempting this

procedure, rotate the crankshaft to position the No. 1 piston on the TDC of its compression stroke.

1. Disconnect the negative battery cable. Drain the cooling system.
2. Remove the timing chain cover.
3. Remove the valve cover-to-cylinder head bolts and the valve cover.

NOTE: With the No. 1 piston at TDC of its compression stroke, the timing marks on the camshaft sprocket and crankshaft sprocket should align with the silver links, if equipped of the timing chain; if no silver marks, paint alignment marks on the chain.

4. Remove the camshaft sprocket-to-camshaft bolt and the sprocket along with the chain.

NOTE: When removing the timing chain, hold it where the chain tensioner contacts it. When the chain is removed, the tensioner will come apart. Hold on to it and don't lose any the parts. There is no need to remove the chain guide unless it is being replaced.

5. Inspect the timing chain for

drive spindle mark (faces) aligns with the oil pump hole.

8. Apply a light coating of oil to the crankshaft oil seal and carefully mount the timing cover to the front of the engine and install all of the mounting bolts.

9. Refill the cooling system and the crankcase on the Axxess. Check and/or adjust the ignition timing.

Timing Belt Front Cover

REMOVAL & INSTALLATION

3.0L Engine

1. Disconnect the negative battery cable.

2. Remove the radiator shroud, the fan-to-water pump bolts and the fan.

3. Loosen and remove the alternator, the power steering, if equipped, the air conditioning, if equipped and the drive belts.

4. Raise and safely support the vehicle.

5. Remove the upper/lower timing belt covers-to-engine to engine bolts and the covers.

6. To install, reverse the removal procedures. Torque the timing cover-to-engine bolts to 26–42 inch lbs.

OIL SEAL REPLACEMENT

3.0L Engine

The front oil seal is a part of the oil pump.

1. Remove the oil pump.

2. Using a medium size pry bar, pry the oil seal from the oil pump.

3. Using an oil seal installation tool, lubricate the oil seal lips and drive the new oil seal into the oil pump.

4. To complete the installation, use new gaskets and reverse the removal procedures. Refill the crankcase with new oil and the cooling system with antifreeze.

Timing Belt and Tensioner

ADJUSTMENT

3.0L Engine

1986-87

1. Disconnect the negative battery cable.

2. Raise and safely support the vehicle.

3. Remove the upper and lower timing belt covers.

4. Using a hexagon wrench, loosen the tensioner lock bolt, set the tension-

er and slowly turn the tensioner clockwise and counterclockwise 2–3 times.

NOTE: If the coarse tensioner stud has been removed, be sure to apply locking sealer to the threads before installing it.

5. Tighten the tensioner locknut to 32–43 ft. lbs. (43–58 Nm). Tighten the rocker arm shaft retaining bolts (in 2–3 stages) to 13–16 ft. lbs. (18–22 Nm).

NOTE: Before tightening, be sure to set the camshaft lobe at the position where the lobe is not lifted.

6. Install the upper and lower timing belt covers.

7. To complete the installation, reverse the removal procedures.

1988-90

1. Disconnect the negative battery cable.

2. Raise and safely support the vehicle.

3. Remove the upper and lower timing belt covers.

4. While keeping the tensioner steady, loosen the locknut with a hexagon wrench.

5. Turn the tensioner approximately 70–80 degrees clockwise with the wrench and tighten the locknut.

6. Turn the crankshaft clockwise several times and slowly set the No. 1 piston to TDC of the compression stroke.

7. Apply 22 lbs. of pressure (push it

in) to the center span of the timing belt between the right side camshaft sprocket and the tensioner pulley and loosen the tensioner locknut.

8. Using a 0.0138 in. (0.35mm) feeler gauge (the actual width of the blade must be 1/2 in.), slowly turn the crankshaft clockwise. The timing belt should move approximately 2 1/2 teeth. Tighten the tensioner locknut, turn the crankshaft slightly and remove the feeler gauge.

9. Slowly, rotate the crankshaft clockwise several times and set the No. 1 piston to the TDC of its compression stroke.

10. Install the upper and lower timing belt covers.

11. To complete the installation, reverse the removal procedures.

REMOVAL & INSTALLATION

3.0L Engine

1. Disconnect the negative battery cable.

2. Raise and safely support the vehicle.

3. Place a clean drain pan under the radiator and drain the engine coolant into the pan.

4. Remove the radiator shroud, the fan-to-water pump bolts and the fan.

5. Remove the upper/lower coolant hoses and the radiator.

6. Loosen and remove the alternator, the power steering, if equipped, the air conditioning, if equipped and the drive belts.

Checking the timing belt tension—3.0L engine 1988-90

Positioning the feeler gauge—3.0L engine 1988-90

View of the timing belt and sprocket alignment marks—3.0L engine

Adjusting the tensioner pulley—3.0L engine

7. Using a socket wrench on the crankshaft bolt, rotate the crankshaft to position the No. 1 piston on the TDC of its compression stroke.

NOTE: Make sure the sprocket alignment marks are aligned with rear timing plate and the oil pump housing.

8. Remove the upper/lower timing belt covers-to-engine bolts and the covers.

9. Using a piece of chalk or paint, mark the camshaft sprocket-to-timing belt and crankshaft sprocket-to-timing belt alignment marks; also, mark the direction of timing belt rotation (if reusing the belt).

10. Loosen the timing belt tensioner and remove the return spring. Remove the timing belt from the sprockets.

NOTE: It is good practice to remove and replace the crankshaft oil seal when the crankshaft sprocket is removed.

To install:

11. Clean the gasket mounting surfaces. Inspect the timing belt and the sprockets for cracks, wear and/or damage.

12. To install, align the timing marks, use new gaskets, sealant, if necessary and reverse the removal procedures. Adjust the timing belt tension.

13. Torque the crankshaft sprocket-to-crankshaft bolt to 90–98 ft. lbs. and the timing cover-to-engine bolts to 26–42 inch lbs.

14. Refill the cooling system. Start the engine, allow it to reach normal operating temperatures and check for leaks. Check and or adjust the ignition timing.

Timing Sprockets

REMOVAL & INSTALLATION

3.0L Engine

1. Disconnect the negative battery cable.

2. Place a clean drain pan under the radiator and drain the engine coolant into the pan.

3. Remove the radiator shroud, the fan-to-water pump bolts and the fan.

4. Remove the coolant hoses and the radiator.

5. Loosen and remove the alternator, the power steering, if equipped, the air conditioning, if equipped and the drive belts.

6. Using a socket wrench on the crankshaft bolt, rotate the crankshaft to position the No. 1 piston on the TDC of its compression stroke.

NOTE: Make sure the sprocket alignment marks are aligned with rear timing plate and the oil pump housing.

7. Remove the upper/lower timing belt covers-to-engine bolts and the covers.

8. Using a piece of chalk or paint, mark the camshaft sprocket-to-timing belt and crankshaft sprocket-to-timing belt alignment marks; also, mark

the direction of timing belt rotation (if reusing the belt).

9. Loosen the timing belt tensioner and remove the return spring. Remove the timing belt from the sprockets.

10. Remove the crankshaft sprocket by performing the following procedures:

a. Remove the crankshaft pulley-to-crankshaft bolt.

b. Using a wheel puller tool, press the crankshaft pulley from the crankshaft.

c. Remove the crankshaft pulley plate and the crankshaft sprocket.

NOTE: It is good practice to remove and replace the crankshaft oil seal when the crankshaft sprocket is removed.

11. Remove the camshaft sprocket(s) by performing the following procedures:

a. Remove the valve cover(s)-to-cylinder head bolts and the valve covers.

b. Remove the camshaft sprocket-to-camshaft bolt and the camshaft sprocket.

12. Clean the gasket mounting surfaces. Inspect the timing belt and the sprockets for cracks, wear and/or damage.

13. To install, align the timing marks, use new gaskets, sealant, if necessary and reverse the removal procedures. Torque the camshaft sprocket(s)-to-camshaft bolt(s) to 58–65 ft. lbs., the crankshaft sprocket-to-crankshaft bolt to 90–98 ft. lbs. and adjust the timing belt tension.

14. Torque the timing cover-to-engine bolts to 26–42 inch lbs. Refill the cooling system. Start the engine, allow it to reach normal operating temperatures and check for leaks. Check and or adjust the ignition timing.

Camshaft

REMOVAL & INSTALLATION

2.4L Engine

EXCEPT AXCESS

1. Release the fuel pressure. Disconnect the negative battery cable.

2. Remove the rocker arm cover.

3. Rotate the crankshaft to position the No. 1 cylinder on the TDC of its compression stroke.

4. Remove the timing chain cover and the timing chain from the camshaft sprocket.

5. Remove the rocker arm/shaft assembly-to-cylinder head bolts and the rocker arm/shaft assembly.

6. Remove the camshaft from the cylinder head.

NOTE: Be sure to keep the disassembled parts in order for reinstallation purposes.

7. Inspect the camshaft for wear and/or damage, if necessary, replace the camshaft.

NOTE: When installing the camshaft, position it on the cylinder head with its dowel pin pointing upward.

8. To install, lubricate the camshaft and reverse the removal procedures. Torque the rocker arm/shaft assembly-to-cylinder head bolts to 11-18 ft. lbs., the camshaft sprocket-to-camshaft bolt to 87-116 ft. lbs. Readjust the valve clearances, if necessary.

AXXESS

1. Release the fuel pressure. Disconnect the negative battery cable.

2. Rotate the crankshaft to position the No. 1 cylinder on the TDC of its compression stroke.

3. Remove the distributor cap and move it aside.

4. Using chalk, matchmark the rotor to the distributor housing and the distributor housing to the cylinder head.

5. Remove the distributor hold-down clamp and the distributor from the engine.

6. Remove the rocker arm cover.

7. Remove the timing chain cover and the timing chain from the camshaft sprocket.

8. Remove the rocker arm/shaft assembly-to-cylinder head bolts and the rocker arm/shaft assembly.

9. Remove the camshaft from the cylinder head.

NOTE: Be sure to keep the disassembled parts in order for reinstallation purposes.

10. Inspect the camshaft for wear and/or damage, if necessary, replace the camshaft.

NOTE: When installing the camshaft, position it on the cylinder head with its dowel pin pointing upward.

11. To install, lubricate the camshaft and reverse the removal procedures. Torque the rocker arm/shaft assembly-to-cylinder head bolts to 11-18 ft. lbs., the camshaft sprocket-to-camshaft bolt to 87-116 ft. lbs.

3.0L Engine

1. Relieve the fuel pressure. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Remove the rocker shafts with the rocker arms; loosen the bolts in 2-3 stages.

4. Remove the hydraulic valve lifters and lifter guide.

NOTE: Hold the valve lifters with a wire so they will not drop from the lifter guide. Place identification marks on the lifters to avoid mixing them up.

5. From the rear of the cylinder head, remove the cylinder head rear cover the camshaft bolt and the locating plate.

6. Remove the camshaft and the camshaft oil seal through the front of the cylinder head.

To install:

7. Clean the gasket mounting surfaces.

8. Install the camshaft by performing the following procedures:

a. Install the camshaft.

b. Apply engine oil to the camshaft oil seal and install it in place.

c. Adjust the camshaft endplay with the correct locating plate.

9. Install the camshaft pulley(s).

NOTE: The right side and the left side camshaft pulleys are different parts. Install them in their correct positions. The right side pulley has a R3 identification mark and the left side has an L3.

10. To complete the installation, use new gaskets, sealant, if necessary and reverse the removal procedures.

11. Adjust the timing belt. Refill the cooling system. Start the engine, allow it to reach operating temperatures and check for leaks.

Piston and Connecting Rod

POSITIONING

View of the piston/rod identification and positioning - 2.4L engine

View of the piston/rod identification and positioning - 3.0L engine

DIESEL ENGINE MECHANICAL

Engine

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and safely support the vehicle.

2. Remove the engine undercover.

3. Disconnect the windshield washer hose and remove the hood; scribe matchmarks around the hinges for easy installation.

4. Drain the engine oil and the engine cooling system.

5. If equipped with an automatic transmission, drain the fluid.

6. Disconnect the air cleaner hose and remove the air cleaner.

7. Remove the radiator shroud and the radiator.

NOTE: If equipped with an automatic transmission, disconnect and plug the oil cooler lines at the radiator.

8. Remove the coupling fan.

9. Disconnect both heater hoses from the engine.

10. Remove the drive belts.

11. If equipped, remove the power steering pump from its bracket and move it aside; do not disconnect the pressure lines. Disconnect the ground strap from the bracket.

12. If equipped with air conditioning, loosen the drive belt and remove the air conditioning compressor and move it aside; do not disconnect the coolant lines.

13. Disconnect the shift control from the transmission.

14. On 4WD models, disconnect the starter leads and remove the starter. On 2WD models, disconnect the starter motor leads.

15. Disconnect the speedometer cable. Label and disconnect any electrical leads from the transmission.

16. If equipped with a manual transmission, remove the clutch release cylinder and its bracket from the transmission. Position it aside with disconnecting the hydraulic lines.

17. Remove the bolts and disconnect the exhaust pipe from the manifold.

18. On 4WD models, matchmark the front driveshaft to the transfer case flange and remove the front driveshaft.

19. On 4WD models, carefully, slide a floor jack under the front differential carrier and remove the front mounting bolt. Remove the rear mounting

bolts and crossmember and slowly lower the carrier.

20. On 4WD models, remove the transmission-to-engine bracket mounting nuts.

21. On 4WD models, remove the mounting bolts from the front engine mounts.

22. Attach an engine hoist chain to the lifting brackets on the engine and raise the engine enough to ease the weight on the front and rear engine mount insulators.

23. On 4WD models, remove the front differential carrier.

24. On 2WD models, matchmark the rear driveshaft-to-transmission flange and remove the driveshaft; be sure to plug the hole in the extension housing.

25. On 2WD models, remove the transmission-to-rear engine mount bracket bolts.

26. On 2WD models, remove the transmission crossmember.

27. On 4WD models, remove the transmission-to-engine mounting bolts.

28. Tighten the engine hoist chain and carefully lift the engine (4WD) or engine/transmission (2WD) assembly up and out of the vehicle; be careful not to bump into anything as the engine is removed from the engine compartment.

To install:

29. Lower the engine/transmission assembly into the engine compartment.

30. Raise the transmission onto the crossmember with a floor jack.

31. Align the holes in the engine mounts and the frame, install the bolts and remove the engine hoist chain.

32. On 4WD models, install the transmission-to-engine mounting bolts. Torque the 16mm and 25mm bolts to 22–29 ft. lbs. (29–39 Nm).

33. On 2WD models, install the transmission member.

34. On 2WD models, install the transmission-to-rear engine mount bracket bolts and torque to 30–38 ft. lbs. (41–52 Nm).

35. On 2WD models, install the rear driveshaft to the transmission flange.

36. On 4WD models, install the front differential carrier.

37. On 4WD models, install the mounting bolts for the front engine mounts and torque to 30–38 ft. lbs. (41–52 Nm) for the right side and 39–52 ft. lbs. (53–71 Nm) for the left side.

38. On 4WD models, install the transmission-to-engine bracket mounting nuts and torque to 30–38 ft. lbs. (41–52 Nm).

39. On 4WD models, align the matchmarks on the front driveshaft to those on the transfer case flange and install the front driveshaft.

40. Connect the exhaust pipe to the manifold.

41. Install the clutch release cylinder and its bracket to the transmission.

42. Connect the speedometer cable. Connect any electrical leads to the transmission.

43. On 4WD models, connect the starter leads and install the starter. On 2WD models, connect the starter leads.

44. Install the air conditioning compressor and drive belt.

45. Install the power steering pump and its bracket, if equipped; be sure to connect the ground strap to the bracket.

46. Install the drive belts.

47. Connect the heater hoses and the coupling fan.

48. Install the radiator and shroud. If equipped with an automatic transmission, unplug oil cooler lines and connect them to the radiator.

49. Refill the engine and the automatic transmission.

50. Install and adjust the hood. Install the undercover.

51. Connect the negative battery cable, start the engine, allow it to reach normal operating temperatures and check for leaks.

Cylinder Head

REMOVAL & INSTALLATION

1. Relieve the fuel pressure. Disconnect the negative battery cable.

2. Remove the air cleaner.

3. Remove the crankcase vent hose and remove the intake and exhaust manifolds; these are bolted together.

4. Remove the alternator, bracket and belts.

5. Disconnect the coolant hose between the head and oil cooler.

6. Remove the fuel filter assembly.

7. Disconnect and plug the injection lines from the pump and the injectors.

8. Remove the bypass hoses between the coolant pump and the thermostat housing.

9. Remove the fan.

10. Remove the rocker arm cover and the rocker arm shaft assembly.

11. Remove the pushrods and keep them in order.

12. Remove the fuel return lines.

13. Remove the injection nozzles from the cylinder head.

14. Remove the cylinder head bolts, gradually, in sequence.

15. Remove the cylinder head from the block. On occasions, the precombustion chambers may fall out, especially if the head is bumped or handled roughly. Take care that they are returned to their original positions, if this occurs.

Cylinder head bolt removal sequence – 2.5L diesel engine

Cylinder head bolt torquing sequence – 2.5L diesel engine

To install:

16. Remove the head gasket and O-rings.

17. Clean and inspect all parts.

18. Using a straight edge and a feeler gauge, check the head for warpage; maximum warpage is 0.0079 in. (0.2mm).

NOTE: If refinishing the head, do not remove more than 0.011 in. (0.28mm).

19. Using a new cylinder head gasket, place it on the block with the stainless steel inset side facing upward.

20. Install new O-rings around the water and oil passages.

21. Position the cylinder head onto the block.

22. Install the cylinder head bolts by performing the following procedures:

a. Lubricate the head bolts with engine oil.

b. Torque the large bolts to 59–78 ft. lbs. (43–58 Nm).

c. Torque the small bolts to 14–22 ft. lbs. (20–29 Nm).

d. Torque the large bolts to 87–94 ft. lbs. (118–127 Nm).

e. Torque the small bolts to 33–40 ft. lbs. (44–54 Nm).

23. Install the pushrods, pressing down and turning them to be sure of proper seating.

24. Install the rocker arm shaft assembly and torque the bolts, in sequence, to 18 ft. lbs. from the center to each end.

25. Install the injection nozzles.

26. Install the remaining components as they were removed.

Valve Lash

ADJUSTMENT

NOTE: The engine must be

warm before the valves can be adjusted.

1. Disconnect the negative battery cable.
2. Remove the rocker arm cover.
3. Rotate the crankshaft to position the No. 1 cylinder on TDC of its compression stroke.
4. Loosen the adjusting screw locknuts.
5. Using a 0.014 in. (0.35mm) feeler gauge, adjust the valve clearance of valves No. 1, 2, 3 and 5.
6. Rotate the crankshaft 1 complete revolution to position the No. 4 cylinder on TDC of its compression stroke.
7. Using a 0.014 in. (0.35mm) feeler gauge, adjust the valve clearance of valves No. 4, 6, 7 and 8.
8. After adjustment, torque the locknuts to 14–18 ft. lbs. (20–25 Nm).
9. Install the rocker arm cover and connect the negative battery cable.

Rocker Arms/Shafts

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the rocker arm cover.
3. Remove the rocker arm shaft-to-cylinder head bolts; work from the center toward the outer ends.
4. Lift the shaft assembly from the cylinder head. Remove the cotter pin, the washer and the outer spring from the end of the shaft.
5. Slide the rocker arm and bracket off the shaft.

NOTE: It may be necessary to immerse the assembly in water heated to 160°F (71°C) for a few minutes to free the rocker arms; never hammer them off.

6. Install the rocker arms and brackets onto the shaft and install the spring, a new washer and cotter pin to the outer ends of the shaft.

7. Position the shaft/arm assembly onto the cylinder head and torque the mounting bolts, using 2–3 stages, to 14–18 ft. lbs. (20–22 Nm).

Combination Manifold

REMOVAL & INSTALLATION

NOTE: To remove the gasket, it is necessary to remove the exhaust manifold.

1. Disconnect the negative battery cable.
2. Drain the cooling system.
3. Label and disconnect the lines and hoses from the throttle chamber, dropping resistor and breather. On

California models, disconnect the EGR pipe from the valve.

4. Disconnect and remove the dashpot from the intake manifold, except California models, or exhaust manifold, for California models.

View of the valve locations and torquing sequence—diesel engine

5. Remove the intake manifold-to-cylinder head bolts and the manifold.

6. Remove the exhaust manifold-to-exhaust pipe bolts. Remove the exhaust manifold-to-cylinder head bolts and the manifold.

7. Clean the gasket mounting surfaces.

8. Using a new gasket, install the exhaust manifold and the intake manifold; torque the bolts in 2–3 steps.

9. To complete the installation, reverse the removal procedures.

10. Refill the cooling system. Start the engine and check for leaks.

Exploded view of the intake and exhaust manifolds—2.5L diesel engine

Timing Gear Front Cover

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the drive belts, the fan and the pulley.
3. Remove the water pump bypass hose and allow the cooling system to drain below the level of the water pump.
4. Remove the water pump-to-engine bolts and the water pump; discard the gasket.
5. Using a 41mm socket, remove the crankshaft pulley nut.
6. Using a mallet, drive the pulley from the crankshaft.
7. Remove the timing gear cover-to-engine bolts and the cover.

To install:

8. Clean the gasket mounting surfaces.

NOTE: When the timing gear cover is removed, the front seal should be replaced.

9. Using a new gasket, install the timing gear cover; torque the cover-to-engine bolts to 7–9 ft. lbs. (10–13 Nm).
10. Install the crankshaft pulley and torque the nut to 217–239 ft. lbs. (294–324 Nm).
11. Install the water pump.

NOTE: Do not tighten the water pump bolts until the belt adjuster is installed with the alternator.

12. Install the water pump bypass hose, the pulley and cooling fan. Refill the cooling system.

13. Start the engine, allow it to reach normal operating temperatures and check for leaks.

Front Cover Oil Seal

REPLACEMENT

1. Disconnect the negative battery cable. Drain the cooling system.
2. Remove the front cover.
3. Using a small prybar, pry the old seal from the cover.
4. Lubricate the new seal with engine oil and press it into the front cover; be sure the flat side faces forward and the lip faces the engine.
5. Install the front cover.
6. Refill the cooling system.

Timing Gears

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Drain the cooling system.

Exploded view of the timing gear cover and camshaft assembly—2.5L diesel engine

Removing the timer gear—2.5L diesel engine

Installing the oil slinger—2.5L diesel engine

Aligning the timing gear marks—2.5L diesel engine

2. Remove the front cover.
3. Remove the timing gear round nut.
4. Using a timer extractor tool, thread the tool into the timer weight holder. Remove the timing gear assembly by threading the extractor tool bolt.
5. Unbolt and remove the camshaft gear set.

6. Remove the oil slinger. Unbolt the crankshaft gear and remove it with a 2-armed gear puller.

To install:

7. Install the camshaft gear.
8. Install the crankshaft gear and oil slinger while carefully aligning the timing marks. Measure the gear backlash; the backlash should be 0.0028–0.0079 in. (0.071–0.200mm).
9. With the No. 1 piston at TDC, mesh the timing gear and idler gear at the Y marks. After aligning the gear with the keyway, secure the timer assembly with a lockwasher and the round nut. Torque the nut to 50–58 ft. lbs.
10. Install the timing gear cover.

NOTE: If the gear case oil jet was removed, install it in the same relationship.

Measuring the timing gear backlash – 2.5L diesel engine

Removing the camshaft locating bolts – 2.5L diesel engine

11. Install the oil pump drive spindle by aligning the oil pump driveshaft groove and the camshaft oil pump drive gear with the spindle.

Piston and Connecting Rod

POSITIONING

View of the piston and connecting rod locating points – 2.5L diesel engine

Orientation of the oil jet – 2.5L diesel engine

11. To complete the installation, reverse the removal procedures.

Camshaft

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Drain the cooling system.
2. Remove the cylinder head.
3. Remove the valve lifters and mark them for reassembly.
4. Remove the front case and timing gear cover.
5. Remove the tachometer drive support nuts.
6. Remove the timer round nut.
7. Thread the timer extractor tool into the timer weight holder. Remove the timer assembly by tightening the extractor bolt.
8. Remove the oil pump drive spindle.
9. Remove the camshaft locating plate bolts and carefully slide the camshaft from the engine.
10. Coat the camshaft with clean engine oil and carefully slide it into the block. Install the locating plate.

- c. Remove the transmission-to-rear engine mount bracket nuts.
- d. Remove the engine mount nuts and bolts.

e. Attach an engine hoist and raise the engine slightly.

4. On 2WD models, remove the front crossmember.

5. Remove the oil pan-to-engine bolts. Insert a seal cutter tool between the cylinder block and the oil pan and tap it around the circumference of the pan with a hammer. Remove the oil pan.

NOTE: Be careful not to drive the seal cutter into the oil pump or rear oil seal retainer as damage may occur.

View of the oil pan bolt torquing sequence – 2.4L engine

To install:

6. Clean the gasket mounting surfaces.
7. Apply a continuous $\frac{1}{8}$ in. bead of sealant to the oil pan mounting surface; be sure to trace sealant bead to the inside of the bolt holes where there is no groove.
8. Install the oil pan and torque the bolts to 4–5 ft. lbs. (4–7 Nm).
9. To complete the installation, reverse the removal procedures.
10. Wait at least 30 minutes and refill the crankcase. Start the engine and allow it to reach normal operating temperatures and check for leaks.

AXXESS

1. Raise and safely support the vehicle.
2. Drain the engine oil.
3. Remove the front exhaust tube and the front side gusset.
4. On 2WD models, remove the crossmember.
5. Remove the oil pan-to-engine bolts. Insert a seal cutter tool between the cylinder block and the oil pan and tap it around the circumference of the pan with a hammer. Remove the oil pan.

NOTE: Be careful not to drive the seal cutter into the oil pump or rear oil seal retainer as damage may occur.

To install:

6. Clean the gasket mounting surfaces.

ENGINE LUBRICATION

Oil Pan

REMOVAL & INSTALLATION

2.4L Engine

EXCEPT AXXESS

1. Raise and safely support the vehicle.
2. Remove the engine undercover and drain the engine oil.
3. On 4WD models, perform the following procedures:
 - a. Remove the bolt from the front differential carrier member.
 - b. Position a floor jack under the front differential carrier and remove the mounting bolts.

7. Apply a continuous $\frac{1}{8}$ in. bead of sealant to the oil pan mounting surface; be sure to trace sealant bead to the inside of the bolt holes where there is no groove.

8. Install the oil pan and torque the bolts to 5–7 ft. lbs. (7–10 Nm).

9. To complete the installation, reverse the removal procedures.

10. Wait at least 30 minutes and refill the crankcase. Start the engine and allow it to reach normal operating temperatures and check for leaks.

2.5L Diesel Engine

1. Raise and safely support the vehicle.

2. Remove the undercover and drain the engine oil.

3. Remove the stabilizer bar bracket bolts.

4. Remove the front crossmember.

5. Remove the idler arm.

6. Remove the oil pan-to-engine bolts, insert a seal cutter tool between the cylinder block and the oil pan, tap the tool around the circumference, with a hammer, and remove the oil pan.

NOTE: Be careful not to drive the seal cutter into the oil pump or rear oil seal retainer for damage may occur.

7. Clean the gasket mounting surfaces.

To install:

8. Apply sealant to the oil pump and oil seal retainer gasket.

9. Apply a continuous $\frac{1}{8}$ in. bead of sealant to the oil pan mounting surface; be sure to trace sealant bead to the inside of the bolt holes where there is no groove.

10. Install the oil pan and torque the bolts to 5–6 ft. lbs. (7–10 Nm).

11. To complete the installation, reverse the removal procedures.

12. Wait at least 30 minutes and refill the crankcase. Start the engine and allow it to reach normal operating temperatures and check for leaks.

3.0L Engine

1. Raise and safely support the vehicle.

2. Remove the undercover and drain the engine oil.

3. On 2WD models, remove the stabilizer bar bracket bolts.

4. On 4WD models, remove the front driveshaft and disconnect the halfshafts at the transfer case. Position a floor jack under the front differential carrier and remove the mounting bolts.

5. On 2WD models, remove the front crossmember.

6. Remove the idler arm and the starter motor.

View of the oil pan bolt loosening sequence—torque the bolts by reversing the loosening sequence—3.0L engine

7. On 4WD models, remove the transmission-to-rear engine mount bracket nuts and the engine mount nuts/bolts.

8. Remove the engine gussets.

9. On 4WD models, attach a hoist to the engine and raise the engine slightly.

10. Remove the oil pan-to-engine bolts, insert a seal cutter tool between the cylinder block and the oil pan, tap the tool around the circumference, with a hammer, and remove the oil pan.

NOTE: Be careful not to drive the seal cutter into the oil pump or rear oil seal retainer for damage may occur.

11. Clean the gasket mounting surfaces.

To install:

12. Apply sealant to the oil pump and oil seal retainer gasket.

13. Apply a continuous $\frac{1}{8}$ in. bead of sealant to the oil pan mounting surface; be sure to trace sealant bead to the inside of the bolt holes where there is no groove.

14. Install the oil pan and torque the bolts to 4–5 ft. lbs. (4–7 Nm).

15. To complete the installation, reverse the removal procedures.

16. Wait at least 30 minutes and refill the crankcase. Start the engine and allow it to reach normal operating temperatures and check for leaks.

Oil Pump

REMOVAL & INSTALLATION

2.4L Engine

EXCEPT AXCESS

The oil pump is an external type, mounted to the right side of the crankshaft pulley.

1. Disconnect the negative battery cable.

2. Rotate the crankshaft to position the No. 1 cylinder on the TDC of the compression stroke.

3. If equipped with a splash pan, remove it. If necessary, remove the stabilizer bar.

View of the oil pump and front cover—2.4L engine—except Axcess

4. Remove the oil pump-to-housing bolts and the oil pump from the engine.

5. Clean the gasket mounting surfaces.

6. To install, use a new gasket, fill the oil pump with engine oil, align the drive spindle punch mark with the oil hole on the oil pump, then, insert the oil pump into the housing until the driveshaft tang fits into the distributor shaft notch. Torque the oil pump-to-engine housing bolts to 8–11 ft. lbs. Start the engine and check for leaks.

AXCESS

The oil pump rides on the crankshaft and is attached to the front cover.

1. Disconnect the negative battery cable.

2. Raise and safely support the vehicle. Drain the cooling system.

3. Drain the engine oil.

4. Remove the oil pan and the front cover.

5. Remove the oil pump cover-to-front cover bolts, the cover and the oil pump gears.

NOTE: When the oil pump is removed, replace the oil seal.

6. Inspect and/or replace the oil pump gears.

7. Using petroleum jelly, pack the oil pump cavity and reverse the removal procedures.

2.5L Diesel Engine

1. Disconnect the negative battery cable.

2. Raise and safely support the vehicle. Drain the engine oil.

3. Remove the oil pump drive spindle.

4. Remove the oil pan.

5. Remove the oil pump-to-engine bolts and the oil pump; discard the gasket.

6. Using a new gasket, install the oil pump. Torque the bolts to 9–14 ft. lbs. (13–19 Nm).

7. Install the drive spindle by aligning it with the oil pump driveshaft

Exploded view of the oil pump assembly—2.4L engine—Axxess

groove in the cylinder block and the camshaft oil pump drive gear.

8. Place a new O-ring on the spindle support and bolt it to the block.

9. Install the oil pan and refill the engine with oil.

10. Start the engine and check for leaks.

3.0L Engine

The oil pump is mounted at the front of the engine behind the crankshaft pulley.

1. Disconnect the negative battery cable.

2. Raise and safely support the vehicle. Drain the cooling system and the crankcase.

3. Remove the oil pan and the timing belt.

4. Remove the crankshaft timing sprocket using a wheel puller and the timing belt plate.

5. Remove the oil pump strainer and the pickup tube from the oil pump.

6. Remove the oil pump-to-engine bolts and the oil pump from the engine.

7. Clean the gasket mounting surfaces.

NOTE: When the oil pump is removed, replace the oil seal.

8. To install, use new gaskets, silicone sealant, pack the oil pump cavity with petroleum jelly and reverse the removal procedures. Torque as follows:

Oil pump-to-engine 6mm bolts

2WD—4.3–5.1 ft. lbs.

4WD—4.6–6.1 ft. lbs.

Oil pump-to-engine 8mm bolts

2WD—9–12 ft. lbs.

4WD—16–22 ft. lbs.

Pickup tube-to-oil pump bolts—12–15 ft. lbs.

Pickup tube bracket-to-engine bolt—4.6–6.1 ft. lbs.

CHECKING

To check the oil pump clearances, the oil pump must be removed from the engine and disassembled. If the parts do not meet specifications, replace them or the oil pump assembly.

2.4L Engine

EXCEPT AXXESS

Using a feeler gauge, check the following clearances:

Inner rotor tip-to-outer rotor—

0.0047 in. (0.12mm) max.

Outer rotor-to-housing—0.0059–0.0083 in. (0.15–0.21mm)

Side clearance (with gasket)—0.0016–0.0031 in. (0.04–0.07mm)

AXXESS

Using a feeler gauge, check the following clearances:

Pump body-to-outer gear—0.0043–0.0079 in. (0.11–0.20mm)

0.0126 in. (0.22–0.33mm)
Housing-to-inner gear—0.0020–
0.0035 in. (0.05–0.09mm)
Housing-to-outer gear—0.0020–
0.0043 in. (0.05–0.11mm)

Rear Main Bearing Oil Seal

REMOVAL & INSTALLATION

Except Axxess

1. Disconnect the negative battery cable.
2. Raise and safely support the vehicle. Remove the starter.
3. Remove the transmission from the vehicle.
4. If equipped with a manual transmission, remove the clutch-to-flywheel bolts and the clutch assembly from the vehicle.
5. Remove the flywheel-to-crankshaft bolts and the flywheel from the engine.
6. Remove the rear oil seal retainer-to-engine bolts, the rear oil seal retainer-to-oil pan bolts and the retainer.
7. Using a small pry bar, pry the rear oil seal from the retainer; be careful not to damage the mounting surfaces. Clean the oil seal mounting surfaces.
8. Using the oil seal installation tool, lubricate the new oil seal lips with engine oil and drive the the seal into the retainer until it seats.
9. To complete the installation, reverse the removal procedures. Start the engine and check for leaks.

Removing the rear oil seal from the retainer—typical

Axxess

1. Disconnect the negative battery cable.
2. Raise and safely support the vehicle. Remove the starter.
3. On 2WD models, remove the halfshafts from the transaxle.
4. On 4WD models, remove the halfshaft from the transaxle/transfer case assembly.
5. Remove the transaxle-to-engine bolts, the transaxle-to-transfer case bolts for 4WD, and lower the transaxle from the vehicle.
6. If equipped with a manual transaxle, remove the clutch-to-flywheel bolts and the clutch assembly from the vehicle.
7. Remove the flywheel-to-crankshaft bolts and the flywheel from the engine.
8. Remove the rear oil seal retainer-to-engine bolts, the rear oil seal retainer-to-oil pan bolts and the retainer.
9. Using a small pry bar, pry the rear oil seal from the retainer; be careful not to damage the mounting surfaces. Clean the oil seal mounting surfaces.
10. Using the oil seal installation tool, lubricate the new oil seal lips with engine oil and drive the the seal into the retainer until it seats.
11. To complete the installation, reverse the removal procedures. Start the engine and check for leaks.

Transmission Assembly

REMOVAL & INSTALLATION

Pick-Up and Pathfinder

1. Disconnect the negative battery cable. Raise and safely support the vehicle.
2. Disconnect the accelerator linkage, if necessary.
3. Remove the driveshaft from the transmission (2WD) or transfer case (4WD); be sure to plug the driveshaft opening to keep the transmission/transfer case oil from draining out. If equipped with 4WD, remove the transfer case-to-front differential driveshaft; it may be necessary to remove the front differential carrier/crossmember.
4. If necessary, disconnect the exhaust pipe from the exhaust manifold.
5. Disconnect the electrical connectors from the back-up light switch and the neutral switch wires, if equipped.
6. Disconnect the speedometer cable from the transmission extension housing.
7. From the clutch housing, remove the slave cylinder and the starter.
8. Using a floor jack, support the transmission. On 4WD models, remove the transfer case-to-transmission bolts and the transfer case.
9. Place the transmission shifting lever in the N position, then, remove the console box, the E-ring and the shift lever. On the 4WD models, remove the transfer case shift lever.
10. Using a block of wood, place it between a floor jack and the engine oil pan to prevent damage to the oil pan, then, support the engine.
11. Remove the transmission-to-rear crossmember bolts, the crossmember-to-chassis bolts and the rear crossmember.
12. Remove the transmission-to-engine bolts, pull the transmission rearward until the pilot shaft is free of the engine, then, lower the transmission from the vehicle.
13. Clean the engine-to-transmission mounting surfaces.

To install:

14. Lightly grease the input shaft splines and reverse the removal procedures.
15. Torque as follows:
 - Upper engine-to-transmission bolts—29–36 ft. lbs.
 - Bottom engine-to-transmission bolts
 - 3.0L engine—22–29 ft. lbs.
 - 2.4L engine—14–18 ft. lbs.
 - 2.5L diesel engine—7–9 ft. lbs.

Crossmember-to-chassis bolts—23–31 ft. lbs.

Slave cylinder-to-clutch housing bolts—22–30 ft. lbs.

16. Be sure to align the marks made earlier on the U-joint and differential flange when installing the driveshaft, to maintain driveline balance.

17. To complete the installation, reverse the removal procedures.

Van

1. Disconnect the negative battery cable.
2. Raise and safely support the vehicle.
3. Remove the driveshaft from the transmission; be sure to plug the driveshaft opening to keep the transmission oil from draining out.
4. Disconnect the exhaust pipe from the exhaust manifold.
5. Disconnect the electrical connectors from the back-up light switch and the neutral switch wires, if equipped.
6. Disconnect the speedometer cable from the transmission extension housing.
7. From the clutch housing, remove the slave cylinder and the starter.
8. Using a floor jack, support the transmission.
9. Place the transmission shifting lever in the N position, then, disconnect the shift cables from the transmission.
10. Using a block of wood, place it between a floor jack and the engine oil pan to prevent damage to the oil pan, then, support the engine.
11. Remove the transmission-to-rear crossmember bolts, the crossmember-to-chassis bolts and the rear crossmember.
12. Remove the transmission-to-engine bolts, pull the transmission rearward until the pilot shaft is free of the engine, then, lower the transmission from the vehicle.
13. Clean the engine-to-transmission mounting surfaces.
14. To install, lightly grease the input shaft splines and reverse the removal procedures. Torque as follows:
 - Upper engine-to-transmission bolts—29–36 ft. lbs.
 - Bottom engine-to-transmission bolts
 - 3.0L engine—22–29 ft. lbs.
 - 2.4L engine—14–18 ft. lbs.
 - Crossmember-to-chassis bolts—23–31 ft. lbs.
 - Slave cylinder-to-clutch housing bolts—22–30 ft. lbs.
15. Be sure to align the marks made earlier on the U-joint and differential flange when installing the driveshaft, to maintain driveline balance.

MANUAL TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Exploded view of the shift change lever assembly—Van

LINKAGE ADJUSTMENT

Van

1. To adjust the selector cable, perform the following procedures:
 - a. Remove the console cover, then, loosen the adjuster locknut.
 - b. Raise and support the vehicle safely.
 - c. Working under the vehicle, position the shift change lever (on the transmission) to the 3rd or 4th gear position.
 - d. From inside the vehicle, adjust the selector cable length using the adjuster.
 - e. After adjustment, tighten the adjuster locknut.
2. To adjust the shifter cable, perform the following procedures:
 - a. From under the vehicle, loosen the trunnion-to-shift cable locknut.
 - b. Remove the shift cable trunnion from the cross shaft.

Using a pin to adjust the shift control lever and roller bearing—Van.

- c. Position the transmission cross shaft in the N position.
- d. Using a 0.16 in (4mm) pin, insert it (as vertical as possible) into the adjustment holes of both the control lever and roller bearing.
- e. Adjust the trunnion position and install it into the cross shaft.
- f. Torque the trunnion locknut to 9-12 ft. lbs.

MANUAL TRANSAXLE

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transaxle Assembly

REMOVAL & INSTALLATION

Axxess

2WD MODEL

1. Disconnect the negative battery cable. Remove the battery and bracket.
2. Remove the air cleaner with the air flow meter.
3. Remove the air duct.

4. Remove the air injection vent (AIR) unit.

5. Remove the slave cylinder-to-transaxle bolts and move the cylinder aside.

6. Remove the clutch hose clamp.

7. Disconnect the speedometer pinion and the position switch connectors.

8. Remove the breather hose clamp.

9. Disconnect the electrical connectors from the starter. Remove the starter-to-transaxle bolts and the starter.

10. Remove the shift control rod and support rod from the transaxle.

11. Raise and safely support the vehicle.

12. Drain the transaxle.

13. Remove the halfshafts from the transaxle.

14. Using a floor jack, support the engine; do not position the jack under the oil pan drain plug.

15. Remove the transaxle-to-engine bolts, using the proper equipment, move the transaxle rearward and lower it from the vehicle.

16. To install, reverse the removal procedures. Torque the transaxle-to-engine bolts as follows:

Bolt No. 1—29–36 ft. lbs. (39–49 Nm)

Bolt No. 2—22–30 ft. lbs. (30–40 Nm)

Bolt No. 3—22–30 ft. lbs. (30–40 Nm)

Bolt No. 4—22–30 ft. lbs. (30–40 Nm)

Bolt No. 5—29–36 ft. lbs. (39–49 Nm)

Bolt No. 6—29–36 ft. lbs. (39–49 Nm)

17. To complete the installation, reverse the removal procedures.

18. Refill the transaxle.

- M/T TO ENGINE (GUSSET)
- ENGINE (GUSSET)
- M/T TO STARTER MOTOR

- TRANSFER TO M/T
- M/T TO TRANSFER
- M/T TO STARTER MOTOR
- END PLATE TO ENGINE

View of the transaxle bolt torquing sequence—4WD Axxess

12. Remove the driveshaft from the transfer case.

13. Remove the shift control rod and support rod from the transaxle.

14. Remove the front exhaust tube.

15. Raise and safely support the vehicle.

16. Drain the transaxle and the transfer case.

17. Remove the halfshafts from the transaxle/transfer case assembly.

18. Remove the left side transverse link and gusset.

19. Using a floor jack, support the engine; do not position the jack under the oil pan drain plug.

20. Remove the rear mount and engine front mount.

21. Remove the transaxle-to-engine bolts and the transaxle-to-transfer case bolts, using the proper equipment, move the transaxle rearward and lower it from the vehicle.

22. To install, reverse the removal procedures. Torque the transaxle-to-engine bolts as follows:

Bolt No. 1—29–36 ft. lbs. (39–49 Nm)

Bolt No. 2—22–30 ft. lbs. (30–40 Nm)

Bolt No. 3—29–36 ft. lbs. (39–49 Nm)

Bolt No. 4—22–30 ft. lbs. (30–40 Nm)

Bolt No. 5—22–30 ft. lbs. (30–40 Nm)

Bolt No. 6—22–30 ft. lbs. (30–40 Nm)

Bolt No. 7—29–36 ft. lbs. (39–49 Nm)

Bolt No. 8—29–36 ft. lbs. (39–49 Nm)

Bolt No. 9—22–30 ft. lbs. (30–40 Nm)

23. To complete the installation, reverse the removal procedures.

24. Refill the transaxle.

25. Check and/or adjust the front wheel alignment.

CLUTCH

Clutch Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and safely support the vehicle.

2. Remove the transmission (except Axxess) or the transaxle (Axxess).

3. Using a piece of chalk, paint or a center punch, mark the clutch assembly-to-flywheel relationship so it can be reassembled in the same position from which it is removed.

4. Using a clutch aligning tool, insert it into the clutch disc hub.

5. Loosen the clutch cover-to-flywheel bolts, a turn at a time in an alternating sequence, until the spring tension is relieved to avoid distorting or bending the clutch cover. Remove the clutch assembly.

6. Inspect the flywheel for scoring, roughness or signs of overheating. Light scoring may be cleaned up with emery cloth, but any deep grooves or scoring warrant replacement or refacing (if possible) of the flywheel. If the clutch facings or flywheel are oily, inspect the transmission/transaxle front cover oil seal, the pilot bushing and engine rear seals, etc. for leakage; replace any leaking seals before replacing the clutch.

7. If the crankshaft pilot bushing is worn, replace it. Install it using a soft hammer. The factory supplied part does not have to be oiled, but check the procedure if you are using an after-market part. Inspect the clutch cover for wear or scoring and replace it, if necessary.

NOTE: The pressure plate and spring cannot be disassembled; replace the clutch cover as an assembly.

8. Inspect the clutch release bearing. If it is rough or noisy, it should be replaced. The bearing can be removed from the sleeve with a puller; this requires a press to install the new bearing. After installation, coat the sleeve groove, the release lever contact surfaces, the pivot pin/sleeve and the release bearing-to-transmission/trans-

4WD MODEL

1. Disconnect the negative battery cable. Remove the battery and bracket.

2. Remove the air cleaner with the air flow meter.

3. Remove the air duct.

4. Remove the air injection vent (AIV) unit.

5. Remove the slave cylinder-to-transaxle bolts and move the cylinder aside.

6. Remove the clutch hose clamp.

7. Disconnect the position switch connector.

8. Remove the breather hose clamp.

9. Disconnect the negative battery cable.

10. Disconnect the electrical connectors from the starter. Remove the starter-to-transaxle bolts and the starter.

11. Remove the speedometer pinion.

axle contact surfaces with a light coat of grease. Be careful not to use too much grease, which will run at high temperatures and get onto the clutch facings. Reinstall the release bearing on the lever.

9. Apply a thin coat of grease to the pressure plate wire ring, diaphragm spring, clutch cover grooves and the pressure plate drive bosses.

10. Apply a thin coat of Lubriplate® to the splines in the driven plate. Slide the clutch disc onto the splines and move it back and forth several times. Remove the disc and wipe off the excess lubricant. Be very careful not to get any grease on the clutch facings.

11. Assemble the clutch cover and the clutch plate on the clutch alignment arbor.

12. To complete the installation, align the clutch assembly-to-flywheel alignment marks and reverse the removal procedures; three dowels are used to locate the clutch cover on the flywheel. Torque as follows:

Clutch cover-to-flywheel bolts (in an alternating sequence, one turn at a time) — 16–22 ft. lbs.

Transmission/transaxle-to-engine bolts — 29–36 ft. lbs.

Clutch slave cylinder-to-transmission/transaxle bolts — 22–30 ft. lbs.

PEDAL HEIGHT/FREE-PLAY ADJUSTMENT

The pedal height is the distance from the top of the clutch pedal to the floor board (without the carpet).

The pedal freeplay is the distance the clutch pedal pad moves from the released position to the point where resistance is felt.

1. To adjust the pedal height on all models except the Van, perform the following procedure:

a. From under the dash, loosen the pedal stopper locknut.

b. Turn the pedal stopper until the specified pedal height is obtained: 9.29–9.69 in. (2.4L and 2.5L engines, except Axxess), 8.94–9.33 in. (3.0L engine, except Axxess) or 6.97–7.36 in. (Axxess).

c. After adjustment, torque the pedal stopper locknut to 12–16 ft. lbs.

2. To adjust the pedal height on the Van, perform the following procedure:

a. From under the dash, loosen the clutch switch locknut.

b. Turn the clutch switch until the specified pedal height is obtained: 6.97–7.36 in. (117–187mm).

c. After adjustment, torque the clutch switch locknut to 9–11 ft. lbs.

3. To adjust the pedal freeplay, perform the following procedures:

View of the clutch pedal assembly — except Van

View of the clutch pedal assembly — Van

a. Loosen the clutch pedal, pushrod locknut.

b. Using a ruler, measure the clutch pedal freeplay.

c. Turn the clutch pedal pushrod to the specified freeplay is: 0.04–0.06 in. (1986–89 Pick-Up and Pathfinder) or 0.04–0.12 in. (except 1986–89 Pick-Up and Pathfinder).

d. After adjustment, torque the locknut to 6–9 ft. lbs.

Clutch Master Cylinder

REMOVAL & INSTALLATION

The master cylinder is attached to a bracket located under the dash.

1. Disconnect the negative battery cable.

2. From under the dash, remove the clevis pin snap pin and pull the clevis pin from the clutch pedal.

3. Disconnect the clutch pedal arm from the pushrod clevis. Remove the

Exploded view of a typical clutch master cylinder

dust cover (boot) from the master cylinder body and pushrod. It will not go through the cowl without tearing.

4. Disconnect and plug the hydraulic line from the clutch master cylinder.

NOTE: Take precautions to keep brake fluid from coming in contact with any painted surfaces.

5. Remove the clutch master cylinder.

6. To install, reverse the removal procedures. Torque the clutch master cylinder-to-cowl bolts/nuts to 12–14 ft. lbs. for Van or to 5.8–8.7 ft. lbs. except Van.

7. Bleed the clutch hydraulic system.

Clutch Slave Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

AUTOMATIC TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

1. Pushrod
2. Dust cover
3. Piston spring
4. Piston
5. Operating cylinder
6. Bleeder screw

Exploded view of a typical clutch slave cylinder

2. If necessary, raise and safely support the vehicle.
3. Remove the slave cylinder-to-clutch housing bolts and the pushrod from the shift fork.
4. Disconnect and plug the hydraulic hose from the slave cylinder, then, remove the cylinder from the vehicle.
5. To install, reverse the removal procedures. Torque the slave cylinder-to-clutch housing bolts to 22-30 ft. lbs.
6. Bleed the clutch hydraulic system.

BLEEDING THE HYDRAULIC CLUTCH SYSTEM

1. Check and refill the clutch fluid reservoir to the full mark, if necessary. During the bleeding process, continue to check and replenish the reservoir to prevent the fluid level from getting lower than $\frac{1}{2}$ full.
2. Connect a clear vinyl hose to the bleeder screw on the slave cylinder. Immerse the other end of the hose in a clear jar $\frac{1}{2}$ filled with brake fluid.
3. Have an assistant pump the clutch pedal several times and hold it down. Loosen the bleeder screw slowly.
4. Tighten the bleeder screw and release the clutch pedal gradually. Repeat this operation until the air bubbles disappear from the brake fluid being expelled out through the bleeder screw.
5. When the air is completely removed, securely tighten the bleeder screw and replace the dust cap.
6. Check and refill the master cylinder reservoir as necessary.
7. Depress the clutch pedal several times to check the operation of the clutch and check for leaks.

Transmission Assembly

REMOVAL & INSTALLATION

2WD Models

1. Disconnect the negative battery cable.
2. Raise and safely support the vehicle.
3. If equipped with a 3.0L engine, remove the front exhaust tube.
4. Remove the oil filler tube from the transmission; be sure to plug the opening on the transmission. Disconnect and plug the oil cooler lines at the transmission.
5. Matchmark the driveshaft U-joint and differential flange, then, disconnect them from the differential. If the driveshaft is equipped with a center bearing, remove the center bearing bracket-to-chassis bolts and the driveshaft assembly. Plug the transmission extension housing to keep the fluid from leaking out.
6. Remove the torsion bar springs.
7. Remove the speedometer cable.
8. Remove the automatic transmission control linkage from the selector lever.
9. Disconnect the electrical harness connectors from the transmission.
10. Disconnect the electrical connectors and remove the starter.
11. If equipped with a 3.0L engine, remove the gusset securing the engine to the transmission.
12. Remove the torque converter housing dust cover. Using a piece of chalk, matchmark the converter with the drive plate for reassembly; the unit was balanced at the factory. Remove the torque converter-to-drive plate (flywheel) bolts; using a wrench on the crankshaft pulley bolt, rotate the crankshaft to expose the hidden torque converter bolts.
13. Using a floor jack and a block of wood (placed under the oil pan), support the engine. Using a transmission jack, support the transmission.

NOTE: When supporting the engine with a block of wood, do not position the wood under the oil drain plug.

View of the automatic transmission shift linkage—except Axxess

14. Remove the rear engine mount-to-crossmember bolts, the crossmember-to-chassis bolts and the crossmember.

15. Remove the transmission-to-engine bolts, then, slide the torque converter toward the transmission and secure it in place. Move the transmission rearward, lower and remove it from the vehicle.

To install:

16. Using a dial indicator, check the drive plate runout. Turn the crankshaft one full revolution. Maximum allowable runout is 0.020 in., if beyond specifications, replace the drive plate.

17. To install, use new gaskets (where necessary), align the torque converter-to-drive plate matchmarks and reverse the removal procedures.

NOTE: When installing the torque converter, be sure to align the notch in the converter with the projection on the oil pump.

18. To complete the installation, reverse the removal procedures. Torque as follows:

Torque converter-to-drive plate bolts—29-36 ft. lbs.

NOTE: Rotate the engine a few turns to make sure the transmission rotates freely without binding.

Upper engine-to-transmission bolt
Pick-Up and Pathfinder—29-36 ft. lbs.

Van—22-36 ft. lbs.

Lower engine-to-transmission bolts for Van—20-24 ft. lbs.

19. Check and/or refill the transmission with clean fluid. Adjust the shift linkage, the back-up light operation and the neutral switch.

4WD Models

1. Disconnect the negative battery cable.
2. Raise and safely support the vehicle.
3. If equipped with a 3.0L engine, remove the front exhaust tube.

4. Remove the oil filler tube from the transmission; be sure to plug the opening on the transmission. Disconnect and plug the oil cooler lines at the transmission.

5. Matchmark the driveshaft U-joint and differential flange, then, disconnect them from the differential. If the driveshaft is equipped with a center bearing, remove the center bearing bracket-to-chassis bolts and the driveshaft assembly. Plug the transfer case housing to keep the fluid from leaking out.

6. Remove the transfer control linkage from the transfer case.

7. Remove the torsion bar springs and the 2nd crossmember.

8. Remove the speedometer cable.

9. Remove the automatic transmission control linkage from the transmission.

10. Disconnect the electrical harness connectors from the transmission.

11. Disconnect the electrical connectors and remove the starter.

12. If equipped with a 3.0L engine, remove the gusset securing the engine to the transmission.

13. Remove the torque converter housing dust cover. Using a piece of chalk, matchmark the converter with the drive plate for reassembly; the unit was balanced at the factory. Remove the torque converter-to-drive plate (flywheel) bolts; using a wrench on the crankshaft pulley bolt, rotate the crankshaft to expose the hidden torque converter bolts.

14. Using a floor jack and a block of wood (placed under the oil pan), support the engine. Using a transmission jack, support the transmission/transfer case assembly.

NOTE: When supporting the engine with a block of wood, do not position the wood under the oil drain plug.

15. Remove the rear engine mount-to-crossmember bolts, the crossmember-to-chassis bolts and the crossmember.

16. Remove the transmission-to-engine bolts, then, slide the torque converter toward the transmission and secure it in place. Move the transmission/transfer case assembly rearward, lower and remove it from the vehicle.
To install:

17. Using a dial indicator, check the drive plate runout. Turn the crankshaft one full revolution. Maximum allowable runout is 0.020 in., if beyond specifications, replace the drive plate.

18. Using new gaskets (where necessary), align the torque converter-to-drive plate matchmarks and reverse the removal procedures.

NOTE: When installing the

torque converter, be sure to align the notch in the converter with the projection on the oil pump.

19. To complete the installation, reverse the removal procedures. Torque as follows:

Torque converter-to-drive plate bolts to 29–36 ft. lbs.

NOTE: Rotate the engine a few turns to make sure the transmission rotates freely without binding.

Upper engine-to-transmission bolt
Pick-Up and Pathfinder—29–36 ft. lbs.

Van—22–36 ft. lbs.

Lower engine-to-transmission bolts for Van—20–24 ft. lbs.

20. Check and/or refill the transmission with clean fluid. Adjust the shift linkage, the back-up light operation and the neutral switch.

SHIFT LINKAGE ADJUSTMENT

Pick-Up and Pathfinder

2WD FLOOR SHIFT MODELS

1. Place the shift selector in the **P** position.

2. Raise and safely support the vehicle.

3. From under the vehicle, loosen the shift lever locknuts.

4. Tighten the rear locknut **X** until it touches the trunnion; pulling the selector lever toward the **R** position (without pushing the button). Back off the rear locknut **X** a complete revolution, adjust the front locknut **Y** and torque the locknuts to 5.8–8.0 ft. lbs.

5. After adjustment, move the selector lever through the ranges to make sure it moves smoothly.

2WD Column Shift Models

1. Place the shift selector in the **P** position.

2. Raise and safely support the vehicle.

3. From under the vehicle, loosen the shift lever locknuts.

4. Tighten the front locknut **A** until it touches the trunnion; pulling the selector lever toward the **R** position (without pushing the button). Back off the front locknut **A** 2 complete revolutions, adjust the rear locknut **B** and torque the locknuts to 5.8–8.0 ft. lbs.

6. After adjustment, move the selector lever through the ranges to make sure it moves smoothly.

4WD FLOOR SHIFT MODELS

1. Place the shift selector in the **P** position.

2. Raise and safely support the vehicle.

View of the 2WD floor shift model automatic transmission shifter adjustment—Pick-Up and Pathfinder

View of the 2WD column shift model automatic transmission shifter adjustment—Pick-Up and Pathfinder

View of the 4WD floor shift model automatic transmission shifter adjustment—Pick-Up and Pathfinder

3. Remove the console cover.

4. Loosen the turn buckle locknuts.

5. Tighten the turn buckle until it aligns with the inner cable; pulling the selector lever toward the **R** position (without pushing the button). Back off the turn buckle a complete revolution, torque the locknuts to 3.3–4.3 ft. lbs.

6. After adjustment, move the selector lever through the ranges to make sure it moves smoothly.

Van

1. Place the shift selector in the **P** position.

2. Raise and safely support the vehicle.

3. From under the vehicle, loosen the shift lever locknuts.

4. Tighten the front locknut **X** until it touches the trunnion; pulling the selector lever toward the **R** position (without pushing the button). Back off

View of the floor shift model automatic transmission shifter adjustment—Van

the front locknut **X** a ¼ revolution, adjust the rear locknut **Y** and torque the locknuts to 7–9 ft. lbs.

5. After adjustment, move the selector lever through the ranges to make sure it moves smoothly.

KICKDOWN SWITCH ADJUSTMENT

1986-89 Vehicles with 71B Transmission

A kickdown switch is located inside the vehicle at the upper post of the accelerator pedal. Its purpose is to provide transmission downshifting when the accelerator pedal is fully depressed; a click can be heard just before the pedal bottoms out.

With the ignition switch in the **ON** position and the engine **OFF**, when the accelerator pedal is depressed fully, the kick-down switch contacts should be closed and the downshift solenoid activated, emitting a clicking sound. If the components fail to operate in this manner, check for continuity 1st at the switch and then at the solenoid if the switch checks out as being satisfactory. Replace either of the components as necessary.

VACUUM MODULATOR ADJUSTMENT

1986-89 Vehicles with 71B Transmission

1. Raise and safely support the vehicle.

2. Remove the vacuum modulator from the transmission.

3. Using a depth gauge, measure the **L** depth; be sure the vacuum throttle valve is pushed into the valve body as far as possible.

4. Select the correct length rod and install it into the vacuum modulator.

5. Using a new O-ring, install the modulator into the transmission.

View of the downshift solenoid—71B transmission 1986–89

THROTTLE LINKAGE ADJUSTMENT

1990 Vehicles with RL4R01A Transmission

1. Press the lock plate and move the adjusting tube in the direction **T**.

2. Return the lock plate.

3. Quickly, move the throttle drum from **P**₂ to **P**₁.

4. Ensure the throttle wire stroke **L** is within specified range between full throttle and idle; the throttle wire stroke **L** should be 1.50–1.65 in. (38–42mm).

NOTE: Adjust the throttle wire stroke when the throttle wire/accelerator wire is installed. Place marks on the throttle wire to facilitate measuring the wire stroke.

5. If the throttle wire stroke is not adjusted, the following problems may arise:

a. When full-open position **P**₁ of the throttle drum is closer to the direction **T**, the kickdown range will greatly increase.

b. When the full-open position **P**₁

of the throttle drum is closer to the direction **U**, the kickdown range will not occur.

6. After properly adjusting the throttle wire, make sure the parting line is as straight as possible.

NEUTRAL SAFETY SWITCH ADJUSTMENT

The neutral safety switch is located on the transmission shift selector lever. The switch operates the back-up lights and controls the operation of the starter. The starter should only operate when the transmission is in **P** or **N**.

View of the throttle wire adjustment—RL4R01A transmission—1990

Cross-sectional view of the vacuum diaphragm—71B transmission 1986–89

Measured depth "L" mm (in)	Rod length mm (in)	Part number
Under 25.55 (1.0059)	29.0 (1.142)	31932-X0103
25.65 - 26.05 (1.0098 - 1.0256)	29.5 (1.161)	31932-X0104
26.15 - 26.55 (1.0295 - 1.0453)	30.0 (1.181)	31932-X0100
26.65 - 27.05 (1.0492 - 1.0650)	30.5 (1.201)	31932-X0102
Over 27.15 (1.0689)	31.0 (1.220)	31932-X0101

Using a pin to align the neutral start safety switch—71B transmission 1986–89

PIN. DIA.
0.16 IN. (4MM)

Using a pin to align the neutral start safety switch—except 71B transmission 1986–89

1986-89 Vehicles with 71B Transmission

1. Unscrew the securing nut of the shift selector lever and the switch-to-transmission screws.

2. Position the shift selector to the N position (in vertical position and detent clicks). Move the switch slightly aside so the screw hole will be aligned with the pin hole of the shift selector lever.

3. Using a 0.080 in. (2mm) diameter alignment pin, place it in the alignment holes of the neutral start switch and the shift selector lever.

NOTE: A No. 47 drill bit will substitute for the pin gauge.

4. Secure the switch body with the screws and pull out the pin.

NOTE: If the neutral safety switch does not perform satisfactorily after adjustment, replace it with a new one.

Except 1986-89 Vehicles with 71B Transmission

1. Unscrew the securing nut of the shift selector lever and the switch-to-transmission screws.

2. Position the shift selector to the N position (in vertical position and detent clicks).

3. Using a 0.16 in. (4mm) diameter

alignment pin, place it in the alignment holes of the neutral start switch and the shift selector lever.

4. Secure the switch body with the screws and pull out the pin.

NOTE: If the neutral safety switch does not perform satisfactorily after adjustment, replace it with a new one.

AUTOMATIC TRANSAXLE

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transaxle Assembly

REMOVAL & INSTALLATION

2WD Models

1. Disconnect the negative battery cable. Remove the battery and the bracket.

2. Remove the air duct.

3. Drain the cooling system. Disconnect the heater hose from the dash panel.

4. Disconnect the control cable and the throttle wire from the automatic transaxle.

5. Disconnect the electrical connectors and remove the starter.

6. Remove the halfshafts from the transaxle.

7. Remove the front exhaust tube.

8. Using a transmission jack, support the transaxle.

9. Remove the crossmember, the buffer rod and the rear mounting.

10. Remove the torque converter housing dust cover. Using a piece of chalk, matchmark the converter with the drive plate for reassembly; the unit was balanced at the factory. Remove the torque converter-to-drive plate (flywheel) bolts; using a wrench on the crankshaft pulley bolt, rotate the crankshaft to expose the hidden torque converter bolts.

11. Reinstall the center member to support the engine when removing the transaxle.

12. Insert a wooden block between the engine oil pan and the center member.

13. Remove the left side transaxle mount.

14. Remove the transaxle-to-engine bolts and lower the transaxle from the vehicle.

⊙ AT TO ENGINE
⊗ ENGINE (GUSSET) TO AT

View of the automatic transaxle-to-engine bolt torquing sequence—2WD Axcess

15. To install, reverse the removal procedures. Torque the transaxle-to-engine bolts to:

a. Bolts No. 1—29–33 ft. lbs. (39–44 Nm)

b. Bolts No. 2—29–33 ft. lbs. (39–44 Nm)

c. Bolts No. 3—22–30 ft. lbs. (30–40 Nm)

16. To complete the installation, reverse the removal procedures. Road test the vehicle.

4WD Models

1. Disconnect the negative battery cable. Remove the battery and the bracket.

2. Remove the air duct.

3. Drain the cooling system. Disconnect the heater hose from the dash panel.

4. Disconnect the control cable and the throttle wire from the automatic transaxle.

5. Disconnect the electrical connectors and remove the starter.

6. Remove the halfshafts from the transaxle.

7. Remove the front exhaust tube.

8. Matchmark the driveshaft U-joint and differential flange, then, disconnect them from the differential. If the driveshaft is equipped with a center bearing, remove the center bearing bracket-to-chassis bolts and the drive-shaft assembly. Plug the transfer case housing to keep the fluid from leaking out.

9. Remove the buffer rod.

10. Remove the torque converter housing dust cover. Using a piece of chalk, matchmark the converter with the drive plate for reassembly; the unit was balanced at the factory. Remove the torque converter-to-drive plate (flywheel) bolts; using a wrench on the crankshaft pulley bolt, rotate the crankshaft to expose the hidden torque converter bolts.

11. From under the intake manifold, remove the gusset-to-transfer case bolts.

12. Using a socket wrench and a long extension, remove the gusset-to-intake manifold bolts and the gusset.

13. Using a transmission jack, support the transaxle.

- ⊙ AT TO ENGINE
- ⊗ ENGINE TO AT

View of the automatic transaxle-to-engine bolt torquing sequence—4WD Axxess

14. Remove the rear transfer case mount and the left side transaxle mount.

15. Remove the transaxle-to-engine bolts and lower the transaxle/transfer case assembly from the vehicle.

16. To install, reverse the removal procedures. Torque the transaxle-to-engine bolts to:

- a. Bolts No. 1—29–33 ft. lbs. (39–44 Nm)
- b. Bolts No. 2—29–33 ft. lbs. (39–44 Nm)

17. To complete the installation, reverse the removal procedures. Road test the vehicle.

SHIFT LINKAGE ADJUSTMENT

1. Remove the center console.
2. Position the shift selector lever into the **P** range.
3. Connect the control cable end to the manual lever of the transaxle unit.
4. Move the selector lever from **P** to **1** range and return to **P**; make sure the lever can move smoothly and without sliding noise.
5. At the bottom of the shift lever, loosen the locknuts **Y** and **X**.
6. Make sure the manual lever on the transaxle is locked into the **P** range.
7. Adjust the locknut **X** until it touches the trunnion and tighten the locknut to 12–16 ft. lbs. (16–22 Nm).
8. Move the selector lever from **P** to **1** range; make sure the lever can move smoothly and without sliding noise.
9. Using grease, apply to the contact areas of the selector lever and the select rod.
10. Install the center console.

THROTTLE LINKAGE ADJUSTMENT

1. Loosen the throttle wire locknuts **A** and **B**.
2. With the throttle drum set at **P₁** (fully open), move the fitting **Q** fully in the **T** direction and tighten the **B** nut in the **U** direction.

View of the shift lever adjustment locknuts—Axxess

View of the throttle wire adjustment—Axxess

3. Loosen the **B** $2\frac{3}{4}$ – $3\frac{1}{4}$ turns in the **T** direction and tighten the **A** nut, securely.

4. Make sure the throttle wire stroke **L** is 1.54–1.69 in. (39–43mm) between full throttle and idle.

NOTE: Adjust the throttle wire stroke when the throttle wire/accelerator wire is installed. Place marks on the throttle wire to facilitate measuring the wire stroke.

5. If the throttle wire stroke is not adjusted, the following problems may arise:

- a. When full-open position **P₁** of the throttle drum is closer to the direction **T**, the kickdown range will greatly increase.
- b. When the full-open position **P₁** of the throttle drum is closer to the direction **U**, the kickdown range will not occur.

6. After properly adjusting the throttle wire, make sure the parting line is as straight as possible.

NEUTRAL SAFETY SWITCH ADJUSTMENT

The neutral safety switch is attached to the right, rear side of the cylinder head. The switch operates the back-up lights and controls the operation of the starter. The starter should only operate when the transmission is in **P** or **N**.

1. Loosen the neutral safety switch-to-engine bolts.
2. Position the shift selector to the **N** position (in vertical position and detent clicks).
3. Using a 0.16 in. (4mm) diameter alignment pin, place it in the alignment holes of the neutral start switch and the shift selector lever.
4. Secure the switch body with the screws and pull out the pin.

NOTE: If the neutral safety switch does not perform satisfactorily after adjustment, replace it with a new one.

PIN. DIA.
0.16 IN. (4MM)

Using a pin to align the neutral start safety switch—Axxess

TRANSFER CASE

Transfer Case Assembly

REMOVAL & INSTALLATION

Except Axxess

1. Disconnect the negative battery cable.
2. Raise safely support the vehicle.
3. Place a drain pan under the transmission and transfer case, remove the drain plug and drain the oil from the cases.
4. Using a piece of chalk, make alignment marks on the transfer case and differential flanges.
5. Remove the front driveshaft-to-differential nuts/bolts, the front differential-to-transfer case nuts/bolts. Remove the rear driveshaft-to-differential nuts/bolts, the rear differential-to-

transfer case nuts/bolts. Remove the differentials from the vehicle.

6. Remove the torsion bar springs from the front lower control arms.

7. Remove the crossmember-to-chassis bolts (located under the transfer case) and the crossmember.

8. From under the vehicle, remove the transfer control lever-to-transfer case nut, then, separate the lever from the transfer case.

9. Using a floor jack, support the transfer case.

10. Remove the transfer case-to-transmission bolts, move the transfer case rearward and lower it to the floor.

11. To install, reverse the removal procedures. Torque the transfer case-to-transmission bolts to 23–30 ft. lbs. (31–41 Nm), the transfer control lever-to-transfer case nut to 18–22 ft. lbs. (25–30 Nm), the crossmember-to-chassis bolt to 43–58 ft. lbs. (59–78 Nm). Refill the transfer case and transmission with new fluid.

Axxess

1. Disconnect the negative battery cable.

2. If equipped with a manual transaxle, remove the breather clamp from the transfer case.

3. Remove the transaxle/transfer case assembly from the vehicle.

4. Remove the transfer case-to-transaxle bolts and the transfer case.

To install:

5. Using multi-purpose grease, lubricate the transaxle's oil seal on the transfer case side.

6. Using sealant, apply it around the ring gear oil seal on the transfer case.

NOTE: Be careful not to damage the transaxle oil seal when inserting the spline portion of the transfer ring gear and placing the shaft into the transaxle.

7. Torque the transfer case-to-transaxle bolts to 22–30 ft. lbs. (30–40 Nm).

8. To complete the installation, reverse the removal procedures.

9. Refill the transfer case with gear oil.

10. Test the vehicle by performing the following procedures:

a. Position the vehicle so all 4 wheels are not touching the ground and are free to turn.

b. Position the transfer case into the 4WD position.

c. Make sure the rear wheels are turning.

NOTE: Never test drive the vehicle with the transfer case in the 2WD position.

11. Lower the vehicle.

Ⓜ (R): APPLY RECOMMENDED SEALANT

DRIVE AXLE

Halfshaft

REMOVAL & INSTALLATION

Except Axxess

Halfshaft are used only on vehicles equipped with 4WD.

1. Raise and safely support the vehicle.

2. Depress the brake pedal and remove the halfshaft-to-differential flange bolts.

KA24E

Exploded view of the halfshaft assembly used with the 2.4L engine – Pick-Up and Pathfinder

3. Remove the locking hub assemblies.

4. Remove the snapping and drive clutch. Disconnect the tie rod from the steering knuckle.

5. Remove the upper ball joint-to-upper control arm bolts.

6. Remove the lower shock absorber-to-lower control arm nut/bolt.

7. Remove the lower ball joint-to-lower control arm bolts; using a floor jack, support the lower control arm.

8. Remove the steering knuckle assembly with the halfshaft and secure the assembly in a vise.

9. Using a hammer and a block of wood, tap the halfshaft from the steering knuckle.

NOTE: Upon installation, apply chassis lube to all bearing surfaces, make sure the spacer is in place and adjust the halfshaft endplay (by using various thicknesses of snaprings) to 0.004–0.012 in.

10. To install, reverse the removal procedures. Torque the halfshaft-to-differential flange bolts to 25–33 ft. lbs. (34–44 Nm), the locking hub-to-wheel hub bolts to 18–25 ft. lbs. (25–34 Nm), the lower ball joint-to-lower control arm nuts/bolts to 35–45 ft. lbs. (47–61 Nm) and the upper ball joint-to-upper control arm bolts to 12–15 ft. lbs. (16–21 Nm).

Axxess

2WD MODELS

1. Remove the grease cap. Depress the brake pedal and remove the wheel bearing locknut.

2. Raise and safely support the vehicle. Remove the wheel assembly.

3. Remove the brake caliper-to-steering knuckle bolts and support the assembly on a wire; do not disconnect the pressure hose.

VG30E

Exploded view of the halfshaft assembly used with the 3.0L engine - Pick-Up and Pathfinder

Exploded view of the halfshaft assembly - 2WD Axxess

4. Remove the tie rod end-to-steering knuckle cotter pin and nut. Using a tie rod end removal tool, separate the tie rod end from the steering knuckle.

5. Turn the steering knuckle forward. Using a mallet, tap the halfshaft

from the hub; be sure to cover the boots with a shop cloth to prevent damaging them.

NOTE: If equipped with an automatic transaxle, remove the right halfshaft first.

6. If equipped with a support bearing, use a prybar to separate the right halfshaft from the transaxle.

7. If equipped with a manual transaxle, pry the right halfshaft from the transaxle.

8. If equipped with an automatic transaxle, insert a prybar through the transaxle, tap it with a mallet to tap the left halfshaft from the transaxle.

NOTE: It is a good idea to replace the halfshaft-to-transaxle seals when the halfshaft is removed.

9. To install the halfshaft, press it into the transaxle until the shaft and side gear mesh and the circular clip is seated.

10. To complete the installation, reverse the removal procedures. Torque the wheel bearing locknut to 174–231 ft. lbs. (235–314 Nm).

4WD MODELS

Front Halfshaft

1. Remove the grease cap. Depress the brake pedal and remove the wheel bearing locknut.

2. Raise and safely support the vehicle. Remove the wheel assembly.

3. Remove the brake caliper-to-steering knuckle bolts and support the assembly on a wire; do not disconnect the pressure hose.

4. Remove the tie rod end-to-steering knuckle cotter pin and nut. Using a tie rod end removal tool, separate the tie rod end from the steering knuckle.

5. Turn the steering knuckle forward. Using a mallet, tap the halfshaft from the hub; be sure to cover the boots with a shop cloth to prevent damaging them.

NOTE: If equipped with an automatic transaxle, remove the right halfshaft first.

6. If not equipped with a support bearing, use a prybar to separate the right halfshaft from the transaxle.

7. Remove the bearing support bolts and the right halfshaft from the vehicle.

NOTE: It is a good idea to replace the halfshaft-to-transaxle seals when the halfshaft is removed.

8. To install the halfshaft, press it into the transaxle until the shaft and side gear mesh and the circular clip is seated.

9. To complete the installation, reverse the removal procedures. Torque the wheel bearing locknut to 174–231 ft. lbs. (235–314 Nm).

Rear Halfshaft

1. Remove the grease cap, the cotter pin and loosen the wheel bearing locknut.

2. Raise and safely support the vehicle.

3. Using a drift and a hammer, lightly separate the halfshaft from the knuckle; be sure to drive it inward.

Exploded view of the halfshaft assembly—4WD Axxess

4. Using shop cloths, cover the halfshaft boots to prevent damaging them.

5. Remove the parallel link-to-knuckle bolt and the radius rods-to-knuckle bolts.

6. Pull the knuckle outward and remove the halfshaft from it.

7. While supporting the halfshaft, use a prybar to separate the halfshaft from the differential.

8. To install, insert the halfshaft into the differential until the circlip snaps into position.

9. To complete the installation, reverse the removal procedures. Torque the radius rods-to-knuckle bolts to 58–72 ft. lbs. (78–98 Nm), the parallel link-to-knuckle bolt to 58–72 ft. lbs. (78–98 Nm) and the hub nut to 174–231 ft. lbs. (235–314 Nm).

Driveshaft and U-Joints

REMOVAL & INSTALLATION

Except Axxess and Van

2WD MODEL WITH ONE PIECE DRIVESHAFT

1. Raise and safely support the vehicle.

2. Using a piece of chalk, make alignment marks on the differential-to-driveshaft flange.

3. Remove the driveshaft-to-differential flange bolts, lower the differential and pull it from the transmission.

4. To install, insert the sleeve yoke into the transmission, align the

matchmarks and reverse the removal procedures. Torque the driveshaft-to-differential flange nuts/bolts to 29–33 ft. lbs. (39–44 Nm) for model 3S63 or 58–65 ft. lbs. (78–88 Nm) model 3S80.

5. Lower the vehicle.

2WD MODEL WITH TWO PIECE DRIVESHAFT

1. Raise and safely support the vehicle.

2. Using a piece of chalk, make alignment marks on the differential-to-driveshaft flange.

3. Remove the driveshaft-to-differential flange nuts/bolts and the center bearing flange-to-chassis nuts/bolts.

4. Lower and remove the rear driveshaft from the vehicle.

5. Using a clean rag, plug the rear of the transmission to keep the oil from leaking out.

6. If necessary, separate the front section of the driveshaft from the rear section.

NOTE: Replace the transmission rear oil seal when the driveshaft is removed.

7. To install, align the matchmarks and reverse the removal procedures. Torque as follows:

Center bearing-to-chassis bolts to 12–16 ft. lbs. (16–22 Nm)

Driveshaft-to-differential flange nuts/bolts

Model 3S63—29–33 ft. lbs. (39–44 Nm)

Model 3S80—58–65 ft. lbs. (78–88 Nm)

8. If the center bearing was separated from the front driveshaft, torque as follows:

View of the rear drive and suspension assembly—4WD Axxess

Companion flange-to-front drive-shaft nut—174-203 ft. lbs. (235-275 Nm)

Rear driveshaft-to-center bearing flange nuts/bolts

Model 3S63—17-24 ft. lbs. (24-32 Nm)

Model 3S71H—29-33 ft. lbs. (39-44 Nm)

Model 3S80—58-65 ft. lbs. (78-88 Nm)

4WD MODEL FRONT DRIVESHAFT

1. Raise and safely support the vehicle.

2. Using a piece of chalk, make alignment marks on the front drive-shaft-to-front differential flange and the front driveshaft-to-transfer case flange.

3. Remove the front driveshaft-to-front differential flange nuts/bolts and the front driveshaft flange.

4. Remove the front driveshaft from the vehicle.

5. To install, align the matchmarks and reverse the removal procedures. Torque the front driveshaft-to-front differential flange and the front drive-

Exploded view of a typical 1-piece driveshaft—except Axxess

shaft-to-transfer case flange nuts/bolts to 29-33 ft. lbs. (39-44 Nm).

4WD MODEL WITH REAR DRIVESHAFT (ONE PIECE)

1. Using a piece of chalk, make

alignment marks on the rear drive-shaft-to-rear differential flange.

2. Remove the rear differential-to-driveshaft nuts/bolts.

3. Move the driveshaft rearward (disconnecting it from the transfer

Exploded view of a front driveshaft—except Axxess

case), be sure to plug the rear of the transfer case to keep the oil from leaking from it.

4. To install, use a new transfer case oil seal, align the matchmarks and reverse the removal procedures. Torque the driveshaft flange-to-differential flange nuts/bolts to 58-65 ft. lbs. (78-88 Nm).

4WD MODEL REAR DRIVESHAFT (TWO PIECE)

1. Raise and safely support the vehicle.

2. Using chalk, matchmark the driveshaft flange-to-differential flange and, if necessary, the driveshaft flange-to-center bearing flange.

3. Remove the driveshaft-to-differential flange bolts and the center bearing-to-chassis bolts, then, lower the differential from the vehicle.

4. If necessary, remove the driveshaft-to-center bearing flange bolts and the rear driveshaft.

5. If necessary, separate the center bearing flange from the front driveshaft.

6. To install, reverse the removal procedures. Torque as follows:

Front driveshaft-to-center bearing flange nut to 181-217 ft. lbs. (245-294 Nm)

Center bearing flange-to-rear driveshaft bolts to 58-65 ft. lbs. (78-88 Nm)

Center bearing-to-chassis bolts to 12-16 ft. lbs. (16-22 Nm)

Driveshaft-to-differential flange bolts to 58-65 ft. lbs. (78-88 Nm).

Van

1. Raise and safely support the vehicle.

2. Using a piece of chalk, make alignment marks on the differential-to-driveshaft flange so the driveshaft can be reinstalled in the same position.

3. Remove the driveshaft-to-differential flange nuts/bolts.

4. Lower and remove the driveshaft from the vehicle.

5. Using a clean rag, plug the rear of the transmission to keep the oil from leaking out.

NOTE: Replace the transmission rear oil seal when the driveshaft is removed.

6. To install, align the matchmarks and reverse the removal procedures. Torque the driveshaft-to-differential flange nuts/bolts to 29-33 ft. lbs. (39-44 Nm).

Exploded view of a typical 2-piece driveshaft—except Axxess

View of the driveshaft - Axxess

Axxess

The rear driveshaft is used only on vehicles equipped with 4WD.

1. Raise and safely support the vehicle.

2. Matchmark the driveshaft flange-to-differential flange and the driveshaft flange-to-transfer case flange.

3. Remove the driveshaft flange-to-differential flange bolts and the driveshaft flange-to-transfer case flange bolts.

4. Support the driveshaft.

5. Remove the front and rear center bearing bracket-to-chassis bolts and lower the driveshaft from the vehicle.

6. To install, align the matchmarks and reverse the removal procedures. Torque the driveshaft flange bolts to 25-33 ft. lbs. (34-44 Nm) and the front/rear center bearing bracket-to-chassis bolts to 26-30 ft. lbs. (35-41 Nm).

Rear Axle Shaft, Bearing and Seal

REMOVAL & INSTALLATION

Pick-Up

SINGLE REAR WHEELS

1. Block the front wheels. Raise and safely support the vehicle.

2. Using a floor jack, support the differential. Remove the rear wheel/tire assembly.

3. If equipped with rear drum brakes, perform the following procedures:

- Remove the brake drum.
- Disconnect the parking brake cable from the brake shoes.
- Disconnect and plug the brake tube from wheel cylinder.

d. Remove the brake shoe assembly.

4. If equipped with rear disc brakes, perform the following procedures:

- Disconnect the parking brake cable from the caliper.
- Remove the caliper-to-knuckle bolts and suspend the caliper on a wire.
- Remove the rotor disc.

5. From the rear of the backing plate, remove the backing plate-to-axle housing nuts.

6. Using the rear axle stand tool

and the slide hammer puller, pull the axle shaft/backing plate assembly from the axle housing.

NOTE: When the axle shaft has been removed, the oil seal should be replaced.

7. To replace the wheel bearing, perform the following procedures:

a. At the rear of the backing plate, unbend and discard the lockwasher.

b. Using a brass drift and a hammer, loosen and remove the locknut.

c. Using a shop press, press the axle shaft from the backing plate and the bearing from the shaft.

d. Remove the seal and the bearing cup.

8. To install the wheel bearing assembly, perform the following procedures:

a. Using a new oil seal, lubricate the seal lips and install the new bearing cup.

b. Grease the area between the seal and cup.

c. Place the bearing cage and spacer onto the axle shaft, then, fit the bearing, tapping it into place with a soft drift and light hammer blows.

d. Place the flat bearing lockwasher over the locknut and install a new locknut. Torque the locknut to 108 ft. lbs. (147 Nm).

Exploded view of the rear axle assembly - single rear wheels - Pick-Up and Pathfinder

Exploded view of the rear axle assembly—dual rear wheels—Pick-Up 1986-88

e. Continue tightening until grooves align with the lockwasher tabs; the nut can be tightened to 145 ft. lbs. (196 Nm).

f. Bend the lockwasher tabs into place.

g. Lubricate the bearing and recess in the axle housing with wheel bearing grease. Coat the axle splines with gear oil. Coat the seal surface of the shaft with grease.

9. Using a dial indicator, adjust the axle shaft endplay using shims between the backing plate and the axle housing. The endplay should be 0.0008–0.0059 in. (servicing one axle) or 0.0118–0.0354 in. (1st axle) and 0.0008–0.0059 in. (2nd axle).

10. To complete the installation, reverse the removal procedures. Torque the backing plate-to-axle housing nuts to 39–46 ft. lbs. (53–63 Nm). Adjust the axle shaft endplay. Bleed the brake system.

DUAL REAR WHEELS

1. Block the front wheels. Raise and safely support the rear of the vehicle.

2. Using a floor jack, support the differential. Remove the rear wheel/tire assembly.

3. Remove the brake drum. Discon-

nect the parking brake cable from the brake shoes.

4. Disconnect and plug the brake tube from wheel cylinder.

5. From the rear of the backing plate, remove the backing plate-to-axle housing nuts.

6. Using the rear axle stand tool and the slide hammer puller, pull the axle shaft/backing plate assembly from the axle housing.

NOTE: When the axle shaft has been removed, the oil seal should be replaced.

7. Remove the attaching screws and detach the lockwasher from the rear wheel bearing nut.

8. Remove the rear wheel bearing nut.

9. Using a brass drift, drive out the bearing and seal.

To install:

10. Using 90W gear oil, lubricate the axle shaft splines and the oil seal lips.

11. Install new bearing races with an installation drift and pack the hub with chassis lube.

12. Pack each bearing and O-ring with chassis lube.

13. Install the bearings and axle shaft; be careful not to damage the

seal with the shaft. Always use new seals. Make sure the axle shaft endplay is 0.08mm.

14. Torque the wheel bearing locknut to 123–145 ft. lbs. (167–196 Nm), the backing plate nuts to 62–80 ft. lbs. (84–108 Nm) and the wheel hub studs to 181–217 ft. lbs. (245–294 Nm).

15. To adjust the endplay, perform the following procedure:

a. Turn the wheel hub (in both directions) several times.

b. Loosen the locknut.

c. Retorque the locknut to 0.4–1.1 ft. lbs., then, turn the wheel hub (in both directions) several times.

d. Retorque the locknut to 0.4–1.1 ft. lbs.

e. Using a dial indicator, measure the wheel bearing axial endplay; it should be zero play.

f. Using a spring gauge connected at 90 degrees to a wheel stud, measure and record the 1st wheel hub turning force.

g. Torque the locknut another 15–30 degrees and turn the wheel hub (in both directions) several times, then, measure and record the 2nd wheel hub turning force.

h. Subtract the 1st measurement from the 2nd measurement; the re-

sult is the preload force which should be 1.59–4.72 lbs.

i. If the correct preload force is not obtained, repeat the adjustment procedure until the correct force is obtained.

Van

1. Block the front wheels. Raise and safely support the vehicle.
2. Using a floor jack, support the differential. Remove the rear wheel/tire assembly.
3. Remove the brake drum. Disconnect the parking brake cable from the brake shoes.
4. Disconnect and plug the brake tube from wheel cylinder.
5. From the rear of the backing plate, remove the backing plate-to-axle housing nuts.
6. Using the rear axle stand tool and the slide hammer puller, pull the axle shaft/backing plate assembly from the axle housing.

NOTE: When the axle shaft has been removed, the oil seal should be replaced.

7. To install, lubricate the oil seal lips and reverse the removal procedures. Torque the backing plate-to-axle housing nuts to 33–40 ft. lbs. Bleed the brake system.

8. Adjust the endplay by performing the following procedures:

- a. Using a dial indicator, measure the axle shaft endplay; it must be 0–0.004 in.
- b. If not, select the correct shim thickness.
- c. Install the shim(s) between the rear axle bearing cage and the axle housing.

9. To complete the installation, reverse the removal procedures.

Front Wheel Hub, Knuckle and Bearings

REMOVAL & INSTALLATION

Except Axxess and Van

2WD MODELS

1. Raise and safely support the vehicle.
2. Remove the front wheels.
3. Disconnect the brake hose from the knuckle at the bracket.
4. Remove the brake caliper and suspend it on a wire.
5. Remove the wheel hub cup, the cotter pin, the adjusting cap and hub nut.
6. Remove the wheel hub and rotor assembly.
7. Remove the hub from the rotor assembly.

Exploded view of the rear axle assembly—Van

8. Remove the outer bearing cover with fingers and the inner bearing cove by prying out the grease seal. Discard the seal.

9. If it is necessary to replace the bearing outer race, drive it out from the hub with a brass drift and mallet. Evenly, tap the bearing outer race through the hole inside the hub.

10. Remove the baffle plate.

11. Loosen but do not remove the upper and lower ball joint tightening nut.

12. Separate the upper and lower ball joint from the knuckle spindle.

13. Using a jack, raise the lower control arm (link) and remove the ball joint tightening nut.

14. Separate the knuckle spindle from the upper and lower control arms (links).

15. Using a brass bar, drive the inside wheel bearing race and grease seal from the wheel hub.

16. Invert the wheel hub, then, drive the outside wheel bearing race from the wheel hub.

17. Remove the needle bearing and grease seal from the rear of the steering knuckle.

18. Clean all of the parts in solvent and blow dry with compressed air.

19. Inspect the parts for damage and/or wear; if necessary, replace the damaged parts.

Exploded view of the front wheel assembly — 2WD Pick-Up and 2WD Pathfinder 1986-88

To install:

20. Using the bearing outer race driver kit tool, drive the new bearing races into the wheel hub until they seat. Using multi-purpose grease, pack the inside of the wheel hub.

21. Force multi-purpose grease into each wheel bearing. Place the inside wheel bearing into the rear of the wheel hub, then, lubricate the new grease seal lips with grease and drive it into the wheel hub until it is flush with the wheel hub.

22. At the rear of the steering knuckle, lubricate and replace the needle bearing assembly. Install a new grease seal.

23. To install, reverse the removal procedures, except for the following exceptions:

a. While jacking up the lower link, install the knuckle spindle to the upper and lower ball joints.

b. When installing the knuckle arm, torque the retaining bolts to 53-72 ft. lbs.

c. Install the front hub wheel bearings.

d. When attaching the disc rotor to the hub, torque the bolts to 36-51 ft. lbs.

24. Torque the wheel bearing locknut to 58-72 ft. lbs.

25. Loosen the wheel bearing locknut and retorque it to 58-72 ft. lbs.

NOTE: Before checking the wheel bearing preload, make sure the brake pads are not touching the brake disc.

26. Turn the wheel hub several times in both directions. Using a spring scale, measure the wheel bearing preload; it should be 1.59-4.72 lbs.

27. If the preload force is too light, turn the locknut 15-30 degrees and recheck the preload force.

NOTE: Repeat this procedure until the correct preload force is met.

28. When the correct preload force is met, bend the lockwasher tab to secure the locknut.

29. To complete the installation, reverse the removal procedures. Check and/or adjust the front end alignment.

4WD MODELS

1. Raise and safely support the vehicle. Remove the front wheel assembly.

2. Remove the calipers and suspend them on a wire, out of the way.

3. Remove the auto-lock or manual-lock free running hub assembly.

4. Using a pair of snapping pliers, remove the snapping from the halfshaft.

5. Separate the halfshaft from the

Exploded view of the front wheel assembly — 2WD Pathfinder 1989-90

steering knuckle by tapping on the end of the shaft.

6. At the tie rod end, remove the cotter pin and loosen the tie rod-to-steering knuckle nut. Using the ball joint removal tool, separate the tie rod from the steering knuckle.

7. Loosen, but do not remove the upper and lower ball joint-to-knuckle nuts.

8. Using a ball joint removal tool, separate the upper and lower ball joints from the steering knuckle; be sure not to remove the ball joint nuts.

9. Support the lower control arm with a floor jack and remove the ball joint nuts.

10. Remove the steering knuckle from the upper/lower control arms.

11. Using a small pry bar, remove the snapring and lockwasher from the front wheel hub.

12. Using the locknut wrench socket, remove the locknut from the front wheel hub.

13. Separate the front wheel hub/rotor disc from the steering knuckle.

14. Separate the front wheel hub from the brake rotor.

15. Inspect the wheel bearings; if necessary, replace them.

16. When installing, refer to the following notes:

a. When installing the needle bearing into the knuckle spindle, apply multi-purpose grease and make sure the needle bearing is facing in the proper direction.

b. With the lower control arm jacked up, install the knuckle spindle to the upper and lower ball joints.

c. Adjust the wheel bearing preload.

d. When installing the axle shaft, never reuse the snapring, and check the axial endplay.

17. To install, reverse the removal procedures. Torque as follows:

Steering knuckle arm-to-steering knuckle bolts—53–72 ft. lbs.

Upper ball joint-to-upper control arm nuts/bolts—12–15 ft. lbs.

Lower ball joint-to-lower control arm nuts/bolts—28–38 ft. lbs.

Upper ball joint-to-steering knuckle nut—58–108 ft. lbs.

Lower ball joint-to-steering knuckle nut—87–123 ft. lbs.

Wheel bearing locknut—58–72 ft. lbs.

Locking hub assembly—18–25 ft. lbs.

18. Adjust the wheel bearing preload.

Van

1. Remove the hub cap and loosen the wheel bearing locknut.

2. Raise and safely support the vehicle.

Exploded view of the front wheel assembly—4WD Pick-Up and 4WD Pathfinder

3. Remove the brake caliper-to-steering knuckle bolts and suspend the caliper on a wire; do not disconnect the pressure hose.

4. Remove the wheel bearing nut, the lockwasher and the wheel hub.

5. Remove the tie rod end-to-steering knuckle cotter pin and nut. Using a tie rod end removal tool, separate the tie rod end from the steering knuckle.

6. Loosen both the upper/lower ball joints-to-control arms nuts; do not remove the nuts.

7. Using a ball joint removal tool, separate the ball joints from the control arms.

8. Remove the ball joint nuts and the steering knuckle from the vehicle.

9. Remove the circular clip from the wheel hub.

10. Using a shop press, press the wheel bearing from the wheel hub.

To install:

11. Using a new wheel bearing assembly, press it into the wheel hub un-

til it seats; do not force the wheel bearing beyond 3 tons.

12. Install the circular clip into the wheel hub.

13. Using a new seal, lubricate the seal lips with grease and press it into the wheel hub until it is flush with the hub.

14. Install the steering knuckle and torque as follows:

Upper ball joint-to-steering knuckle nut—40–72 ft. lbs. (54–98 Nm)

Lower ball joint-to-steering knuckle nut—124–141 ft. lbs. (169–191 Nm)

Tie rod end-to-steering knuckle nut—40–72 ft. lbs. (54–98 Nm).

15. Install the wheel hub and torque the wheel hub locknut to 195–260 ft. lbs. (265–353 Nm).

16. Using a dial indicator, check the axial play; it should be 0.0020 in. (0.05mm) or less.

17. To complete the installation, reverse the removal procedures. Inspect the front wheel alignment.

Exploded view of the front wheel assembly - Van

Axxess**2WD MODELS**

1. Remove the grease cap, the cotter pin, the adjusting cap and insulator.
2. Apply the brakes and loosen the wheel bearing locknut.
3. Raise and safely support the vehicle.
4. Remove the brake caliper-to-steering knuckle bolts and suspend the caliper on a wire; do not disconnect the pressure hose.
5. Remove the tie rod end-to-steering knuckle cotter pin and nut. Using a tie rod end removal tool, separate the tie rod end from the steering knuckle.
6. Using a hammer and a drift, tap the halfshaft from the wheel hub.
7. Remove the lower ball joint-to-control arm nuts and the steering knuckle-to-strut nuts/bolts.
8. Remove the steering knuckle from the vehicle.
9. Using a shop press, press the wheel hub from the steering knuckle.
10. Using a shop press, press the bearing race from the wheel hub and remove the grease seal.
11. Using a pry bar, pry the grease seal from the steering knuckle.
12. Remove the inner and outer snaprings from the steering knuckle.
13. Using a shop press, press the outer bearing race from the steering knuckle.
14. Clean and inspect the parts.

To install:

15. Install the inner snapring into the groove in the steering knuckle.

16. Using a shop press, press a new wheel bearing into the steering knuckle; do not exceed 3 tons pressure.

17. Using multi-purpose grease, pack the grease seal lip.

18. Install the outer snapring into the groove of the steering knuckle.

19. Press the grease seals into the steering knuckle.

20. Using a shop press, press the wheel hub into the steering knuckle; do not exceed 3 tons pressure.

21. To check the bearing preload, increase the shop press pressure to 3.5-5.0 tons and spin the knuckle several times in both directions; make sure the wheel bearings operate smoothly.

22. Install the steering knuckle; be sure to insert the halfshaft into the wheel hub. Torque the steering knuckle-to-strut nuts/bolts to 82-91 ft. lbs. (112-124 Nm), the lower ball joint-to-transverse link nuts to 56-80 ft. lbs. (76-109 Nm).

23. Torque the wheel hub locknut to 174-231 ft. lbs. (235-314 Nm). Using a dial indicator, measure the bearing axial endplay; it should be 0.0020 in. (0.05mm) or less.

Exploded view of the front wheel assembly - Axxess

24. To complete the installation, reverse the removal procedures. Inspect the front wheel alignment.

Rear Wheel Hub, Knuckle and Bearings

REMOVAL & INSTALLATION

Axxess

2WD MODELS

The rear knuckle and wheel spindle are a part of the rear strut and must be replaced as an assembly.

1. Remove the hub cap and cotter pin.
2. Apply the brakes and loosen the wheel bearing locknut.
3. Raise and safely support the vehicle. Remove the wheel assembly.
4. Remove the wheel bearing nut, washer and wheel hub bearing.

NOTE: The wheel hub bearing must be replaced as an assembly, if the bearing is defective.

5. To install, reverse the removal procedures. Torque the wheel hub bearing assembly to 137-188 ft. lbs. (186-255 Nm).

6. Using a dial indicator, measure the bearing axial endplay; it should be 0.0020 in. (0.05mm) or less.

7. To complete the installation, reverse the removal procedures. Inspect the rear wheel alignment.

4WD MODELS

1. Remove the hub cap, cotter pin, the adjusting cap and insulator.

2. Apply the brakes and loosen the wheel bearing locknut.

3. Raise and safely support the vehicle. Remove the wheel assembly.

4. Remove the wheel bearing nut and washer.

5. Disconnect the hydraulic line from the wheel cylinder and parking brake cable from the brake shoes.

6. Using shop cloths, cover the halfshaft boots.

7. Using a mallet, tap the halfshaft to separate it from the wheel hub.

8. Remove the radius rods-to-knuckle bolts and the parallel link-to-knuckle bolt.

9. Support the knuckle and remove the strut-to-knuckle nuts and bolts. Remove the knuckle assembly from the vehicle and position the assembly in a vise.

10. Using a piece of pipe and a hammer, drive the wheel hub from the knuckle.

11. Using a shop press, press the outside, inner race from the wheel hub and remove the grease seal.

12. Drive the inside, inner race from

Exploded view of the rear wheel assembly - 2WD Axxess

Exploded view of the rear wheel assembly - 4WD Axxess

the knuckle and remove the grease seal.

13. Remove the inner and outer snaprings.

14. Drive the bearing outer race from the knuckle.

15. Clean and inspect the parts.

To install:

16. Install the inner snapring into the groove in the knuckle.

17. Using a shop press, press the new wheel bearing assembly into the knuckle.

18. Using multi-purpose grease, pack the lip of the new grease seals.

19. Install the outer snapring into the groove of the knuckle.

20. Install both grease seals.

21. Using a shop press, press the

wheel hub into the knuckle; do not exceed 3 tons pressure.

22. To check the bearing preload, increase the shop press pressure to 3.5-5.0 tons and spin the knuckle several times in both directions; make sure the wheel bearings operate smoothly.

23. Install the knuckle; be sure to insert the halfshaft into the wheel hub. Torque as follows:

Strut-to-knuckle nuts/bolts - 82-91 ft. lbs. (112-124 Nm)

Radius rods-to-knuckle nut/bolt - 58-72 ft. lbs. (78-98 Nm)

Parallel rod-to-knuckle nut/bolt - 58-72 ft. lbs. (78-98 Nm).

24. Install the parking brake cable and the pressure line to the wheel cylinder.

25. Torque the wheel hub locknut to 174–231 ft. lbs. (235–314 Nm). Using a dial indicator, measure the bearing axial endplay; it should be 0.0020 in. (0.05mm) or less.

26. To complete the installation, reverse the removal procedures. Inspect the rear wheel alignment.

Manual Locking Hubs

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. Remove the wheels.
3. Set the knob of the manual lock to the **FREE** position.
4. Using a Torx® wrench, remove the locking hub cover while the brake pedal is depressed.
5. Remove the snapring and pull out the drive clutch.
6. Install the drive clutch and snapring; make sure the hub is in the **FREE** position.
7. Install the hub cover and tighten the bolts to 18–25 ft. lbs. (25–34 Nm).
8. Install the wheels, remove the stands and lower the vehicle.

Automatic Locking Hubs

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. Remove the wheels.
3. Set the knob of the auto lock to the **FREE** position.
4. Using a Torx® wrench, remove the locking hub cover while the brake pedal is depressed.
5. Remove the snapring.
6. Remove washer **B**, washer **A** and brake **B**.
7. Make sure the hub is in the **FREE** position and install washer **B**, washer **A** and brake **B**.
8. Install the snapring.
9. Install the hub cover and torque the bolts to 18–25 ft. lbs. (25–34 Nm).
10. Install the wheels, remove the stands and lower the vehicle.

Pinion Seal

REMOVAL & INSTALLATION

Pick-Up and Pathfinder

The pinion oil seal on Models H190A, H233B and C200 differentials must not be replaced for they use a collapsible spacer.

1. Raise and safely support the vehicle.
2. Remove the driveshaft.

Exploded view of the manual-lock free-running hub—4WD Pick-Up and 4WD Pathfinder

Exploded view of the auto-lock free-running hub—4WD Pick-Up and 4WD Pathfinder

3. Using a socket wrench and the differential flange holding tool, hold the differential flange and the remove the differential pinion nut.

4. Using a wheel puller tool, pull the pinion flange from the differential.

5. Using a small pry bar, pry the oil seal from the differential.

6. Using the oil seal driver tool (Model R180A and H190A differentials), lubricate the new oil seal lips with multi-purpose grease and drive the new seal into the differential housing until it is flush the end of the housing.

7. Using a soft hammer, tap the pinion flange onto the pinion shaft.

8. Using a socket wrench and the differential flange holding tool (Model H233B), hold the differential flange and torque the pinion flange nut as follows:

Model R180—123–145 ft. lbs.

Model R190A—94–217 ft. lbs.

Model H233B—145–181 ft. lbs.

9. To complete the installation, reverse the removal procedures.

Van

1. Raise and safely support the vehicle. Remove the driveshaft.

2. Using a socket wrench and the differential flange holding tool, hold the differential flange and the remove the differential pinion nut.

3. Using a wheel puller tool, pull the pinion flange from the differential.

4. Using a small pry bar, pry the oil seal from the differential.

5. Using the oil seal driver tool, lubricate the new oil seal lips with multi-purpose grease and drive the new seal into the differential housing until it is flush the end of the housing.

6. Using a soft hammer, tap the pinion flange onto the pinion shaft.

7. Using a socket wrench and the differential flange holding tool, hold the differential flange and torque the pinion flange nut to 94 ft. lbs.

8. Turn the pinion flange, in both directions, several times to set the bearings. Using a small torque wrench, measure the pinion preload; it should be 9.5–14.8 inch lbs. If the preload value is not obtained, repeat the pinion torquing procedure.

Axxess

4WD MODELS

1. Raise and safely support the vehicle.

2. Remove the driveshaft.

3. Using a spanner wrench and a socket wrench, remove the drive pinion nut.

4. Using a wheel puller tool, press the companion flange from the differential.

5. Using an oil seal remover tool, press the oil seal from the differential.

To install:

6. Using a new oil seal, lubricate it with multi-purpose grease.

7. Using an oil seal installation tool, drive the new oil seal into the differential.

8. Install the companion flange and torque the drive pinion nut to 123–145 ft. lbs. (167–196 Nm).

9. Install the driveshaft and lower the vehicle.

Differential Carrier

REMOVAL & INSTALLATION

Pick-Up and Pathfinder (4WD)

FRONT

1. Raise and safely support the vehicle. Drain the differential.

2. Separate the halfshafts from the front differential.

3. Remove the front driveshaft from the front differential and transfer case.

4. Remove the front engine mounting bolts and raise the engine.

5. Support the differential assembly.

6. Remove the differential crossmember-to-chassis bolts and lower the differential with the crossmember. Remove the assembly from the vehicle.

7. Remove differential-to-crossmember bolts and the crossmember.

View of the front differential assembly – 4WD Pick-Ups and 4WD Pathfinder

8. To install, reverse the removal procedures. Torque the differential-to-front insulator bracket nut/bolt to 50–64 ft. lbs., the differential-to-front crossmember nuts to 50–64 ft. lbs. Inspect the front differential oil level.

9. Install the front driveshaft and halfshafts. Lower the vehicle.

REAR

Except Models C200 Differential

1. Raise and safely support the vehicle.

2. Disconnect the driveshaft from the differential carrier.

3. Drain all fluid from the differential carrier and remove the axle shafts.

4. Remove the differential carrier-to-axle housing bolts and the carrier.

5. Install the differential carrier and torque the bolts to 12–18 ft. lbs. (17–25 Nm); be sure the gasket on the H233B model is installed in the correct position.

6. Install the axle shafts and connect the driveshaft.

7. Lower the vehicle and fill the differential with gear oil.

Axxess

A differential carrier is used only with 4WD models.

1. Raise and safely support the vehicle.

2. Remove the driveshaft. Separate the halfshafts from the differential carrier.

3. Disconnect the breather hose from the differential carrier.

4. Using a floor jack, support the differential carrier.

5. Remove the differential mounting insulator-to-chassis bolt and the differential carrier-to-crossmember bolts.

6. If necessary, remove the differen-

tial crossmember-to-chassis bolts and the crossmember.

7. Lower the differential carrier from the vehicle.

8. To install, reverse the removal procedures. Torque the differential mounting insulator-to-chassis bolt to 43–58 ft. lbs. (59–78 Nm) and the differential carrier-to-crossmember bolts to 43–58 ft. lbs. (59–78 Nm).

9. Connect the driveshaft and halfshafts. Lower the vehicle.

Axle Housing

REMOVAL & INSTALLATION

Pick-Up and Pathfinder

1. Block the front wheels.

2. Raise and safely support the vehicle. Using a floor jack, position it under the differential and support its weight.

3. Remove the rear wheel/tire assemblies.

4. Using a piece of chalk, make alignment marks on the driveshaft and differential flanges. Remove the driveshaft-to-differential flange nuts/bolts and separate the driveshaft from the differential.

5. If equipped drum brakes, remove the brake drum and disconnect the parking brake cable from the brake assembly. If equipped with disc brakes, disconnect the parking brake cable from the caliper.

6. Disconnect and plug the brake line from the wheel cylinders or calipers. Disconnect the brake line from the differential clips.

7. Remove the lower shock absorber-to-rear spring pad nut and separate the shock absorber from the rear spring pad.

Exploded view of the differential carrier assembly – 4WD Axxess

8. Remove the rear spring pad-to-differential (U-bolt) nuts, the U-bolts and the spring pads.

9. With the rear differential disconnected from the vehicle, move the floor jack to pass it out through either side of the vehicle; pass it out above the springs.

10. To install, reverse the removal procedures. Torque as follows:

Differential-to-rear spring pad (U-bolts) nuts—65–72 ft. lbs.

Lower shock absorber-to-rear spring pad nut—22–30 ft. lbs.

Driveshaft-to-differential flange nuts/bolts—25–33 ft. lbs.

11. Adjust the parking brake. Bleed the rear brake system.

Van

1. Block the front wheels.

2. Raise and safely support the vehicle. Using a floor jack, position it under the differential and support its weight.

3. Remove the rear wheel/tire assemblies.

4. Using a piece of chalk, make alignment marks on the driveshaft and differential flanges. Remove the driveshaft-to-differential flange nuts/bolts and separate the driveshaft from the differential.

5. Remove the brake drum and disconnect the parking brake cable from the brake assembly.

6. Disconnect and plug the main brake line from the differential junction block.

7. Remove the sway bar-to-chassis nuts/bolts and the sway bar-to-differential nuts/bolts and the sway bar from the vehicle.

8. Remove the upper shock absorber-to-chassis nut from inside the vehicle.

View of the typical rear axle assembly—Pick-Up and Pathfinder

View of the rear axle assembly—Van

NOTE: The upper shock absorber nuts are located inside the vehicle.

9. Remove the panhard rod-to-chassis nut/bolt and lower the rod.

10. Remove the upper and lower links-to-chassis nuts/bolts, then, separate the links from the chassis supports.

11. Lower the differential. Remove the coil spring assemblies and the differential from the vehicle.

12. To install, temporarily tighten all of the links, lower the vehicle to the ground, bounce the vehicle several times and reverse the removal procedures. Torque as follows:

Lower and upper links-to-chassis nuts/bolts—80–94 ft. lbs.

Shock absorber-to-chassis nuts/bolts—12–18 ft. lbs.

Panhard rod-to-chassis nut/bolt—80–94 ft. lbs.

Sway bar-to-chassis nuts/bolts—10–14 ft. lbs.

Sway bar-to-differential—5.8–7.2 ft. lbs.

Driveshaft-to-differential nuts/bolts—25–33 ft. lbs.

STEERING

Steering Wheel

REMOVAL & INSTALLATION

1. Position the steering wheel in the straight ahead position.

2. Disconnect the negative battery cable.

3. Remove the horn pad by unscrewing the screws from the rear of the steering wheel crossbar.

4. Matchmark the top of the steering column shaft and the steering wheel flange.

5. Remove the attaching nut and remove the steering wheel with a puller.

NOTE: Do not strike the shaft with a hammer, for the steering column to collapse.

6. Install the steering wheel so the punchmarks are aligned. Torque the steering wheel nut to 22–29 ft. lbs. (29–39 Nm).

7. Install the horn pad and connect the negative battery cable.

Manual Steering Gear

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

View of the manual steering gear—Pick-Up and Pathfinder

Adjusting the manual steering worm gear preload—Pick-Up and Pathfinder

Tightening the manual steering worm gear nut—Pick-Ups and Pathfinder

2. Remove the steering gear-to-rubber coupling bolt.

3. Matchmark the pitman arm and sector shaft and with the wheels in a straight ahead position, remove the idler arm-to-sector shaft nut.

4. Using the steering gear arm puller tool, press the arm from the steering gear.

5. Remove the steering gear-to-chassis bolts and the steering gear from the vehicle.

6. To install, reverse the removal procedures. Torque as follows:

Steering gear-to-coupling bolt—17–22 ft. lbs. (24–29 Nm)

Steering gear-to-pitman arm nut—94–108 ft. lbs. (127–147 Nm)

Steering gear-to-frame bolts—62–71 ft. lbs. (84–96 Nm)

ADJUSTMENT

Worm Gear Preload

For this procedure, the steering gear must be removed from the and placed in a vise.

1. Using the locknut wrench tool, loosen the locknut.

2. Rotate the worm shaft a few times (in both directions) to settle the worm bearing and check the preload.

3. Using the adjusting plug wrench, the torque wrench and an adapter socket, check the worm bearing preload; it should be 1.7–5.2 inch lbs. (0.20–0.59 Nm).

4. If necessary to adjust the worm gear preload, turn the adjusting plug and recheck the preload.

5. With the worm gear preload set, use the adjusting plug wrench, and the locknut wrench, hold the adjusting plug and tighten the locknut.

Steering Gear Preload

1. Loosen the adjusting screw locknut.

2. Rotate the worm shaft a few times (in both directions) to settle the worm bearing and check the preload.

3. Set the worm gear in the straight ahead position.

4. Using the torque wrench tool and an adapter socket, check the worm gear preload; it should be 7.4–10.9 inch lbs. (0.83–1.23 Nm) for new parts or 5.2–8.7 inch lbs. (0.59–0.98 Nm) for used parts.

5. If necessary, use a screwdriver, then, turn the adjusting screw to obtain the correct preload.

6. With the preload set, tighten the adjusting screw nut.

Adjusting the manual steering gear preload—Pick-Ups and Pathfinder

Power Steering Gear

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Remove the wormshaft-to-rubber coupling bolt.

3. Matchmark the idler arm and

sector shaft and with the wheels in a straight ahead position, remove the idler arm-to-sector shaft nut.

4. Disconnect the fluid lines from the gear, then, cap the lines and openings in the gear.

5. Using the steering gear arm puller, press the gear arm from the steering knuckle.

6. Remove the steering gear-to-chassis bolts and the steering gear from the vehicle.

7. To install, reverse the removal procedures. Torque as follows:

Steering gear coupling bolt—17–22 ft. lbs. (49–51 Nm)

Steering gear-to-pitman arm nut—101–130 ft. lbs. (137–177 Nm)

Steering gear-to-frame bolts—62–71 ft. lbs. (84–96 Nm).

8. Refill the power steering pump reservoir and bleed the system.

ADJUSTMENT

1. Remove the power steering gear and position it in a vise.

2. Loosen the adjusting screw locknut.

3. Set the worm gear in the straight ahead position.

4. Using the torque wrench and an adapter socket, check the turning torque; it should be 0.9–3.5 inch lbs. (0.1–0.4 Nm).

5. If necessary, use a screwdriver, then, turn the adjusting screw to obtain the correct preload.

6. With the preload set, tighten the adjusting screw nut.

Power Steering Rack

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Remove the wheel assemblies.

3. Remove the tie rod-to-steering knuckle cotter pins and nuts. Using a tie rod end separator tool, separate the tie rod ends from the steering knuckles.

4. Remove the rubber coupling-to-steering rack pinch bolt.

5. Disconnect and plug the power steering lines from the steering rack.

6. Remove the power steering rack-to-chassis bracket bolts and the brackets.

7. Remove the power steering rack from the vehicle.

8. To install, reverse the removal procedures. Torque the power steering rack-to-chassis bracket bolts to 54–72 ft. lbs. (73–97 Nm), the tie rod end-to-steering knuckle nuts to 22–29 ft. lbs. (29–39 Nm); be sure to install new cotter pins.

9. Using new O-rings, install the

power steering pressure lines to the steering rack.

10. Refill the power steering pump reservoir and bleed the system.

11. Lower the vehicle.

ADJUSTMENT

The power steering rack must be removed from the vehicle and positioned in a vise.

1. Without fluid in the rack, set the gears in the neutral position.

2. Lubricate the adjusting screw with locking sealant and screw it in.

3. Lightly, tighten the locknut.

4. Torque the adjusting screw to 43–52 inch lbs. (4.9–5.9 Nm).

5. Loosen the adjusting screw and retorque it to 0.43–1.74 inch lbs. (0.05–0.20 Nm).

6. Move the rack over its entire stroke several times.

7. Using an inch lb. torque wrench, measure the pinion rotating torque within the range of 180 degrees from the neutral position.

8. Loosen the adjusting screw and retorque it to 43–52 inch lbs. (4.9–5.9 Nm).

9. Loosen the adjusting screw 40–60 degrees.

10. While securing the adjusting screw in position, torque the locknut to 29–43 ft. lbs. (39–59 Nm).

11. Using a spring gauge, connect it to the tie rod end, pull the tie rod to check the frictional sliding force; it should be 27.6–37.5 lbs. (122.6–166.7 N) at neutral point or 27.6–41.9 lbs. (122.6–186.3 N) other than neutral point.

Power Steering Pump

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the drive belt from the power steering pump.

3. Place a container under the power steering pump, then, disconnect/plug the pressure lines and drain the fluid into the container.

4. Remove the power steering pump-to-engine bolts and the pump from the vehicle.

5. To install, reverse the removal procedures. Adjust the drive belt tension. Bleed the power steering system.

BELT ADJUSTMENT

1. Loosen the drive belt adjustment screw.

2. Inspect and adjust the belt deflection:

Axxess

Used belt—0.24–0.28 in. (6–7mm)

New belt—0.20–0.24 in. (5–6mm)

Pick-Up and Pathfinder

2.4L Engine

Used belt—0.35–0.43 in. (9–11mm)

New belt—0.28–0.35 in. (7–9mm)

2.5L Engine

Used belt—0.55–0.63 in. (14–16mm)

New belt—0.47–0.55 in. (12–14mm)

3.0L Engine

Used belt—0.43–0.51 in. (11–13mm)

New belt—0.35–0.43 in. (9–11mm)

Van

Used belt—0.35–0.39 in. (9–10mm)

New belt—0.28–0.35 in. (7–9mm)

3. Adjust the correct belt tension and retorque the adjusting bolt locknut.

SYSTEM BLEEDING

1. Raise and support the vehicle safely.

2. Check and add fluid to the reservoir, if necessary.

3. Start the engine. Turn the steering wheel quickly (all the way), right and left, just touching the stops; turn the steering wheel at least 10 times.

NOTE: When bleeding the system, make sure the temperature of the fluid reaches 140–176°F (60–80°C).

4. Stop the engine, then, check and/or add more fluid.

5. Start and run the engine for 3–5 seconds.

6. Stop the engine, then, check and/or add more fluid.

7. Start the engine. Turn the steering wheel (all the way) right and left, just touching the stops; turn the steering wheel at least 10 times.

8. Stop the engine, then, check and/or add more fluid.

9. Repeat the steps until all of the air is bleed from the system.

10. If the air cannot be bleed from the system, turn and hold the steering wheel at each stop for at least 5 seconds but never more than 15 seconds.

Tie Rod Ends

REMOVAL & INSTALLATION

Except Axxess

1. Raise and safely support the ve-

hicle. Remove the wheel/tire assembly.

2. If removing the tie rod as an assembly, perform the following procedure:

a. Remove the tie rod-to-cross rod cotter pin (discard it) and nut.

b. Remove the tie rods-to-steering knuckle cotter pin (discard it) and nut.

c. Using the ball joint remover tool, press the tie rod from the steering knuckle and the tie rod from the cross rod.

3. If removing a defective tie rod end, perform the following procedure:

a. Remove the tie rod-to-cross rod/steering knuckle cotter pin (discard it) and nut.

b. Loosen the tie rod end-to-tie rod clamp or locknut.

c. Using the ball joint remover tool, press the tie rod from the cross rod/steering knuckle and the tie rod from the cross rod/steering knuckle.

d. Measure the tie rod end-to-tie rod clamp distance.

e. Unscrew the tie rod end from the tie rod.

f. Using a new tie rod end, screw the new tie rod end into the tie rod clamp until the measured distance is the same, then, torque the tie rod clamp bolt to 10-14 ft. lbs. (14-20 Nm) or nut to 58-72 ft. lbs. (78-98 Nm).

4. Inspect the tie rod ball joint for wear; if necessary, replace it.

5. To install, use new cotter pins and reverse the removal procedures. Torque the tie rod-to-steering knuckle nut to 40-72 ft. lbs. (54-98 Nm) and the tie rod-to-cross rod nut to 40-72 ft. lbs. (54-98 Nm). Check and/or adjust the front-end alignment.

Axxess

1. Raise and safely support the vehicle.

2. Remove the wheel assembly.

3. Remove the tie rod end-to-steering knuckle cotter pin and nut. Using a tie rod removal tool, separate the tie rod end from the steering knuckle.

Exploded view of the steering linkage assembly—2WD Pick-Up and 2WD Pathfinder

Exploded view of the steering linkage assembly—4WD Pick-Up and 4WD Pathfinder

Exploded view of the steering rack assembly—Axxess

Exploded view of the steering linkage assembly—Van

4. Loosen the tie rod-to-tie rod end locknut.

5. While counting the number of turns, remove the tie rod end from the tie rod.

6. To install, screw the tie rod end onto the tie rod the same number of turns necessary to remove it.

7. Install the tie rod end into the steering knuckle. Torque as follows:

Tie rod end-to-steering knuckle nut—22-29 ft. lbs. (29-39 Nm)

Tie rod end-to-tie rod locknut

2WD—27-34 ft. lbs. (37-46 Nm)

4WD—58-72 ft. lbs. (78-98 Nm)

8. To complete the installation, reverse the removal procedures. Check and or adjust the front wheel alignment.

4. If equipped, disconnect the level warning switch connector from the master cylinder.

5. Remove the master cylinder mounting bolts, by performing one of the following procedures:

a. If not equipped with power brakes, remove the master cylinder-to-cowl bolts and the clevis pin from the brake pedal. Remove the master cylinder.

b. If equipped with power brakes, remove the master cylinder-to-power booster nuts and the master cylinder assembly from the power brake unit.

6. To install, reverse the removal

procedures. Torque the master cylinder nuts to 6-8 ft. lbs. and the brake lines-to-master cylinder to 11-13 ft. lbs. Refill the master cylinder with new brake fluid and bleed the brake system.

NOTE: Before tightening the master cylinder mounting nuts or bolts, screw the hydraulic line fitting into the cylinder body a few turns.

Load Sensing Proportioning Valve

The purpose of this valve is to control the fluid pressure applied to the brakes to prevent rear wheel lock-up during weight transfer at high speed stops.

REMOVAL & INSTALLATION

1. Raise and safely support the rear of the vehicle.

2. Disconnect and plug the lines going to the valve.

3. Remove the valve-to-chassis bolts and the valve.

4. To install, reverse the removal procedures.

5. Bleed the brake system.

ADJUSTMENT

Pick-Up and Pathfinder

1986-89

1. Position approximately 220 lbs. of weight over the rear axle.

BRAKES

For all brake system repair and service procedures not detailed below, please refer to "Brakes" in the Unit Repair section.

Master Cylinder

NOTE: Be careful not to spill brake fluid on the painted surfaces of the vehicle; it will damage the paint.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Using a syringe, remove the brake fluid from the master cylinder.

3. Disconnect and plug the hydraulic lines at the master cylinder.

Exploded view of the master cylinder—Pick-Up and Pathfinder

Exploded view of the Axxess master cylinder—Van is similar

2. Install pressure gauges at the front and rear brakes.

3. Depress the brake pedal until the front brake is approximately 711 lbs. Check that the rear brake pressure is 327-469 lbs.

4. Depress the brake pedal until the front brake pressure is approximately 1422 lbs. Check that the rear brake pressure is 455-654 lbs.

5. If the rear brake pressure is not within specifications, move the spring bracket to the left if the pressure is high or to the right if the pressure is low. Repeat this process until the rear brake pressure is correct.

1990

1. Ensure the fuel tank, the cooling system and the engine crankcase are filled. Make sure the spare tire, the jack, the hand tools and the mats are installed.

2. Position a person sit in the driver's seat and one on the rear end; then, have the person on the rear end, slowly, get off.

3. Attach a lever to the stopper bolt and adjust the length L to approx. 7.44 in. (189mm).

4. Install pressure gauges at the front and rear brakes.

5. Depress the brake pedal until the front brake is approximately 1422 lbs. Check that the rear brake pressure is 327-441 lbs.

6. Slowly, set a 220 lb. weight on the rear axle.

7. Depress the brake pedal until the front brake pressure is approximately 1422 lbs. Check that the rear brake pressure is 711-995 lbs. for except heavy duty or 640-924 for heavy duty.

8. If the rear brake pressure is above specification, adjust the bracket in the L direction.

9. If the rear brake pressure is be-

Exploded view of the load sensing valve
Pick-Up and Pathfinder

Adjusting the load sensing valve "L" length—Pick-Up and Pathfinder

low specification, adjust the bracket in the R direction.

Adjusting the load sensing valve to proper specification—Pick-Up and Pathfinder

Axxess

1. Position a person sit in the driver's seat and position 1544 lbs. over the rear axle.

2. Install pressure gauges at the front and rear brakes.

3. Bleed the air from the front and rear brake lines.

4. Depress the brake pedal until the front brake is approximately 711 lbs. Check that the rear brake pressure is 455-597 lbs. for 2WD, 5 passenger model, 412-555 for 2WD, 7 passenger model, 370-512 lbs. for 4WD, 5 passenger model, 341-483 for 4WD, 7 passenger model.

5. Depress the brake pedal until the front brake pressure is approximately 1422 lbs. Check that the rear brake pressure is 455-597 lbs. for 2WD, 5 passenger model, 412-555 for 2WD, 7 passenger model, 370-512 lbs. for 4WD, 5 passenger model, 341-483 for 4WD, 7 passenger model.

6. If the rear brake pressure is above specification, adjust the bracket in the A direction.

7. If the rear brake pressure is below specification, adjust the bracket in the B direction.

8. If necessary, repeat the pressure procedure.

9. If the pressure is outside the specified range after the spring length is adjusted, replace the load sensing valve assembly.

Power Brake Booster

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the master cylinder from the power brake booster.

3. Remove the vacuum hose from the power brake booster.

4. Working under the instrument panel, remove the brake pedal-to-brake booster rod clevis pin. Remove the power brake booster mounting bolts and the booster from the vehicle.

View of the load sensing valve—Axxess

View of the load sensing valve—2WD
Axxess

View of the load sensing valve—4WD
Axxess

5. To install, reverse the removal procedures. Torque the power brake booster-to-cowl nuts to 5.8–8 ft. lbs. (8–11 Nm). Check and/or adjust the brake pedal height.

NOTE: When installing the power brake booster, make sure there is a little clearance between the pushrod end and the master cylinder piston; 0.40–0.41 in.

Brake Caliper

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the wheel assembly.

2. Remove the disc brake pads from the caliper.

3. Disconnect and plug the brake hose from the brake caliper.

4. Remove the caliper-to-caliper support bolt and the caliper from the vehicle.

5. To install, reverse the removal procedures. Torque the brake caliper-to-caliper support bolt to 53–72 ft. lbs. (72–97 Nm) except rear disc brakes or 28–38 ft. lbs. (38–52 Nm) rear disc brakes.

6. Bleed the brake system.

CL28VA

Exploded view of the single piston front disc brake assembly—Pick-Up and Pathfinder

Disc Brake Pads

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the wheel/tire assembly.

2. Remove the bottom caliper-to-caliper support bolt and swing the caliper upward.

3. Remove the pad retainers, the inner/outer retainers and the brake pads.

4. Using a medium C-clamp and a block of wood, place the wood against the caliper piston(s), then, using the C-clamp press the piston into the caliper; this procedure is to make clearance for the new brake pads.

5. Inspect the caliper for signs of fluid leakage; if necessary, replace or rebuild the caliper.

6. To install, use new brake pads and reverse the removal procedures. Torque the brake caliper-to-caliper support bolt to 53–72 ft. lbs. (72–97 Nm) except rear disc brakes or 28–38 ft. lbs. (38–52 Nm) rear disc brakes.

Front Brake Rotor

REMOVAL & INSTALLATION

Pick-Up and Pathfinder

2WD

1. Raise and safely support the vehicle. Remove the wheel assembly.

2. Remove the calipers; do not disconnect the brake hose. Using a wire, suspend the calipers from the vehicle.

3. Remove the caliper support-to-steering knuckle bolts and the caliper support.

CL28VD

Exploded view of the dual piston front disc brake assembly—Pick-Up, Pathfinder and Van

Exploded view of the single piston front disc brake assembly—Axxess

Exploded view of the single piston rear disc brake assembly—Pick-Up and Pathfinder

4. Remove the wheel bearing grease cup, cotter pin, adjusting nut cap, hub nut, thrust washer and wheel bearing.

5. Pull the wheel hub/brake rotor assembly from the wheel spindle.

6. From the rear of the brake rotor, remove the rotor-to-wheel hub bolts and the rotor.

7. Inspect the rotor for cracks, wear and/or other damage; if necessary, replace it.

8. To install, use a new cotter pin and reverse the removal procedures. Torque the rotor-to-wheel hub bolts to 36-51 ft. lbs. and the wheel hub-to-spindle nut to 25-29 ft. lbs. Adjust the front wheel bearing preload. Check and/or adjust the front wheel alignment.

4WD

1. Raise and support the front of the vehicle safely under the axle case. Remove the wheel/tire assembly.

2. If equipped with a manual/free-running lock assembly, perform the following procedure:

a. Remove the lock assembly-to-hub Torx® bolts.

b. Pull the lock assembly from the wheel hub.

c. From the halfshaft, remove the snapping and the drive clutch.

3. If equipped with a automatic/free-running lock assembly, perform the following procedure:

a. Remove the lock assembly-to-hub Torx® bolts.

b. Pull the lock assembly (with brake A) from the wheel hub.

c. From the halfshaft, remove the

snapping, the washers and the brake B.

4. From the halfshaft, remove the thrust washer, the snapping and the lockwasher.

NOTE: To remove the lockwasher (4WD models), remove the lockwasher-to-locknut screw(s).

5. Using the locknut socket wrench, remove the locknut from the halfshaft.

6. Pull the wheel hub/rotor assembly from the steering knuckle.

7. Remove the rotor-to-wheel hub bolts and the rotor.

8. To install, reverse the removal procedures. Torque as follows:

Rotor-to-wheel hub bolts—36-51 ft. lbs.

Lockwasher-to-locknut screw(s)—9-14 inch lbs.

Wheel hub/rotor assembly-to-halfshaft—58-72 ft. lbs.

Free-running hub assembly-to-wheel hub Torx® bolts—18-25 ft. lbs.

9. Check and/or adjust the front wheel alignment.

VAN

1. Raise and safely support the vehicle.

2. Remove the calipers; do not disconnect the brake hose. Using a wire, suspend the calipers from the vehicle.

3. Remove the caliper support-to-steering knuckle bolts and the caliper support from the vehicle.

4. Remove the wheel bearing grease cup, the hub nut and the lockwasher.

5. Pull the wheel hub/brake rotor assembly from the wheel spindle.

6. Inspect the rotor for cracks, wear and/or other damage; if necessary, replace it.

7. To install, reverse the removal procedures. Torque the rotor/wheel hub assembly-to-spindle nut to 195-260 ft. lbs. Adjust the front wheel bearing.

Axxess

1. Raise and safely support the front of the vehicle.

2. Remove the wheel assembly.

3. Remove the brake caliper assembly and suspend it on a wire.

4. Remove the brake caliper support-to-steering knuckle bolts and the support.

5. Remove the rotor from the wheel hub.

6. To install, reverse the removal procedures.

Rear Brake Rotor

REMOVAL & INSTALLATION

Pick-Up and Pathfinder

1. Raise and safely support the vehicle.

2. Remove the wheel assembly.

3. Remove the brake caliper assembly and suspend it on a wire.

4. Remove the brake caliper support-to-steering knuckle bolts and the support.

5. Remove the rotor from the hub.

6. To install, reverse the removal procedures.

Brake Drums

REMOVAL & INSTALLATION

Front

1. Raise and safely support the vehicle. Remove the wheel assembly.

2. Remove the axle hub grease cap.

3. Remove the cotter pin and loosen the hub nut. When the nut is close to the end of the spindle, pull the drum and hub assembly outward. If it does not slide off the brake shoes, loosen the brake shoe adjuster star wheels. Remove the spindle nut, the brake drum/hub, the washer and the wheel bearings.

NOTE: Be careful not to get foreign matter in the wheel bearings. The heavy coating of grease will hold many particles. These will damage the bearing.

4. Inspect and/or replace the brake drum.

5. To install, reverse the removal procedures. Adjust the wheel bearing preload.

Rear

1. Raise and safely support the vehicle.
2. Remove the wheel assembly.
3. Pull the brake drum from the wheel hub.
4. Inspect and/or replace the brake drum.
5. To install, reverse the removal procedures.

Brake Shoes**REMOVAL & INSTALLATION**

1. Raise and safely support the vehicle. Remove the wheel assembly.
2. Remove the brake drum.
3. Using a pair of pliers, remove the brake shoe hold-down anti-rattle spring retainers. Depress the retainer while rotating it 90 degrees to align the slot in the retainer with the flanged end of the pin. Remove the retainers, springs, spring seats and pins.
4. Move the brake shoes outward against the return springs and remove the parking brake extension link.
5. Disconnect the brake shoe return springs.
6. Remove the brake shoes from the backing plate. The secondary (after) brake shoe must be disconnected from the parking brake toggle lever after withdrawing the toggle lever clevis pin.
7. Remove the rubber boot from behind the brake backing plate and slide the adjuster shim, lockplate and adjuster springs off the back of the adjuster assembly. Remove the adjuster assembly from the backing plate.
8. Clean the backing plate and adjuster assembly so they are free of all dust and dirt.
9. Check the wheel cylinders.

To install:

10. Apply brake grease to the adjuster assembly housing bore, the adjuster wheel and the adjuster screw. Assemble the adjuster assembly with the adjuster screw turned all the way in. Apply brake grease to the sliding surfaces of the adjuster assembly, the brake backing plate and the retaining spring. Install the adjuster assembly to the backing plate.

NOTE: On 4WD models, after install the crank lever on the backing plate, make sure there is no play between the crank lever and the backing plate when pulling the crank lever. If play exists, adjust the bolt A and locknut A.

11. Before assembling the brake shoes to the backing plate, apply grease to the following areas: the brake shoe grooves in the parking

brake extension link, the inside surfaces of the anti-rattle (retaining) spring seats and the contact surfaces between the brake backing plate and the brake shoes.

12. Assemble the secondary (after) brake shoe to the parking brake toggle lever and adjust the clearance between the toggle lever and the brake shoe.

13. Assemble the brake shoes to the backing plate. Measure the inner diameter of the brake drum and the outer diameter of the shoes. The shoe outer diameter should be 0.0098–0.0157 in. (0.25–0.40mm) less than the drum inner diameter; if not, adjust it by rotating the star wheel adjuster.

14. Install the brake drum and the wheel.

15. Bleed the brakes, if necessary.

16. Adjust the shoe-to-drum clearance by operating the parking brake lever several times.

Parking Brake Shoes

Rear parking brake shoes are used in combination with rear disc brakes.

REMOVAL & INSTALLATION**Pick-Up and Pathfinder**

1. Fully, release the parking brake.
2. Raise and safely support the vehicle. Remove the wheel assembly.
3. Remove the brake caliper, the brake caliper support and the brake disc/drum assembly.

Exploded view of the rear disc/drum parking brake assembly—Pick-Up and Pathfinder

NOTE: If the disc/drum is difficult to remove, insert 2–8mm x 1.25 screws in the disc/drum holes, tighten the screws to press the disc/drum from the hub.

4. Remove the brake shoe retainers and the springs.

5. Separate the parking brake cable from the from the parking brake lever.

6. Using brake grease, lubricate the shoe adjuster and the backing plate contact points.

7. Turn the shoe adjuster all the way inward.

8. To install, reverse the removal procedures. Adjust the parking brakes by turning the adjuster wheel.

ADJUSTMENT

1. Make sure the parking brake lever is fully released.
2. From the rear of the backing plate, remove the adjuster hole plug.
3. Using a small prybar, rotate the adjuster wheel until the shoe touches the brake drum.
4. Back off the adjuster wheel 7–8 latches.
5. Install the adjuster hole plug.
6. Make sure there is no drag between the shoes and the brake drum when rotating the disc rotor.

Wheel Cylinder**REMOVAL & INSTALLATION**

1. Raise and safely support the rear of the vehicle.

2. Remove the wheel, brake drum and brake shoes.

3. Disconnect the brake tube from the rear of the wheel cylinder.

4. Remove the wheel cylinder-to-backing plate bolts and the wheel cylinder from the backing plate.

5. To install, reverse the removal procedures. Torque the wheel cylinder-to-backing plate nuts to bolt to 3.9–5.4 ft. lbs. Bleed the brake hydraulic system.

Parking Brake Cable

REMOVAL & INSTALLATION

Rear Cable(s)

1. Fully release the parking brake control lever.

2. Raise and safely support the vehicle.

3. Loosen the adjusting nut at the adjuster cable lever.

4. Disconnect the cable from the balance lever or adjuster.

5. Disconnect the rear parking brake cable(s) from the parking brake toggle levers of the rear service brake assemblies.

6. Remove the rear parking brake cable brackets-to-chassis bracket screws.

7. Remove parking brake cable(s) from the vehicle.

8. To install, reverse the removal procedures. Apply a light coat of grease to the cables to make sure that they slide properly. Torque the parking brake cable bracket screws to 5.8–8 ft. lbs. Adjust the parking brake cables.

Front Cable

1. Fully release the parking brake control lever.

2. Raise and safely support the vehicle.

3. Loosen the adjusting nut at the adjuster cable lever.

4. Disconnect the cable from the balance lever or adjuster.

5. Remove the front cable bracket-to-chassis bolt(s) and the cable from the vehicle.

6. To install, reverse the removal procedures. Apply a light coat of grease to the cable to make sure it slides properly. Torque the front cable bracket-to-chassis bolt, if equipped to 5.8–8 ft. lbs. Adjust the parking brake cables.

ADJUSTMENT

1. Raise and safely support the vehicle.

2. Adjust the rear brakes.

3. From under the vehicle, adjust

the parking brake cable locknut(s). Turn the adjusting nut until the parking brake control lever operating stroke is (using 44 lbs. force):

10–12 clicks—console lever—Pick-Up and Pathfinder

10–12 clicks—stick lever—2WD Pick-Up and 2WD Pathfinder

9–11 clicks—stick lever—4WD Pick-Up and 4WD Pathfinder

7–9 clicks—Van

8–9 clicks—2WD Axxess®

10–11 clicks—4WD Axxess

4. Release the parking brake and make sure the rear wheels turn freely with no drag.

5. Lower the vehicle.

FRONT SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

Except Axxess

1. Raise and safely support the vehicle. Remove the wheel assembly.

2. While holding the upper stem of the shock absorber, remove the shock absorber-to-chassis nut (Pick-Up and Pathfinder) or nut/bolt (Van), washer and rubber bushing.

3. Remove the lower shock absorber-to-lower control arm nut/bolt (Pick-Up and Pathfinder) or nut (Van) and the shock absorber from the vehicle.

4. To install, use new rubber bushings and reverse the removal procedures. Torque the shock absorber-to-lower control arm nut/bolt to 43–58 ft. lbs. and the shock absorber-to-chassis nut to 12–16 ft. lbs. (Pick-Up and Pathfinder) or nut/bolt to 22–30 ft. lbs. (Van).

MacPherson Strut

REMOVAL & INSTALLATION

Axxess

1. Raise and safely support the vehicle; position support under the front of the frame.

2. Remove the wheel assembly.

3. Matchmark the strut-to-steering knuckle position.

4. Remove the strut-to-steering knuckle nut/bolts.

5. Remove the strut-to-chassis nuts and the strut from the vehicle.

6. To install, reverse the removal procedures. Align the strut-to-steering

knuckle matchmarks. Torque the strut-to-chassis nuts to 33–40 ft. lbs. (44–54 Nm) and the strut-to-steering knuckle nuts/bolts to 82–91 ft. lbs. (112–124 Nm).

7. Check and/or adjust the front end alignment.

Leaf Springs

REMOVAL & INSTALLATION

Van

1. Raise and safely support the vehicle; position supports under the frame.

2. Remove the wheel assembly.

3. Remove the lower control arm from one side.

4. From the opposite side, loosen the leaf spring-to-lower control arm bolt.

5. Remove the leaf spring by sliding it from the opposite lower control arm.

6. Inspect the spring for wear and/or cracks; if necessary, replace the spring.

7. To install, reverse the removal procedures.

Torsion Bars

REMOVAL & INSTALLATION

Pick-Up and Pathfinder

2WD MODELS

1. Block the rear wheels. Raise and safely support the front of the vehicle with supports placed under the frame. Remove the wheel assemblies.

2. Remove the torsion bar spring adjusting nut.

3. Remove the dust cover and the snapping from the anchor arm.

4. Pull the anchor arm off rearward and remove the torsion bar spring.

5. Remove the torque arm.

To install:

6. Check the torsion bars for wear, cracks or other damage; replace them if they are suspected.

7. Install the torque arm on the lower link (control arm) and torque the bolts to 37–50 ft. lbs. (50–68 Nm).

8. Install the snapping and dust cove on the torsion bar.

9. Coat the splines on the inner end of the torsion bar with chassis lube and install it into the torque arm. The torsion bars are marked **L** and **R** and are not interchangeable.

10. Position a floor jack under the lower link and raise it so the clearance between the link and the rebound bumper is 0.

11. Install the anchor arm so the dimension **G** is 0.24–0.71 in. (6–18mm).

12. Install the snapping to the anchor

Exploded view of the front suspension system—Van

arm and dust cover. Make sure the snapping is properly installed in the groove of the anchor arm.

13. Tighten the anchor arm adjusting nut until dimension **L** is 1.38 in. (35mm) for heavy duty, cab/chassis and std models or 1.93 in. (49mm) for all other models.

14. Lower the vehicle so it is resting on the wheels and bounce it several times to set the suspension. Turn the anchor bolt adjusting nut so dimension **H** is 4.37-4.53 in. (111-115mm) for 1986-87 models or 4.25-4.65 in. (108-118mm) on 1988-90 models.

4WD MODELS

1. Block the rear wheels. Raise and safely support the front of the vehicle with supports placed under the frame.

2. Remove the torsion bar spring adjusting nut.

3. Pull back the dust boot and remove the anchor arm snapping.

Location of the torsion bar adjustment nut—2WD Pick-Up and 2WD Pathfinder

4. Remove the torque arm attaching nuts and withdraw the torsion bar spring forward with the torque arm still attached.

5. Check the torsion bar for wear, cracks or other damage; replace them, if they are suspected.

View of the torsion bar serrated ends. Note they are marked and are not interchangeable—Pick-Up and Pathfinder

To install:

6. Coat the splines on the torsion bar with chassis lube and install it in the anchor arm. The torsion bars are marked **L** and **R** and are not interchangeable.

7. Position a floor jack under the

Adjusting the torsion bar anchor arm length—2WD Pick-Up and 2WD Pathfinder

Torquing the torsion bar anchor arm bolt to length—2WD Pick-Up and 2WD Pathfinder

Adjusting the vehicle ride height—2WD Pick-Up and 2WD Pathfinder

lower link (control arm) and raise it so the clearance between the link and the rebound bumper is 0.

8. Install the anchor arm so the dimension **G** is 1.97–2.36 in. (50–60mm).

9. Install the snapping on the anchor arm and pull the dust boot over it.

10. Tighten the anchor arm adjusting nut until dimension **L** is 3.03 in. (77mm).

11. Lower the vehicle so it is resting on the wheels and bounce it several times to set the suspension. Turn the anchor bolt adjusting nut so dimension **H** is 1.73–1.89 in. (44–48mm) for 1986–87 or 1.61–2.01 in. (41–51mm) for 1988–90.

Upper Ball Joints

INSPECTION

Except Axxess

The ball joint(s) should be replaced

Location of the torsion bar adjustment nut—4WD Pick-Up and 4WD Pathfinder

Adjusting the torsion bar anchor arm length—4WD Pick-Up and 4WD Pathfinder

Torquing the torsion bar anchor arm bolt to length—4WD Pick-Up and 4WD Pathfinder

Adjusting the vehicle ride height—4WD Pick-Up and 4WD Pathfinder

when play becomes excessive. The manufacturer does not publish specifications on just what constitutes excessive play, relying instead on a method of determining the force (in inch lbs.) required to keep the ball joint turning. An effective way to determine ball joint play is to raise the vehicle until

the wheel is just a few inches off the ground and the ball joint is unloaded, which means not to jack directly under the ball joint. Place a long bar under the tire and move the wheel and tire assembly up and down; place one hand on top of the tire while you are doing this. If there is over 1/4 in. of play at the top of the tire, the ball joint is probably bad. This assuming that the wheel bearings are in good shape and properly adjusted. As a double check, have someone watch the ball joint while you move the tire up and down with the bar. If considerable play is seen, besides feeling play at the top of the wheel, the ball joints need to be replaced.

REMOVAL & INSTALLATION

Except Axxess

1. Raise and safely support the vehicle.

2. Remove the wheel/tire assembly.

NOTE: On the Pick-Up and Pathfinder, it may be necessary to loosen the torsion bar anchor lock and adjusting nuts to relieve spring tension.

3. Place a floor jack under the steering knuckle and support it.

4. Remove and discard the cotter pin from the ball joint stud, then, loosen the nut. Using the ball joint removal tool, press the upper ball joint from the lower control arm. Remove the upper ball joint nut.

5. Remove the upper ball joint-to-upper control arm bolts and the ball joint from the vehicle.

6. To install, use a new ball joint, a new cotter pin and reverse the removal procedures. Torque as follows:

Upper ball joint-to-upper control arm bolts—12–16 ft. lbs.

Upper ball-to-steering knuckle nut
Pick-Up and Pathfinder—58–108 ft. lbs.

Van—40–72 ft. lbs.

7. Check and/or adjust the ride height and the front end alignment.

Lower Ball Joints

INSPECTION

The ball joint(s) should be replaced when play becomes excessive. The manufacturer does not publish specifications on just what constitutes excessive play, relying instead on a method of determining the force (in inch lbs.) required to keep the ball joint turning. An effective way to determine ball joint play is to raise the vehicle until the wheel is just a few inches off the ground and the ball joint is unloaded,

which means not to jack directly under the ball joint. Place a long bar under the tire and move the wheel and tire assembly up and down; place one hand on top of the tire while you are doing this. If there is over 1/4 in. of play at the top of the tire, the ball joint is probably bad. This assuming that the wheel bearings are in good shape and properly adjusted. As a double check, have someone watch the ball joint while you move the tire up and down with the bar. If considerable play is seen, besides feeling play at the top of the wheel, the ball joints need to be replaced.

REMOVAL & INSTALLATION

The lower control arm ball joint on the 2WD Pick-Up and 2WD Pathfinder models are not removable; if the ball joint is defective, replace the lower control arm.

1. Raise and safely support the vehicle.
2. Remove the wheel/tire assembly.

NOTE: On the Pick-Up and Pathfinder, loosen the torsion bar spring anchor lock and adjusting nuts and remove the anchor arm bolt from the anchor arm. Remove the snapping, then move the anchor arm and torsion bar fully rearward. This procedure is to relieve the spring pressure on the lower control arm.

3. If equipped, it may be necessary to disconnect the sway bar from the lower arm.

4. Disconnect the tension rod from the lower arm.

5. Remove the cotter pin, discard it, from the ball joint stud and loosen the nut.

6. Using the ball joint separator tool, press the ball joint from the steering knuckle.

7. Remove the lower ball joint-to-lower control arm bolts and the ball joint.

8. To install, use a new cotter pin and reverse the removal procedures. Torque as follows:

Ball joint-to-control arm bolts
4WD Pick-Up and 4WD Pathfinder—35–45 ft. lbs.

Axxess—56–80 ft. lbs.

Ball joint-to-steering knuckle nut
Pick-Up and Pathfinder—87–141 ft. lbs.

Axxess—52–64 ft. lbs.

Van—124–141 ft. lbs.

9. Check and/or adjust the torsion bar ride height assembly and the front end alignment.

Upper Control Arms

REMOVAL & INSTALLATION

Pick-Up and Pathfinder

1. Raise and safely support the vehicle.
2. Remove the wheels.
3. Remove the upper shock absorber-to-chassis nut and compress the shock absorber.

NOTE: If may be necessary to loosen the torsion bar anchor lock and adjusting nuts to relieve the torsion bar tension.

4. Remove the upper ball joint-to-upper control arm bolts.

5. Using a floor jack, raise the lower control arm.

6. Remove the upper control arm-to-chassis bolts and the upper control arm from the vehicle.

NOTE: If shims are used, be sure to keep them in order for reinstallation purposes.

7. Inspect the ball joint, if necessary, replace it.

8. To install, replace the shims (if used) in their original locations and reverse the removal procedures. Torque the upper control arm-to-chassis bolts to 80–108 ft. lbs., the ball joint-to-upper control arm bolts to 12–15 ft. lbs. and the upper shock absorber-to-chassis nut to 12–16 ft. lbs. Lower the vehicle and adjust the ride height. Check and/or adjust the front end alignment.

Van

1. Raise and safely support the vehicle. Remove the wheel assembly.

2. Using a floor jack, support the lower control arm.

3. Remove the upper ball joint-to-upper control arm bolts and separate the ball joint from the upper control arm.

4. Remove the upper control arm-to-chassis bolts and the control arm from the vehicle.

NOTE: If shims are used, be sure to keep them in order for reinstallation purposes.

5. To install, replace the shims (if used) in their original locations and reverse the removal procedures. Torque the upper control arm-to-chassis bolts to 37–50 ft. lbs. and the upper ball joint-to-upper control arm bolts to 16–22 ft. lbs. Check and/or adjust the front end alignment.

Lower Control Arms

REMOVAL & INSTALLATION

Pick-Up and Pathfinder

2WD MODELS

1. Raise and safely support the vehicle.

2. Remove the wheel assembly.

3. Loosen the torsion bar spring anchor lock and adjusting nuts and remove the anchor arm bolt from the anchor arm.

4. Remove the snapping, then, move the anchor arm and torsion bar fully rearward.

5. Remove the lower shock absorber-to-lower control arm nut/bolt.

6. Disconnect the sway bar-to-lower control arm nut and separate the sway bar from the lower control arm.

7. Disconnect the tension rod-to-lower control arm bolts.

8. Remove and discard the cotter pin from the ball joint stud, then, remove the nut. Using the ball joint removal tool, press the ball joint from the knuckle spindle.

9. Remove the lower control arm-to-chassis nut/bolt, tap the pivot shaft from the bushing. Push down on the tension rod and remove the lower control arm.

10. To install, use a new cotter pin and reverse the removal procedures. Torque as follows:

Lower control arm-to-chassis nut/bolt—80–108 ft. lbs.

Tension rod-to-lower control arm bolt—36–47 ft. lbs.

Lower ball joint-to-lower control arm nut—87–141 ft. lbs.

Shock absorber-to-lower control arm nut/bolt—43–58 ft. lbs.

Sway bar-to-lower control arm nut—12–16 ft. lbs.

11. Check and/or adjust the torsion bar ride height assembly and the front end alignment.

4WD MODELS

1. Raise and safely support the vehicle.

2. Remove the wheel assembly.

3. Loosen the torsion bar spring anchor lock and adjusting nuts and remove the anchor arm bolt from the anchor arm.

4. Remove the snapping, then, move the anchor arm and torsion bar fully rearward.

5. Remove the lower shock absorber-to-lower control arm nut/bolt.

6. Disconnect the sway bar-to-lower control arm nut and separate the sway bar from the lower control arm.

7. Disconnect the compression rod-to-lower control arm bolts.

8. Remove and discard the cotter

pin from the ball joint stud, then, remove the nut. Using the ball joint removal tool, press the ball joint from the knuckle spindle.

9. Remove the lower control arm-to-chassis nut/bolt, tap the pivot shaft from the bushing. Push down on the compression rod and remove the lower control arm.

10. To install, use a new cotter pin and reverse the removal procedures. Torque as follows:

Lower control arm-to-chassis nut/bolt—80–108 ft. lbs.

Compression rod-to-lower control arm nut—87–108 ft. lbs.

Lower ball joint-to-lower control arm nut—87–141 ft. lbs.

Shock absorber-to-lower control arm nut/bolt—43–58 ft. lbs.

Sway bar-to-lower control arm nut—12–16 ft. lbs.

11. Check and/or adjust the torsion bar ride height assembly and the front end alignment.

Van

1. Raise and safely support the vehicle.

2. Remove the wheel/tire assembly.

3. From the lower ball joint, remove the cotter pin (discard it), then, loosen the lower ball joint nut (do not remove it).

4. Remove the tie rod-to-steering knuckle nut, then, install the nut upside-down (to prevent damage to the nut). Using the tie rod removal tool, press the tie rod from the steering knuckle.

5. Using a floor jack, support the steering knuckle assembly.

6. Disconnect the brake caliper from the steering knuckle and support it on a wire; do not disconnect the brake hose.

7. Remove the upper ball joint-to-upper control arm bolts.

8. Using the ball joint removal tool, press the lower ball joint from the lower control arm. Remove the lower ball joint nut and the steering knuckle from the vehicle.

9. Remove the sway bar brackets-to-lower control arm bolts and swing the sway down (away) from the lower control arm.

10. Remove the shock absorber-to-lower control arm nut and the compression rod-to-lower control arm bolts, then, separate the shock absorber and compression rod from the lower control arm.

11. Lower the floor jack to take the spring pressure off the lower control arm.

12. Remove the leaf spring-to-lower control arm nut and support rubber.

13. Remove the lower control arm-to-suspension crossmember nut/bolt and the lower control arm.

NOTE: When installing the leaf spring and spring support rubber, be certain the washer does not protrude beyond the end surface of the leaf spring.

14. To install, reverse the removal procedures. Torque as follows:

Lower control arm-to-suspension crossmember nut/bolt—80–101 ft. lbs.

Leaf spring-to-lower control arm nut—22–27 ft. lbs.

Sway bar-to-lower control arm bolt—23–31 ft. lbs.

Upper ball joint-to-upper control arm bolts—16–22 ft. lbs.

Lower ball joint-to-steering knuckle nut—124–141 ft. lbs.

Tie rod-to-steering knuckle nut—40–72 ft. lbs.

Compression rod-to-lower control arm bolts—22–30 ft. lbs.

Lower shock absorber-to-lower control arm nut—22–30 ft. lbs.

15. Check and/or adjust the front end alignment.

Sway Bar

REMOVAL & INSTALLATION

Pick-Up and Pathfinder

1. Raise and safely support the vehicle.

2. If equipped with a splash shield, remove it.

3. From both sides of the vehicle, remove the sway bar-to-lower control arm connecting rod nut, bushings and tube.

4. Remove the sway bar-to-chassis bracket bolts and brackets.

NOTE: On some vehicles, it may be necessary to remove the tension rod in order to remove the sway bar.

5. Remove the sway bar from the vehicle.

6. To install, reverse the removal procedures. Torque the sway bar-to-chassis bracket bolts to 12–16 ft. lbs. and the sway bar-to-lower control arm connecting rod nut/bolt to 16–22 ft. lbs.

Van

1. Raise and safely support the front of the vehicle.

2. From both sides of the vehicle, remove the sway bar-to-lower control arm bracket bolts and brackets.

3. Remove the sway bar-to-chassis bracket bolts, then, remove the sway bar from the vehicle.

4. Inspect the bushing for damage; replace them, if necessary.

5. To install, reverse the removal procedures. Torque the sway bar-to-chassis bracket bolts to 23–31 ft. lbs.

and the sway bar-to-lower control arm bracket bolts to 23–31 ft. lbs.

Axxess

A stabilizer bar is used on the 2WD models only.

1. Raise and safely support the front of the vehicle.

2. Remove the stabilizer bar-to-connecting rod nut.

3. Remove the stabilizer bar clamp-to-chassis bolts and the stabilizer bar from the vehicle.

4. To install, reverse the removal procedures. Torque the stabilizer bar clamp-to-chassis bolts to 23–31 ft. lbs. (31–42 Nm). and the stabilizer bar-to-connecting rod nuts to 30–38 ft. lbs. (41–51 Nm).

Front Wheel Bearings

For the FWD Axxess, the 4WD Pick-Up and 4WD Pathfinder models, please refer to the Drive Axle section.

Only the front wheel bearings require periodic service. The lubricant to use is high temperature disc brake wheel bearing grease meeting NLGI No.2 specifications. Special tools are not needed for this job, although the use of a torque wrench is strongly recommended for accurate measurement of bearing preload. The most important thing to remember when working with the wheel bearings is that although they are basically durable, in some ways they are remarkably fragile. Mishandling, grit, misalignment, scratches, improper preload, etc. will quickly destroy any roller bearing, no matter how well hardened during manufacture.

REMOVAL & INSTALLATION

Pick-Up and Pathfinder

1. Loosen the wheel nuts. Raise and safely support the vehicle. Remove the wheel/tire assembly.

2. Remove the brake caliper-to-steering knuckle bolts and suspend the caliper on a wire.

3. Using 2 small pry bars, pry the grease cap from the wheel hub. Remove the cotter pin (discard it), the adjusting cap nut, the adjusting nut, the thrust washer and the outside wheel bearing. Pull the hub/disc assembly from the wheel spindle.

NOTE: It is not necessary to remove the disc from the hub.

4. Using a hammer and a brass drift, drive the inside wheel bearing, the grease seal (discard it) and the inside outer race, then, invert the hub/disc assembly and remove the outside outer race.

5. Using solvent clean all of the parts, then, allow them to air dry or blow them dry with compressed air.

NOTE: Do not use a cloth to dry the parts, you risk leaving bits of lint in the races.

6. Inspect the wheel bearings for wear, cracks, pits, burns, scoring or etc., if necessary, replaced them; do not mix old and new parts.

7. Using multi-purpose grease, coat the wheel bearing parts thoroughly.

8. Using the wheel bearing race installation tool, drive the races into the wheel hub until they seat.

NOTE: Use care not to cock the bearing cups in the hub. If they are not fully seated, the bearings will be impossible to adjust properly.

9. Using the multi-purpose grease, pack the internal areas of the hub and cups.

10. To pack the wheel bearing with grease, perform the following procedures:

a. Place a large glob of grease into the palm of one hand.

b. Using a rolling motion and push the wheel bearing; continue packing until the grease begins to ooze through the roller gaps.

11. Install the inner bearing into its cup in the hub. Drive the new grease seal (bearing side is indicated) into the wheel hub until it is flush.

12. To complete the installation, use a new cotter pin and reverse the removal procedures. Adjust the wheel bearing.

Van

1. Loosen the wheel lug nuts. Raise and safely support the vehicle. Remove the wheel/tire assembly.

2. Remove the caliper-to-steering knuckle bolts and the caliper. Using a wire, suspend the caliper from the vehicle; do not disconnect the brake hose from the caliper.

3. Remove the grease cap from the wheel hub.

4. Remove the wheel bearing nut and the lockwasher. Pull the rotor/wheel hub from the spindle.

5. Remove the lock ring from the rotor/wheel hub.

6. Using a hydraulic press, press the wheel bearing and grease seal from the rotor/wheel hub assembly.

7. Using a new bearing, press it into the rotor/wheel hub assembly until it seats; use no more than 3 tons pressure. Install a new lock ring into the rotor/wheel hub.

8. To complete the installation, reverse the removal procedures. Torque the wheel bearing nut to 195–260 ft. lbs.

ADJUSTMENT

The Van does not require an adjustment procedure.

1. Raise and safely support the front of the vehicle. Remove the grease cup, the cotter pin and the adjusting nut retainer.

NOTE: If the wheel bearings have not been replaced, loosen the wheel bearing adjusting nut.

2. Using a torque wrench, torque the wheel bearing nut (while turning the wheel) to 22–29 ft. lbs.

3. Rotate the wheel hub a few more times to snug down the bearings.

4. Retighten the nut to 25–29 ft. lbs. Unscrew the adjusting nut $\frac{1}{8}$ turn (45°). Install the locknut (castellated nut) and snug it down against the adjusting nut until one of its grooves aligns with the a spindle hole.

NOTE: The adjusting nut can be tightened up to 15 degrees to allow the locknut holes to align.

5. Install a new cotter pin, bending its ends around the locknut.

6. Check the axial play of the wheel by shaking it back and forth. The bearing freeplay should feel close to zero but the wheel should spin freely.

REAR SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Remove the upper shock-to-vehicle nut, the lower shock-to-vehicle nut and the shock from the vehicle.

NOTE: The weight of the vehicle must be on the rear wheels before tightening the shock absorber attaching nuts.

3. To install, reverse the removal procedures. Torque as follows:

Upper shock-to-vehicle nut

Pick-Up and Pathfinder – 22–30 ft. lbs.

Van – 12–18 ft. lbs.

Lower shock absorber-to-axle nut

2WD – Pick-Up and 2WD Pathfinder – 12–16 ft. lbs.

– 4WD – Pick-Up and 4WD Pathfinder – 22–30 ft. lbs.

Van – 53–72 ft. lbs.

MacPherson Strut

REMOVAL & INSTALLATION

Axxess

2WD MODEL

On the 2WD models, the wheel spindle and knuckle are a part of the strut.

1. Remove the hub cap and cotter pin.

2. Apply the brakes and loosen the wheel bearing locknut.

3. Raise and safely support the vehicle. Remove the wheel assembly.

4. Remove the wheel bearing nut, washer and wheel hub bearing.

NOTE: The wheel hub bearing must be replaced as an assembly, if the bearing is defective.

5. Disconnect and plug the brake line from the wheel cylinder.

6. Remove radius rod-to-knuckle nut/bolt, the stabilizer rod-to-knuckle nut/bolt and the parallel rods-to-knuckle nut/bolt.

7. From inside the vehicle, remove the strut cover.

8. Remove the strut-to-chassis nuts and the strut.

To install:

9. Install strut and the strut-to-chassis nuts and torque to 43–58 ft. lbs. (59–78 Nm).

10. Install the parallel rods-to-knuckle nut/bolt and torque to 65–87 ft. lbs. (88–118 Nm).

11. Install the stabilizer rod-to-knuckle nut/bolt and torque to 43–58 ft. lbs. (59–78 Nm).

12. Install the radius rod-to-knuckle nut/bolt and torque to 65–87 ft. lbs. (88–118 Nm).

13. To install, reverse the removal procedures. Torque the wheel hub bearing assembly to 137–188 ft. lbs. (186–255 Nm).

14. Using a dial indicator, measure the bearing axial endplay; it should be 0.0020 in. (0.05mm) or less.

15. To complete the installation, reverse the removal procedures. Bleed the rear brakes and inspect the rear wheel alignment.

4WD MODELS

1. Raise and safely support the vehicle. Remove the wheel assembly.

2. Matchmark the strut-to-knuckle location.

3. Support the knuckle and remove the strut-to-knuckle nuts and bolts.

4. From inside the vehicle, remove the strut-to-chassis nuts.

5. Remove the strut from the vehicle.

6. To install, reverse the removal procedures. Torque the strut-to-chassis nuts to 43–51 ft. lbs. (59–69 Nm)

and the strut-to-knuckle nuts/bolts to 82–91 ft. lbs. (112–124 Nm).

7. To complete the installation, reverse the removal procedures.

8. Inspect the rear wheel alignment.

Coil Springs

REMOVAL & INSTALLATION

Van

1. Raise and safely support the vehicle.

2. Lower the axle housing and remove the coil spring(s).

3. To install, reverse the removal procedures.

Leaf Springs

REMOVAL & INSTALLATION

Pick-Up and Pathfinder

CAUTION

The leaf springs are under a considerable amount of tension. Be very careful when removing or installing them; they can exert enough force to cause serious injuries.

1. Raise and safely support the vehicle. Using a floor jack, support the axle housing.

2. Disconnect the shock absorbers at their lower end.

3. Remove the axle housing-to-spring pad U-bolt nuts and the spring pad.

4. Raise the axle housing to remove the weight off the springs.

5. Remove the spring shackle nuts, drive out the shackle pins and remove the spring from the vehicle.

NOTE: The weight of the vehicle must be on the rear wheels before torquing the front pin, shackle and shock absorber nuts.

6. To install, reverse the removal procedures. Torque as follows:

Front pin and shackle nuts—83–94 ft. lbs.

U-bolt nuts—53–72 ft. lbs.

Shock absorber lower end nut

2WD—12–16 ft. lbs.

4WD—22–30 ft. lbs.

Rear Control Arms

REMOVAL & INSTALLATION

Van

LOWER LINK

1. Raise and safely support the vehicle.

2. Remove the lower link-to-axle

housing nut/bolt and the lower link-to-chassis nut/bolt.

3. Remove the lower link from the vehicle.

4. To install, reverse the removal procedures. Torque the lower link-to-chassis nut/bolt to 80–94 ft. lbs. and the lower link-to-axle housing nut/bolt to 80–94 ft. lbs.

UPPER LINK

1. Raise and safely support the vehicle.

2. Remove the upper link-to-axle housing nut/bolt and the upper link-to-chassis nut/bolt.

3. Remove the upper link from the vehicle.

4. To install, reverse the removal procedures. Torque the upper link-to-chassis nut/bolt to 80–94 ft. lbs. and the upper link-to-axle housing nut/bolt to 80–94 ft. lbs.

PANHARD ROD

1. Raise and safely support the vehicle.

2. Remove the panhard rod-to-axle housing nut and the panhard rod-to-chassis nut/bolt.

3. Remove the panhard rod from the vehicle.

4. To install, reverse the removal procedures. Torque the panhard rod-to-chassis nut/bolt to 80–94 ft. lbs. and the panhard rod-to-axle housing nut to 36–50 ft. lbs.

Axxess

2WD MODELS WITH RADIUS ROD

1. Raise and safely support the vehicle.

2. Remove the wheel assembly.

3. Remove the radius rod-to-knuckle nut and bolt.

4. Remove the radius rod-to-chassis nut/bolt and the rod.

5. To install, reverse the removal procedures. Torque the radius rod-to-chassis nut/bolt to 65–80 ft. lbs. (88–108 Nm) and the radius rod-to-knuckle nut/bolt to 65–80 ft. lbs. (88–108 Nm).

6. To complete the installation, reverse the removal procedures.

2WD MODELS WITH PARALLEL RODS

Dual rods are connected from the chassis to the knuckle.

1. Raise and safely support the vehicle.

2. Remove the wheel assembly.

3. Remove the parallel rods-to-knuckle nut and bolt.

4. Remove the parallel rods-to-chassis nut/bolt and the rods.

5. To install, reverse the removal procedures. Torque the parallel rods-to-chassis nut/bolt to 65–87 ft. lbs.

(88–118 Nm) and the parallel rods-to-knuckle nut/bolt to 65–87 ft. lbs. (88–118 Nm).

6. To complete the installation, reverse the removal procedures.

4WD MODELS WITH RADIUS ROD

1. Raise and safely support the vehicle.

2. Remove the wheel assembly.

3. Remove the radius rod-to-knuckle nut and bolt.

4. Remove the radius rod-to-chassis nut/bolt and the rod.

5. To install, reverse the removal procedures. Torque the radius rod-to-chassis nut/bolt to 65–80 ft. lbs. (88–108 Nm) and the radius rod-to-knuckle nut/bolt to 58–72 ft. lbs. (78–98 Nm).

6. To complete the installation, reverse the removal procedures.

4WD WITH PARALLEL RODS

Dual rods are connected from the chassis to the knuckle.

1. Raise and safely support the vehicle.

2. Remove the wheel assembly.

3. Remove the parallel rods-to-knuckle nut and bolt.

4. Remove the parallel rods-to-chassis nut/bolt and the rods.

5. To install, reverse the removal procedures. Torque the parallel rods-to-chassis nut/bolt to 58–72 ft. lbs. (78–98 Nm) and the parallel rods-to-knuckle nut/bolt to 58–72 ft. lbs. (78–98 Nm).

6. To complete the installation, reverse the removal procedures.

Rear Wheel Bearings

For RWD models, refer to the drive axle section.

REMOVAL & INSTALLATION

Axxess

1. Remove the hub cap, the grease cap and the cotter pin.

2. Loosen the wheel hub nut; do not remove it.

3. Raise and safely support the vehicle.

4. Remove the wheel assembly and the brake drum.

5. Remove the hub nut, the washer and the wheel hub assembly.

NOTE: If the wheel bearings are defective, replace the entire wheel hub bearing assembly.

6. To install, reverse the removal procedures. Torque the wheel hub nut to 137–188 ft. lbs. (186–255 Nm).

ENGINE ELECTRICAL

NOTE: Disconnecting the battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is disconnected.

Distributor

REMOVAL & INSTALLATION

1. Disconnect the negative battery terminal from the battery.

2. Disconnect vacuum hose and electrical connections.

NOTE: Do not bend or twist the spark plug wires to avoid internal damage. Grip the the wire boot when removing or installing the wires.

3. Remove the distributor cap.

4. Mark the rotor position on the distributor housing and the distributor housing position on the engine.

5. Remove the distributor flange bolt and remove the distributor.

NOTE: Do not crank the engine with the distributor removed.

6. If the engine has not been disturbed with the distributor removed, reverse the removal procedure to install.

7. Set the timing to specification.

8. If the engine was accidentally cranked after the distributor was removed (or if the matchmark was not made prior to the removal of the distributor), the following procedure can be used to properly the position the distributor:

a. Rotate the crankshaft in the clockwise position until the specified timing mark on the flywheel aligns with the timing matchmark on the engine.

NOTE: After aligning the 2 marks, remove the cylinder head cover to visually confirm that the rocker arms are not riding on the camshaft cams at No. 1 cylinder. If the arms are found to be riding on the cams, turn the crankshaft

360 degrees to realign the 2 marks.

- Position the rotor to the No. 1 cylinder position and install the distributor.
- Re-attach the vacuum and electrical connections.
- Adjust the ignition timing.

Ignition Timing

ADJUSTMENT

- Start the engine and warm up to normal operating temperature. Prior to any adjustment, be sure all the electrical accessories are **OFF**.
- After warming up, make sure the idle speed is within the proper specification.
- Connect the timing light to the No. 1 cylinder spark plug wire.
- With the engine running at the specified idle speed, direct the timing light to the crankshaft pulley. If the specified timing mark on the timing tab is aligned with the timing notch on the crankshaft pulley the ignition is properly timed.
- If the timing is out of adjustment, loosen the distributor flange bolt and turn the distributor housing to advance or retard the timing. Turn the distributor counterclockwise to advance the timing and clockwise to retard the timing.
- After the adjustment, tighten the flange bolt and recheck the timing.

Alternator

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

BELT TENSION ADJUSTMENT

- Disconnect the negative battery cable.
- Loosen the alternator bolt and pivot bolts.
- Adjust the belt tension to 0.24 - 0.32 in. of deflection using a belt tension gauge.

REMOVAL & INSTALLATION

- Disconnect the negative battery cable.
- Disconnect the wire coupler and white lead wire from the alternator.
- Remove the charcoal cannister mounting bracket, if necessary.
- Remove the alternator mounting

Timing mark alignment — Samurai
The timing marks are visible by removing the rubber plug in the bell housing

Timing belt marks — Sidekick and Tracker

bolt and alternator drive belt adjusting bolt.

- Remove the alternator from the vehicle.
- Installation is the reverse of the removal procedure. Adjust the drive belt tension.

Starter

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

REMOVAL & INSTALLATION

- Disconnect the negative battery cable.
- Raise and support the vehicle safely.
- Disconnect the lead wire and battery cable from the starter motor.
- Support the starter and remove the 2 mounting bolts.
- Remove the starter.
- Installation is the reverse of the removal procedure.

CHASSIS ELECTRICAL

Heater Blower Motor

REMOVAL & INSTALLATION

Samurai

- Disconnect the negative battery cable. Drain the cooling system.
- Disconnect the inlet and outlet heater hoses from the heater core.
- Take off the horn pad and remove the steering wheel retaining nut and remove the steering wheel by using the proper puller.
- Disconnect and tag the radio and cigar lighter wires. Remove the radio from the vehicle.

NOTE: When removing the heater lever case which is fitted in the steering column holder, be very careful not to damage it.

- Loosen the front door opening stop screws and remove the steering column holder.
- Disconnect and tag the blower motor and resistor connections at the coupler.
- Loosen the heater case securing nut on the engine side.
- Remove the heater assembly from the vehicle.
- Remove the blower motor from the case.
- To install:**
- Install the blower motor in the heater case and replace the heater assembly in the vehicle.
- Tighten the heater case securing nut on the engine side.
- Install the blower motor and resistor connections at the coupler.
- Tighten the front door opening stop screws and replace the steering column holder.
- Tighten the instrument panel mounting screws and replace the instrument panel.

23. Reconnect the wiring harness clamps to the instrument panel.
24. Reconnect the lead wires and speedometer cable to the speedometer.
25. Install the defroster and side ventilator hoses.
26. Replace the heater control knobs and plate, and tighten the lever case screws.
27. Reconnect the heater control cables at the controls.
28. Reconnect the hood release cable to the release lever.
29. Replace the ash tray and mounting plate.
30. Reconnect the radio and cigar lighter wires. Install the radio in the vehicle.
31. Install the horn pad and replace the steering wheel retaining nut and install the steering wheel.
32. Reconnect the inlet and outlet heater hoses to heater core.
33. Refill the cooling system with the proper coolant. Replace the negative battery cable.

Sidekick and Tracker

1. Disconnect the negative battery cable.
2. Remove the glove box assembly.
3. Disconnect the blower motor and resistor wire connectors.
4. Disconnect the fresh air control cable from the blower motor case.
5. Loosen, but do not remove the blower housing fastener bolts.
6. Remove the 3 blower motor mounting screws.
7. Remove the blower motor.
8. Installation is the reverse of the removal procedure.

Windshield Wiper Motor

REMOVAL & INSTALLATION

Samurai Soft Top

1. Disconnect the negative battery cable.
2. Remove the wiper linkage to wiper mounting nut.
3. Disconnect the wire connector from the wiper motor.
4. Remove the 3 wiper mounting bolts and remove the wiper motor.
5. Installation is the reverse of the removal procedure.

Samurai Hard Top

NOTE: On hard top models, the windshield frame may have to be removed.

1. Disconnect the negative battery cable.
2. Loosen the weatherstrip bonded

to the window body panel and remove the windshield from the vehicle.

3. Remove the wiper linkage to wiper mounting nut.
4. Disconnect the wire connector from the wiper motor.
5. Remove the 3 wiper mounting bolts and remove the wiper motor.
6. Installation is the reverse of the removal procedure.
7. Remove the urethane gum sticking to the glass and the window panel.
8. Use a proper cleaning solvent to clean the glass, the weatherstrip and the window body panel.

9. Assemble the glass into the weatherstrip's glass channel. Do not use soapy water as a lubricant, use a proper cleaning agent as a lubricant.

10. Insert a cord into the weatherstrip's body flange channel and install the glass and weatherstrip assembly to the window body panel.

11. Start the installation from the bottom center of the glass.

12. Position the glass and weatherstrip assembly in the window panel body opening, with a helper applying pressure from the outside.

13. Pull the weatherstrip over the flange with the cord to install the assembly into position.

14. Tap the glass from the outside to settle into position.

15. Use a proper urethane based bonding agent and fill between the glass and the weatherstrip and also between the window body panel and the weatherstrip.

16. Clean any excess bonding agent with a proper cleaning solvent.

Sidekick and Tracker

1. Disconnect the negative battery cable.
2. Remove the right and left cowl grilles.
3. Remove the wiper linkage to wiper mounting nut.
4. Disconnect the wire connector from the wiper motor.
5. Remove the 4 wiper mounting bolts and remove the wiper motor.
6. Installation is the reverse of the removal procedure.

Instrument Cluster

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the lower instrument panel cover.
3. Loosen, but do not remove the 2 upper and 4 lower steering column mounting bolts. Lower and support the steering column, if necessary.
4. Remove the outer instrument cluster cover.

5. Remove the 4 cluster mounting screws, and slide the cluster outwards.
6. Disconnect the lead wires and speedometer cable from the speedometer.
7. Remove the speedometer.
8. Disconnect and tag the wire connector from the rear of the instrument cluster.
9. Remove the instrument cluster.
10. Installation is the reverse of the removal procedure.

Radio

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Loosen the retaining bracket at the rear of the rear of the radio.
3. Remove the pins from the 4 corners of the radio front.
4. Disconnect the electrical connections and antenna lead from the radio.
5. Remove the radio from the vehicle.
6. Installation is the reverse of the removal procedure.

Combination Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Take off the horn button and remove the steering wheel retaining nut and remove the steering wheel.
3. Remove the upper and lower column cover screws and remove the covers.
4. Disconnect the lead wires from the combination switch at the connector.
5. Remove the combination switch assembly screws.
6. Remove the combination switch from the steering column.
7. Installation is the reverse of the removal procedure.

Ignition Switch

1. Disconnect the negative battery cable.
2. Remove the steering wheel from the vehicle.
3. Disconnect the wire connector at the ignition switch.
4. With the ignition switch in the **OFF** position, remove the mounting bolts and remove the switch.
5. Installation is the reverse of the removal procedure.

Ignition Lock

1. Disconnect the negative battery cable.

2. Remove the steering wheel.
3. Disconnect the lead wires to the ignition and combination switches.
4. Disconnect the steering joint by removing the joint bolt.
5. Remove the steering column fastening bolts.
6. Remove the steering column assembly.
7. Using a center punch, loosen and remove the steering lock mounting bolts.
8. Turn the key to **ACC** or **ON** position and remove the steering lock assembly from the steering column.
9. To install the switch position the oblong hole of the steering shaft in the center of the hole in the steering column.
10. Turn the ignition key to the **ACC** or **ON** position and install the steering lock assembly onto the column.
11. Turn the ignition key to the **LOCK** position and remove it.
12. Align the hub on the lock with oblong hole of the steering shaft.
13. Rotate the shaft to assure that the steering shaft is locked.
14. Tighten the 2 new steering lock mounting bolts.
15. Turn the ignition key to the **ACC** or **ON** position and check to be sure that the steering shaft rotates smoothly. Also check the lock mechanism.
16. Install the steering column assembly by attaching the steering joint and joint bolt.
17. Install the steering column fastening bolts.
18. Reconnect the lead wires to the ignition and combination switches.
19. Replace the steering wheel and negative battery cable.

Stoplight Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the under dash trim panel, if equipped.
2. Push the brake pedal down and remove the stoplight locknut.
3. Disconnect the wire connector at the switch.
4. Remove the switch from the bracket.
5. Install the new switch on the bracket.
6. Adjust the switch so that there is 0.02–0.04 in. clearance between the switch and the brake pedal.
7. Replace the locknut and tighten to 7.5–10.5 ft. lbs.
8. Replace the negative battery cable.

Clutch Switch

REMOVAL & INSTALLATION

Sidekick and Tracker

1. Disconnect the negative battery cable. Remove the under dash trim panel, if equipped.
2. Disconnect the start switch connector beside the clutch pedal bracket.
3. Remove the locknut and start switch.

Fuses and Circuit Breakers

LOCATION

The fuse box is located under the drivers side of the dashboard.

ENGINE COOLING

Radiator

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Drain the cooling system.
3. Disconnect and plug the transmission cooler lines, if equipped.
4. Loosen the water pump drive belt tension.
5. Remove cooling fan and radiator shroud.
6. Disconnect the water hoses to the radiator.
7. Remove the radiator retaining bolts and remove the radiator.
8. Replace the radiator mounting bolts and install the radiator.
9. Reconnect the water hoses to the radiator.
10. Install the cooling fan and radiator shroud.
11. Tighten the water pump drive belt to the proper tension.
12. Reconnect the transmission cooler lines, if necessary to the radiator.
13. Refill the cooling system.
14. Reconnect the negative battery cable.

Heater Core

REMOVAL & INSTALLATION

Samurai

1. Disconnect the negative battery cable. Drain the cooling system.

2. Disconnect the heater hoses from the heater core.
3. Disconnect the radio and cigar lighter lead wires, and remove the radio from the vehicle.
4. Remove the ash tray and mounting plate.
5. Disconnect the hood release cable from the release lever.
6. Disconnect and tag the heater control cables and wires at the controls.
7. Remove the heater control lever knobs and facing plate, and loosen the lever case screws.
8. Remove the defroster and side ventilator hoses.
9. Disconnect the lead wires and speedometer cables from the speedometer.
10. Disconnect the wiring harness from the instrument panel.
11. Loosen the instrument panel mounting screws and remove the instrument panel.
12. Loosen the front door opening stop screws and remove the steering column holder.
13. Disconnect and tag the blower motor and resistor connections at the coupler.
14. Loosen the heater securing nut on the engine side.
15. Remove the heater assembly from the vehicle.
16. Remove the clips holding the heater case together, separate the case and remove the heater core.

To install:

17. Install the heater core into the heater case and replace the clips holding the case together.
18. Install the heater assembly in the vehicle and tighten the securing nut on the engine side.
19. Reconnect the blower motor and resistor connections at the coupler.
20. Replace the steering column holder and tighten the front door opening stop screws.
21. Install the instrument panel and tighten panel mounting screws.
22. Reconnect the wiring harness to the instrument panel.
23. Install the defroster and side ventilator hoses.
24. Tighten the heater control case screws and replace the control knobs and facing plate.
25. Reconnect the heater control cable and wires to the heater control.
26. Reconnect the hood release cable the release lever.
27. Replace the ash tray and mounting plate.
28. Install radio and connect the cigar lighter and radio wires.
29. Reconnect the heater hoses to the heater core

30. Refill the cooling system to the proper with the proper coolant. Replace the negative cable.

Sidekick and Tracker

1. Disconnect the negative battery cable. Drain the cooling system.

2. Disconnect the heater hose from the heater core.

3. Remove the steering wheel. Disconnect the lead wires from the ignition and combination switches.

4. Disconnect the steering joint, by removing the joint bolt.

5. Remove the steering column fastener bolts and remove the steering column assembly.

6. Disconnect the 2 front screws from the center console.

7. Disconnect the 2 back lock pins from the console.

8. Ease in the shifter boot and lift out the housing and console.

9. Remove the steering wheel housing and instrument cluster.

10. Remove the 3 inspection cover and upper housing cover bolts.

11. Remove the 3 lower housing bolts on the driver's side and remove the center cover dash mount.

12. Remove the glove box and the lower dash screws to remove the handle bar on the passenger's side.

13. Move the hood release bolt lever and remove the center mounting bracket from the radio and ash tray.

14. Disconnect the wiring harness and remove the instrument panel.

15. Disconnect all the wiring connections and cables from the heater controls.

16. Disconnect the defroster duct and speedometer cable retaining bracket from the heater case.

17. Remove the heater assembly and remove the heater core.

To install:

18. Install the heater core and replace the heater assembly.

19. Reconnect the defroster duct and speedometer cable retaining bracket to the heater case.

20. Reconnect the wiring connections and cables to the heater controls.

21. Reconnect the wiring harness and install the instrument panel.

22. Replace the center mounting bracket from the radio and ash tray and realign hood release bolt lever.

23. Replace the handle bar on the passenger's side and install the glove box and lower dash screws.

24. Install the center cover dash mount and replace the 3 lower housing bolts on the driver's side.

25. Install the upper housing and inspection cover bolts.

26. Install the instrument cluster and steering wheel housing.

27. Install center housing and con-

sole and connect the 2 back lock pins to the console.

28. Connect the 2 front screws to center console.

29. Install the steering column assembly and replace the steering column fastener bolts.

30. Install the joint bolt and connect the steering joint to the steering column assembly.

31. Connect the lead wires to the ignition and combination switches and install the steering wheel.

32. Connect the heater hoses to the heater core.

33. Refill the cooling system with the proper coolant and replace the negative battery cable.

Water Pump

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Loosen the drive belt tension and remove the drive belt. If equipped, loosen the air conditioning belt tension and remove the air conditioning belt.

4. Remove the radiator fan shroud mounting bolts and radiator fan mounting bolts. Remove the radiator shroud, fan and water pump pulley from the vehicle.

5. Remove the crankshaft pulley bolts and remove the crankshaft pulley.

NOTE: The crankshaft pulley bolt can be removed without removing the center crankshaft bolt.

6. Remove the timing belt cover mounting bolts and remove the cover.

7. Loosen the timing belt tensioner adjusting bolt and pivot nut. Hold the tensioner to loosen the timing belt and remove the belt from the camshaft pulley.

8. Remove the timing belt tensioner mounting bolts and remove the tensioner plate and spring.

9. Remove the water pump mounting bolts and remove the water pump assembly.

10. On Tracker, it is necessary to remove the dip stick tube and the alternator bracket from the vehicle.

To install:

11. Clean and inspect the surface of the engine before installation.

12. Using a new gasket, install the new water pump on the engine. Torque the mounting bolts to 7.5–9.0 ft. lbs.

13. On Tracker, replace the dip stick tube and the alternator bracket to the vehicle.

14. Install the rubber seals between the water pump to cylinder head and water pump to oil pump.

15. Install the timing belt tensioner plate, tensioner and spring.

16. Align the marks on the timing belt and the camshaft sprocket. Install the timing belt in the same position on the camshaft sprocket as when removed.

17. Adjust the timing belt to be free of any slack. Torque the tensioner bolts to 7.5–9.0 ft. lbs.

18. Install the crankshaft and water pump pulleys. Torque the crankshaft and water pulley bolts to 7.5–9.0 ft. lbs.

19. Install the timing belt cover, cooling fan/clutch, shroud and drive belt. Adjust the belt tension.

20. As required, adjust the intake and exhaust valve lash.

21. Refill the cooling system with the proper coolant and replace the negative battery cable.

Thermostat

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Disconnect the thermostat cap from the intake manifold and remove the thermostat.

4. Clean and inspect the surfaces of the housing and the engine.

5. Install the new thermostat with the spring facing towards the engine.

6. Install a new gasket and the thermostat cap to the intake manifold.

7. Refill the cooling system with the proper coolant and replace the negative battery cable.

COOLING SYSTEM BLEEDING

In the top portion of the thermostat, an air bleed valve is provided. This valve is for venting air, if any, that is accumulated in the system.

FUEL SYSTEM

Fuel System Service Precaution

When working with the fuel system, certain precautions should be taken; always work in a well ventilated area, keep a dry chemical (Class B) fire extinguisher near the work area. Always

disconnect the negative battery cable and do not make any repairs to the fuel system until all the necessary steps for repair have been reviewed.

RELIEVING FUEL SYSTEM PRESSURE

The fuel pressure must be relieved before performing any service on the fuel system.

1. Disconnect the negative battery cable.
2. Remove the fuel filler cap from the fuel filler neck to release the fuel vapor pressure in the fuel tank. Reinstall the fuel cap.
3. Raise and support the vehicle safely.
4. Place an appropriate container under the fuel filter.
5. Cover the plug bolt on the fuel filter inlet union bolt with a rag and loosen the plug bolt slowly to release the fuel pressure gradually.
6. When the pressure has been released, tighten the plug bolt to 7.5 ft. lbs. so that the fuel does not leak.
7. Lower the vehicle.
8. Reconnect the negative battery cable.

Fuel Filter

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the fuel filler cap to release the fuel vapor pressure in the fuel tank. After releasing pressure, reinstall filler cap.
3. Raise and support the vehicle safely.
4. Release the fuel pressure.
5. Disconnect the inlet and outlet hoses from the fuel filter.
6. Remove the fuel filter from the chassis frame.
7. Installation is the reverse of the removal procedure.

Mechanical Fuel Pump

REMOVAL & INSTALLATION

1.3L Engine

1. Disconnect the negative battery cable.
2. Remove the fuel filler cap to release the fuel vapor pressure in the fuel tank.
3. Disconnect and tag the fuel inlet, outlet and return hoses from the fuel pump.
4. Remove the fuel pump mounting bolts and remove the fuel pump.
5. Remove the fuel pump mounting

rod from the engine and lubricate it with engine oil before installation.

6. Install the lubricated pump rod in the engine.
7. Clean the engine mounting surface and install the fuel pump using a new gasket.
8. Connect the inlet, outlet and return hoses to the fuel pump.
9. Reconnect the negative battery cable. Run the engine and check for leaks when finished.

Electric Fuel Pump

PRESSURE TESTING

1. Remove the fuel filler cap to release the fuel vapor pressure in the fuel tank. Reinstall the cap.
2. Raise and support the vehicle safely.
3. Release the fuel pressure in the fuel feed line.
4. Remove the plug bolt on the fuel filter union bolt and connect the proper fuel pressure gauge to the fuel filter inlet union bolt.

NOTE: If the pressure in the fuel tank is not released prior to system service, the fuel in the fuel tank may be forced out through the fuel hoses during disconnection.

5. Start the engine and warm up to the proper operating temperature.
6. Measure the fuel pressure under each of the following conditions.
 - a. At a specified idle speed or with the fuel pump operating and the engine stopped the fuel pressure should read: 34.1–39.8 psi.
 - b. Within 1 minute after the fuel pump has stopped the fuel pressure should read: 21.3 psi.
7. Release the fuel pressure and remove the fuel pressure gauge.
8. Install the plug bolt to the fuel filter inlet bolt. Use a new gasket.
9. Start the engine and check for leaks.
10. Lower the vehicle.

REMOVAL & INSTALLATION

1.6L Engine

The fuel pump is located in the fuel tank. The fuel pump and the fuel gauge sending unit are located on the upper part of the fuel tank.

1. Disconnect the negative battery cable.
2. Remove the rear bumper assembly.
3. Disconnect the fuel gauge sending unit and fuel pump electrical connectors from the fuel tank.
4. Relieve the fuel system pressure.

Checking fuel pump pressure – 1.6L engine

5. Disconnect the fuel tank filler hose cover, filler hose, and fuel tank inlet valve (breather hose).
6. Disconnect the inlet pipe from the fuel filter and remove the fuel vapor and return hoses.
7. If necessary, drain the fuel from the tank using a hand operating pump.
8. Disconnect the fuel tank protector and remove the fuel tank and cover from the vehicle.
9. Remove the fuel pump from the fuel tank.
10. Install the fuel pump to the fuel tank using a new gasket.
11. Install the fuel tank and cover to the vehicle and connect the fuel tank protector.
12. Replace the fuel vapor and return hoses and connect the inlet pipe to the fuel filter.
13. Reconnect the fuel tank inlet valve (breather hose), filler hose, and fuel tank filler hose cover.
14. Connect the fuel pump and fuel gauge sending unit electrical connectors to the fuel tank.
15. Replace the bumper assembly and reconnect the negative battery cable.
16. If necessary, refill the fuel tank with any fuel that had been drained.
17. Start the engine and check for leaks when finished.

Carburetor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Drain the cooling system.
2. Remove the air intake case from the carburetor.
3. Disconnect and tag the micro switches, switch vent solenoid valve, fuel cut off valve, vacuum switch valve and mixture control valve (MCSV) lead wires at their couplers.
4. Disconnect the EGR valve bracket from the carburetor.
5. Disconnect the water inlet and outlet hoses from the carburetor.
6. Disconnect the accelerator cable from the carburetor.

7. Relieve the fuel pressure by removing the fuel filler cap and reinstalling it. Remove the fuel inlet hose from the carburetor.

8. Remove the carburetor mounting nuts and remove the carburetor from the intake manifold.

9. Install the carburetor to the intake manifold and replace the mounting nuts. Torque the carburetor mounting nuts to 20 ft. lbs.

10. Install the fuel inlet hose and connect the accelerator cable to the carburetor.

11. Reconnect the water inlet and outlet hoses to the carburetor.

12. Connect the EGR valve bracket to the carburetor.

13. Reconnect the micro switches, switch vent solenoid valve, fuel cut off valve, vacuum switch valve and (MCSV) lead wires to their couplers.

14. Replace the air intake hose to the carburetor.

15. Refill the cooling system with the proper coolant and connect the negative battery cable.

IDLE SPEED ADJUSTMENT

NOTE: Before starting the engine, place the gear shift lever in neutral for manual transmission and P for automatic transmission. Set the parking brake and block the drive wheels.

Idle adjustment—1.3L engine

Idle mixture adjustment—1.3L engine

1. Warm up the engine to the normal operating temperature.

2. Check the idle speed to see if within specifications; 750–850 rpm.

3. If idle speed is not within specifications, adjust by turning the idle speed adjusting screw.

4. After idle speed adjustment, check idle-up for operation with the electrical accessories **ON** one at a time.

IDLE MIXTURE ADJUSTMENT

1. Remove the carburetor from the intake manifold to gain access to the mixture adjusting screw pin covering the mixture adjusting screw.

2. Drive out the mixture adjusting screw pin using about 0.18 in. thick iron rod.

3. Reinstall the carburetor.

4. Before starting the engine, place the gear shift lever in neutral for manual transmission and P for automatic transmission. Set the parking brake and block the drive wheels.

5. Start the engine and warm up to normal operating temperature.

6. Check and adjust the idle speed if necessary.

7. Remove the rubber seal of the dwell check coupler and connect the positive terminal of a dwell meter to the blue and red wire and negative terminal to the black and green wire.

8. Run the engine at 1500–2000 rpm for 30 seconds and adjust the idle speed.

9. Adjust the idle mixture adjusting screw slowly, allowing for the dwell to stabilize after turning screw to obtain a dwell of 10–50 @ 750–850 rpm.

10. Recheck the engine idle speed.

11. Install the rubber seal to the dwell check coupler and drive in idle mixture adjusting pin.

SERVICE ADJUSTMENT

For all carburetor service adjustment procedures and Specifications, please refer to "Carburetor Service" in the Unit Repair section.

Fuel Injection

IDLE SPEED ADJUSTMENT

NOTE: Before starting the engine, place the gear shift lever in neutral for manual transmission and P for automatic transmission. Set the parking brake and block the drive wheels.

1. Warm up the engine to the normal operating temperature.

IDLE ADJUSTING SCREW

Idle adjustment—1.6L engine

2. Race the engine until the engine speed exceeds 1500 rpm and then let it slow down to idle speed.

3. Check and see if the idle speed is within 750–850 rpm.

Fuel Injector

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Release the fuel pressure in the fuel feed line.

3. Remove the the air intake case from the throttle body.

4. Remove the fuel feed pipe clamp from the intake manifold and disconnect the fuel feed pipe from the throttle body.

5. Remove the injector cover.

6. Disconnect the injector coupler, release its wire harness from the clamp and remove its grommet from the throttle body.

7. Place a cloth over the injector and a hand on top of it. Using an air gun, blow low pressure compressed air into the fuel inlet port of the throttle body, and the injector can be removed.

NOTE: Be precise about the pressure of the compressed air. Using excessively high pressure may force the injector to jump out and may cause damage, not only to the injector itself but also to other parts.

EMISSION CONTROLS

Please refer to "Emission Control" in the Unit Repair section for system maintenance procedures. Due to the complex nature of modern electronic engine control systems, comprehensive diagnosis and testing procedures fall outside the confines of this repair manual. For complete information on diagnosis, testing and re-

pair procedures concerning all modern engine and emission control systems, please refer to "Chilton's Guide to Electronic Engine Controls".

Emission Warning Lamps

The CHECK ENGINE light automatically comes on at 50,000, 80,000, and 100,000 miles.

RESETTING

The lamp reset switch is located on the left side of the dashboard, mounted on the steering column support. The lamp can be reset by moving the switch upwards and then downwards. If the switch remains on after being reset, check the system.

ENGINE MECHANICAL

NOTE: Disconnecting the battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is disconnected.

Engine

REMOVAL & INSTALLATION

1. Disconnect the negative and positive cables at the battery.
2. Remove the hood from the vehicle and drain the cooling system.
3. Remove the radiator reservoir tank, fan shroud, cooling fan and radiator.

Resetting the check engine light

4. Properly discharge the air conditioning system and remove the air conditioning condenser, if equipped.

5. Remove the air cleaner outlet hose.

6. Disconnect the accelerator and the automatic transmission kickdown cable from the throttle body, if equipped.

7. Disconnect and tag the throttle opener VSV and EGR VSV wires at the coupler.

8. Disconnect and tag the water temperature, oil pressure, air temperature and ground cable wires at the intake manifold.

9. Disconnect and tag the injector, throttle position sensor and idle speed control solenoid valve wires at their couplers, if equipped.

10. Disconnect the PTC heater wires at the coupler for automatic transmission vehicles, if equipped.

11. Disconnect and tag the wires at the starter and alternator.

12. Disconnect and tag the oxygen sensor and distributor wires at their couplers. Remove the coil wire.

13. Remove the starter motor and disconnect the ground wires from the distributor assembly.

14. Remove the fuel tank filler cap to relieve the pressure. Reinstall the cap.

15. Relieve the fuel pressure in the fuel feed line. Disconnect and tag the fuel feed and return hoses.

16. Remove the gear shift lever mounting bolts and remove the shifter.

17. Disconnect the canister purge hose and remove the pressure sensor hose from the fuel filter, if equipped.

18. Disconnect the brake booster hose from the intake manifold.

19. Remove the vacuum hose for the automatic transmission from the intake manifold, if equipped.

20. Disconnect the heater hoses from the heater core outlet pipe and the intake manifold.

21. Raise and safely support the vehicle.

22. Drain the engine oil and remove the exhaust pipe from the exhaust manifold and muffler.

23. Disconnect the clutch cable if equipped with manual transmission.

24. Drain the automatic transmission fluid, if equipped.

25. Disconnect the clutch (torque converter) housing lower plate.

26. Remove the lock drive plate, using the special tool, if equipped with automatic transmission.

27. Lower the vehicle.

28. Remove the nuts and bolts fastening the cylinder block and transmission.

29. Support the transmission, using an appropriate stand or jack.

30. Support the engine from the top using a chain type hoist or equivalent means.

31. Remove the engine mounts with the chassis side mounting brackets.

NOTE: Before lifting the engine, check to ensure all the hoses, wires and cables are disconnected from the engine.

32. Remove the engine assembly from the chassis and transmission by sliding towards the front side and carefully hoist the engine.

To install

33. Install the engine into the engine compartment and connect to the transmission.

34. Replace the engine mounts with the chassis side mounting brackets. Tighten to 41 ft. lbs.

35. Remove the lifting device.

36. Install the nuts and bolts fastening the cylinder block and transmission.

37. Raise and safely support the vehicle.

38. Replace the lock drive plate, if equipped.

39. Connect the clutch (torque converter) housing lower plate.

40. Connect the automatic transmission lines, if equipped.

41. Reconnect the clutch cable to the bracket, if equipped with manual transmission.

42. Replace the exhaust pipe to the exhaust manifold and muffler.

43. Lower the vehicle.

44. Reconnect the heater hoses to the heater core outlet pipe and the intake manifold.

45. Install the vacuum hose for the automatic transmission to the intake manifold, if equipped.

46. Reconnect the brake booster hose to the intake manifold.

47. Replace the pressure sensor hose to the fuel filter and connect the canister purge hose, if equipped.

48. Replace the fuel return and feed hoses.

49. Install the starter motor and connect the ground wire to the distributor.

50. Replace the coil wire and connect the oxygen sensor and distributor wires to their couplers.

51. Reconnect the wires at the alternator and starter motor.

52. Replace the PTC heater wires at the coupler, if equipped with automatic transmission.

53. Install the idle speed control solenoid valve, throttle position sensor and injector wires at their couplers, if equipped.

54. Connect the ground cable, air temperature, oil pressure and water

temperature wires to the intake manifold.

55. Reconnect the throttle opener VSR and EGR VSR wires to their couplers, if equipped.

56. Connect the accelerator cable and the automatic transmission kickdown cable, if equipped, to the throttle body.

57. Replace the air cleaner outlet hose. Refill the engine oil and the transmission oil to the proper level.

58. Replace the air conditioning condenser and properly recharge the air conditioning system, if equipped.

59. Replace the radiator, cooling fan, fan shroud and radiator reservoir tank.

60. Replace the hood and refill the cooling system with the proper coolant.

61. Reconnect the positive and negative battery cables.

62. Adjust the accelerator, clutch and the automatic transmission kickdown cable, if equipped.

63. Before starting the engine, check to see if all the parts disassembled are back in place securely.

64. Start the engine and check the timing. Check for any oil leaks.

Cylinder Head

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Drain the cooling system.

2. Disconnect the air intake case.

3. Disconnect the brake booster hose from the intake manifold and the air valve water hose from the throttle body.

4. Disconnect the accelerator and the automatic transmission kickdown cable, if equipped, from the throttle body.

5. Disconnect and tag the throttle opener VSV and EGR VSV wires at the coupler.

6. Disconnect and tag the water temperature, oil pressure, air temperature sensor and ground cable wires at the intake manifold.

7. Disconnect and tag the injector, throttle position sensor and idle speed control solenoid valve wires at their couplers, if equipped.

8. Disconnect the PTC heater wires at the coupler, if equipped with automatic transmission.

9. Disconnect and tag the oxygen sensor and distributor wires at their couplers. Remove the coil wire.

10. Disconnect the ground wires from the distributor assembly.

11. Remove the fuel tank filler cap to relieve the pressure. Reinstall the cap.

12. Release the fuel pressure in the fuel feed line.

Cylinder head and bolt tightening sequence

13. Disconnect the fuel feed and return hoses.

14. Disconnect the canister purge hose and remove the pressure sensor hose from the fuel filter, if equipped.

15. Remove the vacuum hose for the automatic transmission from the intake manifold, if equipped.

16. Disconnect the radiator cooling fan, fan shroud, water pump drive belt and water pump pulley.

17. Disconnect the crankshaft pulley, timing belt cover and the timing belt.

18. Raise and safely support the vehicle.

19. Disconnect the exhaust pipe from the exhaust manifold and lower the vehicle.

20. Disconnect the air conditioning compressor adjusting arm, if equipped.

21. Remove the cylinder head cover mounting bolts and remove the cylinder head cover.

22. Loosen all the valve adjusting screw locknuts, turn the adjusting screws back all the way to allow all the valves to close.

23. Remove the intake manifold with the carburetor attached, from the cylinder head.

24. Remove the distributor and distributor housing from the cylinder head.

25. Remove the cylinder head mounting bolts and remove the cylinder head from the engine.

26. Remove any oil and water in the cylinder bores and on top of the pistons.

27. Clean and inspect the sealing surfaces of the cylinder head and the engine block.

To install

28. Install the cylinder head using a new gasket.

29. Replace the cylinder head mounting bolts and tighten to 46-54 ft. lbs.

30. Install the distributor and distributor housing to the cylinder head.

31. Replace the intake manifold with the carburetor attached, to the cylinder head.

32. Tighten all the valve adjusting screw nuts.

33. Adjust the valve lash.

34. Replace the cylinder head cover and connect the air conditioning compressor adjusting arm, if equipped.

35. Raise and safely support the vehicle.

36. Connect the exhaust pipe to the exhaust manifold and safely lower the vehicle.

37. Reconnect the timing belt, timing belt cover and crankshaft pulley.

38. Replace the water pump pulley, water pump drive belt, fan shroud and the radiator cooling fan.

39. Replace the vacuum hose for the automatic transmission to the intake manifold, if equipped.

40. Replace the pressure sensor hose to the fuel filter and connect the canister purge hose, if equipped.

41. Replace the fuel return and feed hoses.

42. Connect the ground wires to the distributor assembly.

43. Replace the coil wire. Connect the oxygen sensor and distributor wires to their couplers.

44. Connect the PTC wires to the coupler.

45. Connect the idle speed control valve, throttle position sensor and injector wires to their couplers, if equipped.

46. Reconnect the ground cable, air temperature, oil pressure and water temperature sensor wires to the intake manifold.

47. Replace the throttle opener VSV and EGR VSV wires to their couplers.

48. Connect the accelerator and the automatic transmission kickdown cables, if equipped, to the throttle body.

49. Replace the air valve water hose to the throttle body and connect the brake booster hose to intake manifold.

50. Reconnect the air intake case.

51. Refill the cooling system with the proper coolant and connect the negative battery.

52. Check for any water and oil leaks when finished.

Valve Lash

ADJUSTMENT

Valve lash can be adjusted with the engine hot or cold. Specifications are provided for both adjustments.

1. Remove the air intake case and cylinder head cover.

2. On the 1.3L engine, remove the rubber plug from the transmission case to gain access to the timing marks.

3. Turn the crankshaft clockwise so that;

a. The T mark punched on the flywheel is aligned with the matchmark on the transmission on the 1.3L engine.

Valve lash adjustment

b. The V mark on the crankshaft pulley is aligned with the 0 mark on the timing belt cover on the 1.6L engine.

4. Remove the distributor cap and confirm that the rotor is facing the No. 1 firing position. If the rotor is out of place, turn the crankshaft 360 degrees.

5. With the engine in this position, check the valve lash at valves 1, 2, 5 and 7.

NOTE: The valves are adjusted by loosening the locknut on the valve adjuster and turning the adjusting screw to obtain the proper clearance. Once the proper clearance is obtained, the locknut must be torqued to 11-13 ft. lbs. while holding the adjusting screw. Check the clearance after the locknut is torqued.

Clearance should be: Intake; 0.13-0.17mm (0.0051-0.0067 in.) COLD, 0.23-0.27mm (0.009-0.011 in.) HOT. Exhaust; 0.16-0.20mm (0.0063-0.0079 in.) COLD, 0.26-0.30mm. (0.0102-0.0118 in.) HOT.

6. Rotate the crankshaft 360 degrees, and check the valve lash at valves 3, 4, 6 and 8.

7. After adjusting and checking all the valves, install the cylinder head cover, distributor cover and intake hose.

Rocker Arms/Shfts

REMOVAL & INSTALLATION

NOTE: The rocker arm shafts are not identical and must be kept in the proper order for installation. If the shafts get mixed up before installation, the intake rocker shaft has a 14mm stepped end and the exhaust rocker shaft has a 13mm stepped end. The stepped end of the intake rocker shaft faces the front of the engine and the stepped end of the exhaust rocker shaft faces the rear of the engine.

1. Disconnect the negative battery cable. Drain the cooling system.

2. Remove the front grille (Sidekick and Tracker).

3. Remove the radiator cooling fan and fan shroud. Properly discharge the air conditioning system and remove the air conditioning flexible suction hose, if equipped.

4. Remove the radiator (Sidekick).

5. Remove the water pump drive belt and the water pump pulley.

6. Remove the timing belt outside cover, timing belt and the tensioner.

7. Disconnect the air intake case and remove the cylinder head cover.

8. Remove the camshaft timing belt pulley and timing belt inside cover. Insert the proper size rod into the hole in the camshaft to lock the camshaft and loosen the pulley nut.

9. Loosen all the valve lash adjusting screw locknuts and turn the adjusting screws out all the way.

10. Remove the rocker arm shaft screws.

11. Remove the intake and exhaust rocker arm shafts, rocker arms and springs.

12. Keep all the valve train parts in the order that they were removed.

13. Apply engine oil to the rocker arms, springs and shafts. Install the shafts in the correct direction, into the cylinder head by placing the rocker arms and springs on the shafts as they are installed. With the rocker arms, springs and shafts installed, torque the rocker shaft mounting screws to 7.0-8.5 ft. lbs.

14. Install the timing belt pulley and inside cover by locking the camshaft with the proper size rod.

15. With the camshaft locked, tighten the camshaft pulley bolt to 41-46 ft. lbs.

16. The remainder of the installation is the reverse of the removal procedure.

Intake Manifold

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Drain the cooling system.

2. Remove the air intake case from the manifold.

3. Disconnect the accelerator cable and the automatic transmission kickdown cable, if equipped.

4. Disconnect the injector, throttle position sensor and idle speed control solenoid valve wires at their couplers, if equipped.

5. Disconnect the vacuum hoses from the throttle body and throttle opener. Remove the water hose from the air valve, if equipped.

6. Remove the fuel filler cap to re-

lease the fuel pressure in the fuel tank. Reinstall the cap.

7. Release the fuel pressure in the fuel line.

8. Disconnect the fuel line from the throttle body or carburetor and intake manifold.

9. Remove the fuel return hose.

10. Disconnect the throttle body or carburetor from the intake manifold and remove the PCV hose from the cylinder head cover.

11. Disconnect the pressure sensor hose from the fuel filter, if equipped, and remove the brake booster hose from the intake manifold.

12. Disconnect the vacuum hose for the automatic transmission from the intake manifold, if equipped.

13. Remove the VSV (for throttle opener) hose from the intake manifold.

14. Disconnect the water hose from the thermostat cap. Remove the heater inlet and water bypass hose from the intake manifold.

15. Disconnect the hoses at the EGR valve and remove the ground wire from the intake manifold.

16. Disconnect the wire couplers from the air temperature sensor, water temperature sensor, water temperature gauge and PTC heater, if equipped with automatic transmission.

17. Disconnect the wire harnesses from their clamps.

18. Remove the intake manifold mounting bolts and remove the intake manifold from the cylinder head.

19. Remove the PCV valve, EGR valve, fuel filter, thermostat from the intake manifold.

20. Clean and inspect the sealing surfaces of the intake manifold and the cylinder head.

To install

21. Install the thermostat, fuel filter, EGR valve and PCV valve to the intake manifold.

22. Using a new gasket, install the intake manifold and tighten the mounting bolts to 13-20 ft. lbs.

23. Reconnect the wiring harnesses to their clamps and fasten the wire couplers to the air temperature sensor, water temperature sensor, water temperature gauge and PTC heater, if equipped with automatic transmission.

24. Reconnect the ground wire to the intake manifold and replace the hoses at the EGR valve.

25. Install the water heater inlet and bypass hose to the intake manifold. Replace the water hose to the thermostat cap.

26. Replace the VSV (for throttle opener) hose to the intake manifold.

27. Connect the automatic transmis-

sion vacuum hose to the intake manifold, if equipped.

28. Replace the brake booster hose to the intake manifold and connect the pressure sensor to the fuel filter, if equipped.

29. Reconnect the fuel line to the throttle body or carburetor to the intake manifold.

30. Replace the water hose to the air valve. Connect the vacuum hoses to the throttle body and throttle opener, if equipped.

31. Reconnect the injector, throttle position sensor and idle speed control wires to their couplers, if equipped.

32. Connect the accelerator cable and the automatic transmission kickdown cable, if equipped, to the throttle body.

33. Install the air intake case to the manifold.

34. Refill the cooling system with the proper coolant. Connect the negative battery cable.

35. Check for vacuum, water and oil leaks when finished.

Exhaust Manifold

REMOVAL & INSTALLATION

1. Disconnect the negative cable.
2. Raise and safely support the vehicle.
3. Disconnect the exhaust pipe from the exhaust manifold and lower the vehicle.
4. Disconnect the oxygen sensor lead wire at the coupler and remove the air intake case bracket — 1.6L engine.
5. Disconnect the exhaust manifold upper and lower covers or heat shields from the exhaust manifold.
6. Remove the exhaust manifold mounting bolts and remove the exhaust manifold from the cylinder head.
7. Clean and inspect the sealing surfaces of the exhaust manifold and the cylinder head.
8. Using new gaskets, install the exhaust manifold to the cylinder head and tighten the mounting bolts to 13–20 ft. lbs.
9. The remainder of the installation is the reverse of the removal procedure.
10. Check for exhaust leaks when finished.

Timing Belt Front Cover

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the radiator cooling fan and fan shroud.

3. If equipped, disconnect the air conditioning compressor drive belt, properly discharge the air conditioning system and remove the air conditioning compressor flexible suction hose.

4. Loosen the alternator mounting bolts and remove the water pump drive belt and pulley.

5. Remove the crankshaft mounting bolts and remove the crankshaft pulley.

NOTE: The crankshaft drive belt pulley can be removed without loosening the center crankshaft bolt.

6. Disconnect the timing belt cover mounting bolts and remove the timing belt cover.

7. Clean and inspect all mounting surfaces.

8. Install the timing belt cover and tighten the bolts to 7.0–9.0 ft. lbs.

9. Install the crankshaft pulley. Replace the 5 mounting bolts and tighten to 7.0–9.0 ft. lbs.

10. Install the water pump drive belt pulley and replace the drive belt.

11. Adjust the belt tension and tighten the alternator mounting bolts.

12. Install the air conditioning flexible suction hose and replace the air conditioning compressor drive belt. Adjust the belt tension and properly recharge the air conditioning system, if equipped.

13. Replace the radiator cooling fan and fan shroud.

14. Connect the negative battery cable.

OIL SEAL REPLACEMENT

1. Disconnect the negative battery cable.
2. Remove the the timing belt and the crankshaft sprocket.
3. Insert a suitable tool between the crankshaft and the oil seal and pull the seal outwards to remove it.

NOTE: Use care when removing or installing the oil seal, not to damage the crankshaft or the oil pump sealing surfaces.

4. Clean and inspect the surfaces of the crankshaft and the oil pump assembly.

5. Install the crankshaft sleeve, using the proper tool, onto the crankshaft.

6. Install the new seal over the crankshaft and into the oil pump, making sure that the oil seal lip is not upturned.

7. Install the crankshaft sprocket and the timing belt. Check the timing.

Exploded view of the timing belt and the tensioner assembly

Timing marks on the crankshaft pulley

8. Connect the negative battery cable.

Timing Belt and Tensioner

ADJUSTMENT

1. Disconnect the negative battery cable.
2. Remove the radiator cooling fan and fan shroud.
3. If equipped, disconnect the air conditioning compressor drive belt, properly discharge the air conditioning system and remove the air conditioning compressor flexible suction hose.
4. Loosen the alternator mounting bolts and remove the water pump drive belt and pulley.
5. Remove the crankshaft mount-

ing bolts and disconnect the crankshaft pulley.

NOTE: The crankshaft drive belt pulley can be removed without loosening the center crankshaft bolt.

6. Disconnect the timing belt cover mounting bolts and remove the timing belt cover. Loosen, but do not remove the tensioner bolt.

7. Disconnect the air intake case from the intake manifold.

8. Remove the cylinder head cover and loosen all the valve adjusting screws to permit free rotation of the camshaft.

9. Turn the camshaft pulley clockwise and align the timing marks.

10. Turn the crankshaft clockwise, using a 17mm wrench to crank the timing belt pulley bolt.

11. Align the punch mark on the timing belt pulley with the arrow mark on the oil pump.

12. With the 4 marks aligned, remove any slack from the drive side of the belt. Tighten the tensioner bolt to 17.5–21.5 ft. lbs.

13. To allow the belt to be free of any slack, turn the crankshaft clockwise 2 full rotations. Confirm that the 4 marks are aligned.

14. Replace the timing cover and tighten the bolts to 7.0–8.5 ft. lbs.

15. Adjust the valve lash and install the cylinder head cover, using a new gasket.

16. Connect the air intake case to the throttle body.

17. Install the crankshaft pulley and replace the 5 mounting bolts. Tighten to 7.0–8.5 ft. lbs.

18. Replace the water pump pulley, water pump drive belt and tighten the alternator mounting bolts.

19. Install the air conditioning compressor flexible suction hose and the air compressor belt. Properly recharge the air conditioning system, if equipped.

20. Replace the radiator cooling fan and fan shroud.

21. Connect the negative battery cable.

22. Properly recharge the air conditioning system, if equipped. Run the engine and check for any leaks.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the radiator cooling fan and fan shroud.

3. If equipped, disconnect the air conditioning compressor drive belt, properly discharge the air conditioning system and remove the air condi-

Timing marks on the camshaft pulley

tioning compressor flexible suction hose.

4. Loosen the alternator mounting bolts and remove the water pump drive belt and pulley.

5. Remove the crankshaft mounting bolts and disconnect the crankshaft pulley.

NOTE: The crankshaft drive belt pulley can be removed without loosening the center crankshaft bolt.

6. Disconnect the timing belt cover mounting bolts and remove the timing belt cover. Loosen, but do not remove the tensioner bolt.

7. Disconnect the air intake case from the intake manifold.

8. Loosen the timing belt tensioner adjusting bolt and pivot nut. Hold pressure on the tensioner to loosen the timing belt and remove the timing belt from the camshaft and crankshaft pulleys.

9. Remove the timing belt tensioner, tensioner plate and tensioner spring.

To install

10. Install the timing belt tensioner, plate and spring. Hand tighten the tensioner bolt and stud only at this time.

11. Remove the cylinder head cover and loosen all the valve adjusting screws to permit free rotation of the camshaft.

12. Turn the camshaft pulley clockwise and align the timing marks.

13. Turn the crankshaft clockwise, using a 17mm wrench to crank the timing belt pulley bolt.

14. Align the punch mark on the timing belt pulley with the arrow mark on the oil pump.

15. With the 4 marks aligned, remove any slack from the drive side of the belt. Tighten the tensioner bolt to 17.5–21.5 ft. lbs.

16. To allow the belt to be free of any slack, turn the crankshaft clockwise 2 full rotations. Confirm that the 4 marks are aligned.

17. Install the timing cover and tighten the bolts to 7.0–8.5 ft. lbs.

18. Adjust the valve lash and install the cylinder head cover, using a new gasket.

19. Connect the air intake case to the intake manifold.

20. Install the crankshaft pulley and replace the mounting bolts. Tighten to 7.0–8.5 ft. lbs.

21. Replace the water pump pulley, water pump drive belt and tighten the alternator mounting bolts.

22. If equipped, install the air conditioning compressor flexible suction hose and replace the air conditioning compressor belt.

23. Replace the radiator cooling fan and fan shroud.

24. Connect the negative battery cable.

25. If equipped, properly recharge the air conditioning system. Run the engine and check for any leaks.

Timing Sprockets

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the radiator cooling fan/clutch and fan shroud.

3. If equipped, disconnect the air conditioning compressor drive belt, properly discharge the air conditioning system and remove the air conditioning compressor flexible suction hose.

4. Loosen the alternator mounting bolts and remove the water pump drive belt and pulley.

5. Remove the crankshaft mounting bolts and disconnect the crankshaft pulley.

NOTE: The crankshaft drive belt pulley can be removed without loosening the center crankshaft bolt.

6. Disconnect the timing belt cover mounting bolts and remove the timing belt cover. Loosen, but do not remove the tensioner bolt.

7. Disconnect the air intake case from the throttle body.

8. Remove the cylinder head cover and loosen all the valve adjusting screws to permit rotation of the camshaft.

9. Remove the camshaft timing belt pulley by inserting a proper size rod into the hole in the camshaft to lock the camshaft.

10. Remove the camshaft sprocket mounting bolt, sprocket and sprocket pin.

11. Install the camshaft sprocket pin in the sprocket and replace the sprocket and the bolt on the camshaft.

12. With the camshaft locked, tighten the sprocket bolt to 41–46 ft. lbs.

13. Remove the crankshaft sprocket by using a gear stopper to hold the flywheel (drive plate for automatic transmission vehicles). Remove the crankshaft timing belt pulley bolt, sprocket and key.

14. With the crankshaft locked, install the crankshaft timing belt sprocket and key. Replace the crankshaft pulley bolt and tighten to 47–54 ft. lbs.

15. Align the camshaft and crankshaft timing marks, install the timing belt and tighten the timing belt tensioner.

16. Adjust the valve lash and replace the cylinder head cover.

17. Reconnect the air intake hose to the throttle body.

18. If equipped, install the air conditioning compressor flexible suction hose and replace the air conditioning compressor belt.

19. Install the water pump pulley and replace the water pump drive belt.

20. Replace the radiator cooling fan and fan shroud.

21. Install the water pump pulley and replace the water pump drive belt.

22. Connect the negative battery cable.

23. If equipped, properly recharge the air conditioning system. Run the engine and check for any leaks.

Camshaft

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

Piston arrow marks to the cylinder head

Camshaft removal

2. Remove the cylinder head from the engine block. Place in a suitable place to be able to remove the camshaft from the cylinder head.

3. Remove the distributor, intake and exhaust manifold from the cylinder head. Remove the fuel pump on the Samurai.

4. Disconnect the timing belt gear from the camshaft and remove the rocker arms, springs and rocker arm shafts.

5. Keep all the valve train parts in the order that they were removed.

6. Remove the camshaft from the rear of the cylinder head.

7. To install, lubricate the lobes and journals of the camshaft and the oil seal on the cylinder head with engine oil.

8. Install the camshaft to the cylinder head from the transmission side.

9. For the remainder of the installation use the reverse of the removal procedure.

ENGINE LUBRICATION

Oil Pan

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. On Sidekick and Tracker, drain and remove the front differential assembly from the chassis.
3. Drain the engine oil.
4. Remove the clutch housing lower plate or the torque converter housing lower plate on the Sidekick and Tracker.
5. Remove the oil pan mounting bolts and remove the pan.
6. Clean and inspect the sealing surfaces on the oil pan and the engine block.
7. Using new gaskets, install the oil pan and tighten the oil pan bolts to 7.0–8.5 ft. lbs.

NOTE: Tightening should begin at the center moving outward on both sides.

8. Install the oil drain plug and tighten to 22.0–28.5 ft. lbs.

9. Replace the clutch housing lower plate or the torque converter on the Sidekick and Tracker.

10. Install the front differential assembly to the chassis and fill with differential oil on the Sidekick and Tracker.

Piston and Connecting Rod

POSITIONING

Exploded view of the piston and rod assembly

11. Lower the vehicle.
12. Refill the engine with engine oil. Run the engine and check for leaks.

Oil Pump

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the radiator cooling fan, fan shroud, water pump pulley and water pump drive belt.
3. Remove the timing belt outside cover, timing belt and timing belt tensioner.
4. Disconnect the alternator and remove the bracket, if necessary.

Oil pump installation – bolt location

5. If equipped, properly discharge the air conditioning system and remove the air compressor and bracket.

6. Disconnect the crankshaft timing belt pulley and the timing belt guide.

NOTE: To lock the crankshaft, engage a special tool (gear stopper) with the flywheel ring gear (drive plate ring gear for automatic transmission vehicles). With the crankshaft locked, remove the crankshaft timing belt pulley bolt.

7. Raise and safely support the vehicle. Drain the engine oil.

8. Remove the clutch (torque converter) housing lower plate.

9. Remove the oil pan mounting bolts and remove the oil pan. Disconnect the oil pump strainer.

10. Remove the oil pump mounting bolts and remove the oil pump.

11. Clean and inspect the sealing surfaces of the oil pump and the engine block.

12. Using a new gasket, install the oil pump to the engine.

13. Install the No. 1 and No. 2 mounting bolts and tighten to 7.0–8.5 ft. lbs.

NOTE: To prevent the oil seal lip from being damaged when installing the oil pump to the crankshaft, use a proper seal guide tool when installing. After installing the oil pump, check to be sure that the oil lip is not upturned, then remove the special tool. The edge of the oil pump gasket might bulge out. If it does, cut off bulge with knife.

14. With the crankshaft locked, install the crankshaft timing belt guide and the timing belt pulley.

15. Replace the clutch (torque converter) housing lower plate.

16. If equipped, replace the air conditioning bracket, the air conditioning compressor and properly recharge the air conditioning system.

17. Replace the alternator and the alternator bracket, if necessary.

18. Reinstall the timing belt tensioner, timing belt and timing belt outside cover.

19. Replace the water pump drive belt, water pump pulley, radiator cooling fan and fan shroud.

20. Refill the engine with engine oil and connect the negative battery cable.

21. Run the engine and check for any leaks.

CHECKING

With the oil pump removed from the engine, certain clearances must be

checked on the oil pump, if it is being reused.

1. The radial clearance is the clearance between the oil pump outer rotor and the oil pump case. The maximum clearance is 0.0122 in.

2. The side clearance is measured with a straightedge across the mounting surface of the oil pump. The measurement is taken between the oil pump gears and the straightedge. The maximum clearance is 0.0059 in.

Rear Main Bearing Oil Seal

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Support the engine and remove the transmission from the vehicle.

3. Disconnect the clutch and flywheel, for manual transmission vehicles or the drive plate, for automatic transmission vehicles.

4. Using a suitable tool, remove the seal by pulling it outwards. Use care not to damage the sealing surface of the crankshaft.

5. Clean and inspect the sealing surfaces of the crankshaft and seal housing.

6. Using a seal driver, install the new seal into the seal housing with the lip of the seal facing the engine.

7. Install the flywheel and clutch, for manual transmission vehicles or the drive plate, for automatic transmission vehicles.

8. Install the transmission in the vehicle.

9. Lower the vehicle and check all the fluids. Run the engine and check for any leaks.

MANUAL TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transmission Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the console cover, remove the 4 gear shift boot mounting

bolts and slide the boot upwards on the gear shifter.

3. On Samurai, loosen the 3 gear shift lever mounting bolts and remove the gear shift lever.

4. On Sidekick and Tracker, remove the boot clamp and remove the second boot from the shift lever case.

5. Push the gear shift lever control case down with fingers, turn it counterclockwise and remove the shift control lever.

6. Remove the transfer case shift control lever the same way.

7. Disconnect the breather hose and clamp at the rear of the cylinder head.

8. Remove the clamp at the rear of the intake manifold to free up the wiring harness. Disconnect the harness coupler.

9. Raise and safely support the vehicle. Drain the oil from the transmission and the transfer case.

10. Disconnect the starter lead wires and mounting bolts and remove the starter.

11. Remove the fuel line clamp on the transmission. Disconnect the bolts fastening the engine to the transmission.

12. Disconnect the flange bolts from the front driveshaft and remove and mark the shaft.

13. Disconnect the flange bolts from the rear driveshaft and remove and mark the shaft.

14. Disconnect the clutch cable and remove the clutch housing lower plate.

15. Disconnect the center exhaust pipe and remove the nuts from the joint with the engine.

16. Disconnect the speedometer cable from the transfer case.

17. Position a transmission jack and remove the engine rear mounting member from the vehicle. Move the transmission and transfer case rearwards and lower.

18. Disconnect the wiring harness and breather hose at the transmission.

19. Separate the gear shift lever case and transfer case from the transmission. Remove the transmission from the vehicle.

20. Install the gear shift lever case and transfer case to the transmission.

21. Install the transmission wiring harness and breather hose.

22. Raise the transmission and transfer case on the transmission jack and place under the vehicle.

23. Install the engine rear mounting member and tighten the bolts.

24. Connect the speedometer cable to the transfer case and joint with the engine.

25. Remove the transmission jack and replace the center exhaust pipe.

26. Replace the clutch housing lower plate and connect the clutch cable.

27. Install the front and rear drive-shaft and replace the flange bolts.

28. Connect the bolts attaching the engine to the transmission and replace the fuel line clamp on the transmission.

29. Install the starter and replace the mounting bolts and the lead wires to the starter.

30. Lower the vehicle. Refill the transmission and transfer case with the recommended gear oil.

31. Connect the wiring coupler and replace the clamp holding the wiring harness at the rear of the intake manifold.

32. Replace the breather hose and clamp at the rear of the cylinder head.

33. Install the transfer case and the gear shift control levers. Replace the gear shift lever boots and the console cover.

34. Connect the negative battery cable. Run the engine and check for any leaks.

35. Observe the following torques during installation: Samurai transmission mount bolts, 13–20 ft. lbs., driveshaft bolts, 17–21 ft. lbs. Sidekick and Tracker engine rear mount bolts, 37 ft. lbs., driveshaft bolts, 37 ft. lbs.

CLUTCH

Clutch Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Raise and safely support the vehicle.

3. Support the engine and remove the transmission from the vehicle.

4. Support the pressure plate and remove the 6 pressure plate to flywheel mounting bolts.

5. Remove the pressure plate and the clutch disc from the flywheel.

6. Inspect the condition of the flywheel, pressure plate and clutch disc and replace as necessary.

7. Remove the flywheel mounting bolts and remove the flywheel.

8. Install the new flywheel and replace the mounting bolts, tighten to 41–47 ft. lbs.

9. Inspect the condition of the clutch release bearing and the input shaft bearing and replace if necessary.

10. Align the clutch disc to the flywheel using a clutch disc alignment tool.

11. Install the pressure plate and evenly tighten the pressure plate bolts to 13–20 ft. lbs.

Exploded view of the clutch assembly

NOTE: Before assembling, make sure that the clutch disc and the pressure plate are clean and dry.

12. With the engine supported, install the transmission in the vehicle.

13. Lower the vehicle. Connect the negative battery cable.

14. Check and adjust the clutch pedal height. Check the clutch operation when finished.

7. Install the cable after first applying grease to the cable end hook and the joint pin.

8. The remainder of the installation is the reverse of the removal procedure.

PEDAL HEIGHT/FREEPLAY ADJUSTMENT

The only adjustment possible is the clutch pedal free play. The free play is adjusted by moving the joint nut on the release bearing arm. Clutch linkage free play should be between 0.8–1.1 in. (Samurai), 0.6–1.1 in. (Sidekick and Tracker).

Clutch Cable

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Raise and safely support the vehicle.

3. Disconnect the cable adjusting nuts on the clutch release and remove the adjusting nuts on the cable support bracket.

4. Disconnect the clutch cable from the 3 cable clamps.

5. Remove the clutch cable support bolts. Lower the vehicle.

6. Disconnect the cable hook at the clutch pedal shaft arm and remove the clutch cable.

1. Inner cable
2. Joint nut
3. Joint pin
4. Clutch release arm
5. Cable outer nut
6. Clutch cable bracket

Clutch cable free travel adjustment

Clutch pedal height adjustment

ADJUSTMENT

Adjust the clutch pedal height by adjusting the bolt located on the pedal bracket so that the clutch pedal exceeds the height of the brake pedal by 5mm (0.2in.). Tighten the locknut.

AUTOMATIC TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transmission Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Disconnect the transmission shift control lever and remove the transfer case shift control lever knob.
3. Disconnect the breather hose from the clamp at the rear of the cylinder head.
4. Disconnect the wiring harness clamp at the rear end of the intake manifold to free up the harness.
5. Disconnect the wiring harness coupler and remove the detent cable at the throttle body, if equipped.
6. Remove the vacuum modulator hose at the intake manifold.
7. Raise and safely support the vehicle.
8. Disconnect the starter lead wires and mounting bolts, remove the starter motor.
9. Drain the oil from the transmission and transfer case.
10. Disconnect the flange bolts from the front driveshaft, remove and mark the shaft.
11. Disconnect the flange bolts from the rear driveshaft, remove and mark the shaft.
12. Disconnect the select cable from the transmission and the speedometer cable from the transfer cases.
13. Remove the torque converter housing lower plate and disconnect and plug the oil cooler lines.
14. Disconnect the transfer case skid plate and remove the kickdown cable from the transmission.
15. Remove the exhaust bracket at the catalytic converter and at the transmission. Disconnect the center exhaust pipe, if necessary.

Adjusting the shift cable assembly

16. Remove the transmission to engine retaining bolts and nuts.
17. Support the transmission using a transmission jack or equivalent. Disconnect the transmission crossmember mounting bolts and remove the crossmember.
18. Disconnect the lead wires and breather hose at the transmission and lower the transmission with the transfer case from the vehicle. Remove the torque converter to flywheel bolts.
19. Disconnect the transmission-to-transfer case bolts and separate the transmission from the transfer case.
20. Connect the transfer case to the transmission and tighten the bolts to 20 ft. lbs. Replace the torque converter to flywheel bolts.
21. Raise the transmission, connect the lead wires and breather to the transmission.
22. Replace the transmission to engine retaining bolts and tighten to 62 ft. lbs.
23. Install the transmission crossmember and tighten the bolts to 62 ft. lbs.
24. Connect the exhaust bracket to the catalytic converter and the transmission.
25. Reconnect the center exhaust pipe, if necessary.
26. Connect the transfer case skid plate and replace the kickdown cable to the transmission.
27. Replace the torque converter housing lower plate and connect the transmission cooler lines.
28. Reconnect the select cable to the transmission and the speedometer cable to the transfer case.
29. Replace the front and rear driveshafts and tighten the flange bolts to 37 ft. lbs.
30. Install the starter and connect the lead wires to the starter.
31. Lower the vehicle and connect the vacuum modulator hose to the intake manifold.
32. Connect the wiring coupler at the rear of the intake manifold and replace

the wiring harness clamp in the proper position.

33. Connect the breather hose to the clamp at the rear of the cylinder head.

34. Install the transmission shift control lever and replace the transfer case shift control lever knob.

35. Connect the negative battery cable and refill the transmission. Run the engine and check for leaks.

SHIFT LINKAGE ADJUSTMENT

1. Adjust the shift cable assembly by moving the shift selector to the N position and placing a pin in the selector to hold that position.
2. Put the manual select lever in L position and set the cable to the cable bracket with the E-clip.
3. Adjust the manual select lever back to the N position and tighten the cable end locknut to 5 ft. lbs.

NOTE: When the manual selector is moved to the N position, there should be a little clearance between the lever and the adjusting nut.

THROTTLE LINKAGE ADJUSTMENT

Adjust the cable by loosening the cable locknut and adjust the cable to specifications. The cable endplay should be (0.12–0.20 in.) when the throttle valve is in the idle position.

DETENT CABLE ADJUSTMENT

1. Make sure accelerator play is within specifications.
2. Loosen the kickdown cable nut and adjusting nut.
3. With the accelerator pedal fully depressed and the cable pulled towards the firewall, adjust the locknut-to-bracket clearance to (0.039 in.) by turning the locknut

NOTE: When adjusting the clearance make sure that the adjusting nut does not rub against the bracket.

4. Release the accelerator pedal and adjust the locknut-to-bracket clearance by tightening the adjusting nut. Tighten the locknut securely.

TRANSFER CASE

Transfer Case Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Raise and safely support the vehicle.
3. Support the transmission and transfer case using a suitable transmission jack.
4. Disconnect the speedometer cable from the transfer case.
5. Remove the transmission and transfer case from the vehicle.
6. Remove the 10 transmission-to-transfer case mounting bolts and separate the transfer case from the transmission.
7. Installation is the reverse of the removal procedure.

Exploded view of the halfshaft assembly

2. Matchmark the driveshafts to the yokes on the transfer case and the differential.
3. Drain the transfer case oil (when servicing the front driveshaft shaft).
4. Support the driveshaft and remove the attaching bolts.
5. Remove the driveshaft from the vehicle.
6. Install the driveshaft, by aligning the matchmarks to the vehicle.
7. Tighten the mounting bolts to 17-21 ft. lbs. on Samurai and 37 ft. lbs. on Sidekick and Tracker.
8. Refill the transfer case and lower the vehicle.

9. Installation is the reverse of the removal procedure. Refill the front differential with the proper fluid when finished.

10. Observe the following torques during the installation: joint seal bolts, 6.0-8.5 ft. lbs.; tie rod nut, 22-39 ft. lbs.; king-pin bolts, 14-21 ft. lbs.

DRIVE AXLE

Halfshaft

REMOVAL & INSTALLATION

Sidekick and Tracker

1. Raise and safely support the vehicle. Drain the transmission.
2. Remove the front wheels and disconnect the locking hubs.
3. Disconnect the halfshaft snaprings and remove the stabilizer bar links.
4. Disconnect the tie rod ends and remove the brake caliper and brake disc. Support the brake caliper.
5. Disconnect the wheel hub and remove the steering knuckle.
6. Disconnect the differential side joint snapring and remove the right side halfshaft by prying the joint away from the differential assembly.
7. Disconnect the left side halfshaft bolts and remove the halfshaft from the left inner axle flange.
8. Installation is reverse of the removal procedure.
9. Torque the axle shaft bolts to 37 ft. lbs.

Driveshaft and U-Joints

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

Front Axle Shaft

REMOVAL & INSTALLATION

Samurai

1. Raise and safely support the vehicle.
2. Drain the oil in the front differential.
3. Remove the front wheels and disconnect the brake caliper. Support the brake caliper.
4. Disconnect the tie rod end from the steering knuckle. The tie rod end removal may require the use of a puller.
5. Remove the 8 oil seal cover mounting bolts and disconnect the felt pad, oil seal and the retainer from the steering knuckle.
6. Mark the upper and lower king pins. Remove the 4 mounting bolts and disconnect the king pins from the steering knuckle.
7. Remove the axle shaft from the housing with the steering knuckle attached.
8. Transfer the steering knuckle to the new axle.

Front Axle Shaft, Bearing and Seal

REMOVAL & INSTALLATION

Samurai

1. Raise and safely support the vehicle. Drain the front differential assembly.
2. Disconnect the front wheel hub and remove the bearing.
3. Support the hub and drive out the seal in the hub.
4. Using a seal driver, install the new seal in the hub until it is flush with the hub face. Apply a thin film of oil to the lip of the seal before installation to the vehicle.
5. Install the hub and the bearing to the vehicle.
6. Refill the front differential assembly and safely lower the vehicle.

Rear Axle Shaft, Bearing and Seal

REMOVAL & INSTALLATION

Samurai

1. Raise and safely support the vehicle. Drain the rear differential assembly.
2. Make sure that the rear brake is released.
3. Remove the rear wheels and re-

move the rear brake drums from the vehicle.

4. Disconnect the parking brake cables from the levers. Remove the parking brake lever stop plates.

5. Disconnect and plug the brake lines to the wheel cylinders.

6. Remove the backing plate mounting bolts.

7. Remove the rear axles with the backing plates attached using a slide hammer type puller.

8. Using a suitable tool, remove the axle seal from the housing.

9. If the axle, axle bearing or backing plate is being replaced, support the axle in a vise with additional support under the shaft next to the bearing.

CAUTION

Eye protection must be worn during the 3 steps. Failure to do so could cause injury.

10. With the axle shaft supported properly, grind the top and bottom of the axle bearing retainer to remove it without damaging the axle shaft.

11. Using a chisel, finish removing the retainer from the axle shaft.

12. Using a press or suitable bearing puller, remove the axle shaft bearing from the axle shaft.

13. Remove the backing plate from the axle shaft.

14. Using a seal driver, install the new seal with the lip facing the housing to the same depth as the old seal.

15. Install the backing plate on the axle shaft and using a press, install the bearing and the retainer on the axle shaft.

16. Install the axle shaft in the housing.

17. Replace the backing plate mounting bolts and connect the brake lines to the wheel cylinders.

18. Replace the parking brake lever plates and connect the brake cables to the parking brake lever.

19. Install the rear brake drums and replace the rear wheels.

20. Adjust the brakes and bleed the brake system.

21. Refill the rear differential and safely lower the vehicle.

Sidekick and Tracker

1. Raise and safely support the vehicle.

2. Remove the rear wheels and remove the rear brake drums from the vehicle.

3. Drain the gear oil from the rear axle housing.

4. Remove the rear wheel bearing retainer nuts from the rear axle housing.

5. Using a suitable tool, remove the axle shaft from the housing.

NOTE: Do not remove the backing plate with the axle. This may cause damage to the inner seal.

6. If the axle, axle bearing or backing plate is being replaced, support the axle in a vise with additional support under the shaft next to the bearing.

CAUTION

Eye protection must be worn during the 3 steps. Failure to do so could cause injury.

7. With the axle shaft supported properly, grind the top and bottom of the axle bearing retainer to remove it without damaging the axle shaft.

8. Using a chisel, finish removing the retainer from the axle shaft.

9. Using a press or suitable bearing puller, remove the axle shaft bearing from the axle shaft.

10. Using a suitable tool, remove the seal from the axle housing.

11. Using a seal driver, install the new seal with the lip facing the housing to the same depth as the old seal.

12. Install the new bearing and the retainer on the axle shaft using a suitable press.

13. Install the axle shaft in to the rear axle housing and replace the rear wheel bearing retaining nuts, tighten to 17 ft. lbs.

14. Replace the rear brake drums and replace the rear tires on the vehicle.

15. Refill the rear axle housing with the proper gear oil and safely lower the vehicle.

Front Wheel Hub, Knuckle and Bearings

REMOVAL & INSTALLATION

Samurai

1. Raise and safely support the vehicle. Remove the front wheels.

2. Disconnect the locking hub. Remove the caliper mounting bolts and move the caliper out of position with the brake line attached.

NOTE: Do not allow the caliper to hang on the brake hose. Support it by the mounting bracket.

3. Install 2 (8mm) bolts into the threaded holes and tighten evenly. This will remove the rotor from the hub assembly.

4. Remove the front axle shaft cap and the circlip. Remove the drive flange from the steering knuckle.

5. Straighten the bent lock washer and remove the hub nut and washer.

6. Remove the front wheel hub and bearing from the spindle.

7. Remove the oil seal and race from the wheel hub.

8. Clean and inspect the hub and bearing seats. Install the new bearing, race and grease seal in the same position.

9. Loosen the upper and lower king pin bolts, but do not remove the king pins.

10. Disconnect the disc dust cover and remove the spindle.

11. Disconnect the tie rod end from the steering knuckle.

12. Remove the 8 joint seal cover bolts and remove the cover, pad, oil seal and retainer from the knuckle.

13. Mark the upper and lower king pins. Remove the 4 mounting bolts and disconnect the king pins from the steering knuckle.

14. Remove the steering knuckle while noting the upper from the lower king pin positions during the removal of the knuckle.

15. Install the king pin bearings in the new knuckle and install the knuckle to the vehicle.

16. Install the king pins and tighten the mounting bolts to 14-21 ft. lbs.

17. Replace the joint seal cover, pad oil seal and retainer. Tighten the joint seal cover bolts to 6.0-8.5 ft. lbs.

18. Connect the tie rod end to the steering knuckle.

19. Replace the spindle and connect disc dust cover.

20. Install the front wheel hub and bearing to the spindle.

21. Install the front hub nut and lock washer and replace the drive flange to the steering knuckle.

22. Install the front axle cap and circlip. Connect the rotor to the hub assembly.

23. Place the brake caliper into position and replace the caliper mounting bolts.

24. Reconnect the locking hub assembly and replace the front wheels.

25. Lower the vehicle.

Sidekick and Tracker

1. Disconnect the negative battery cable. Raise and safely support the vehicle.

2. Remove the wheels and disconnect the locking hub assembly.

3. Remove the caliper mounting bracket and position the caliper out of the way. Support the caliper.

4. Disconnect the front wheel bearing lock plate and washer and remove the wheel hub complete with bearings and seals.

5. Remove the oil seal and race from the wheel hub.

6. Clean and inspect the hub and bearing seats. Install the new bearing, race and grease seal in the same position.

7. Support the suspension with a jack and remove the dust cover.

Wheel hub position

8. Disconnect the spindle by tapping with a hammer.

9. Remove the strut bracket bolts from the steering knuckle.

10. Disconnect the tie rod end from the knuckle and the knuckle from the control arm.

11. Remove the dust seal and the spindle from the knuckle.

12. Install the new seal and the spindle to the knuckle.

13. Connect the knuckle to the ball joint and tighten the nut to 40 ft. lbs.

14. Connect the knuckle to the strut damper and tighten the bolts to 66 ft. lbs.

15. Replace the tie rod end to the knuckle and tighten the nut 30 ft. lbs.

16. Install the spindle and replace the dust cover and remove the jack from under the suspension.

17. Install the wheel hub assembly and connect the locking hub.

18. Replace the wheels and lower the vehicle.

19. Connect the negative battery cable.

Manual Locking Hubs

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable and remove the locking hub cover.

2. Raise and support the vehicle safely.

3. Remove the locking hub body assembly.

NOTE: The manual locking hubs must not be packed with grease.

4. Install a new O-ring to the locking hub assembly.

5. Install the locking hub body assembly to the wheel hub flange and tighten the hub body bolts to 18 ft. lbs.

6. Install a new gasket in the manual locking hub cover.

7. Replace the locking hub cover and connect the negative battery cable.

8. Lower the vehicle.

NOTE: The 0 mark on the hub knob must be in the FREE position. Tighten the locking hub cover bolts to (106 inch lbs.).

Automatic Locking Hubs

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable and remove the automatic locking hub cover.

2. Disconnect the automatic hub body assembly.

3. Install a new O-ring to the automatic locking hub body assembly.

4. Connect the automatic locking hub body assembly to the wheel hub flange. Tighten the hub body assembly bolts to 18 ft. lbs.

5. Install a new gasket in the automatic locking hub cover and replace the hub cover.

6. Connect the negative battery cable.

Pinion Seal

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Matchmark and remove the driveshaft.

3. Check the turning torque of the pinion before proceeding.

4. Using a pinion flange holding tool, remove the pinion nut and the washer.

5. Remove the pinion flange from

the differential carrier and pry out the pinion seal.

6. Clean and inspect the sealing surface of the carrier.

7. Using a seal driver, install the new seal into the carrier until the flange of the seal is flush with the carrier.

NOTE: Tightening the flange nut will preload the pinion bearings. Exceeding the preload specifications will compress the collapsible spacer to far and require the spacer to be replaced.

8. Install the pinion flange and using the pinion flange holding tool, replace the pinion nut and washer. Tighten the pinion nut to the same torque as before.

9. Align the matchmarks and install the driveshaft.

10. Check the level of the differential fluid when finished.

Differential Carrier

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Drain the oil from the rear differential.

2. Remove the left and right axle shafts.

3. Disconnect the driveshaft.

4. Remove the 4 mounting bolts to the upper rear suspension arm.

5. Support the differential carrier with a proper jack.

6. Remove the differential case nuts and lower the differential assembly from the rear housing.

7. Clean and inspect the sealing surfaces of the carrier and the housing.

8. Using a liquid sealant on the carrier, install the carrier in the housing and tighten the nuts to 13-20 ft. lbs.

9. Replace the 4 mounting bolts to the upper rear suspension arm and tighten to 41 ft. lbs.

10. Connect the rear driveshaft and replace the left and rear axles.

11. Refill the rear differential to the proper level with SAE 75W-90W API GL5 Hypoid Gear Oil.

12. Lower the vehicle.

Front Axle Housing

REMOVAL & INSTALLATION

Samurai

1. Raise and safely support the vehicle. Remove the rear wheels.

2. Matchmark and remove the front driveshaft.

3. Disconnect and plug the brake lines at the brake calipers.

4. Remove the housing to leaf springs U-bolts and nuts.

5. Slide the housing to one side while tilting the opposite side under the leaf spring.

6. Remove the housing from the vehicle.

7. Installation is the reverse of the removal procedure. Torque the housing U-bolt nuts to 43–57 ft. lbs.

8. Refill the differential with the proper lubricant and bleed the brake system when finished.

Rear Axle Housing

REMOVAL & INSTALLATION

Samurai

1. Raise and safely support the vehicle. Drain the rear differential assembly.

2. Make sure that the parking brake is in the released position.

3. Remove the rear wheels and remove the rear brake drums from the vehicle.

4. Disconnect the parking brake cables from the levers. Remove the parking brake lever stop plates.

5. Disconnect and plug the brake lines to the wheel cylinders.

6. Remove the backing plate mounting bolts and remove the axle shafts with the backing plates attached.

7. Remove the differential carrier assembly.

8. Remove the brake line from the flexible hose and remove the E-clip.

9. Disconnect the brake clamps and remove the brake lines from the rear housing.

10. Disconnect the driveshaft and remove from the transmission.

11. Disconnect the mounting bolts to the rear suspension arm and remove the housing to leaf spring U-bolts and nuts.

12. Remove shock absorber lower mount bolt.

13. Slide the housing to one side while tilting the opposite side under the leaf spring and remove the housing from the vehicle.

14. Installation is the reverse of the removal procedure. Torque the housing U-bolts to 43–57 ft. lbs.

15. Refill the differential and bleed the brake system when finished.

Sidekick and Tracker

1. Raise and safely support the vehicle. Drain the rear differential assembly.

2. Make sure that the parking brake is in the released position.

3. Remove the rear wheels and remove the rear brake drums from the vehicle.

4. Disconnect the parking brake cables from the levers. Remove the parking brake lever stop plates.

5. Disconnect and plug the brake lines to the wheel cylinders.

6. Remove the rear wheel bearing retainer nuts and remove the axle shafts from the vehicle. Do not remove the axle shafts with the backing plates attached.

7. Remove the rear axle carrier assembly.

8. Disconnect the brake line from the flexible hose and remove the E-clip. Remove the brake lines from the rear housing.

9. Remove the breather hose from the axle housing and disconnect the rear driveshaft.

10. Support the rear axle housing with a suitable jack.

11. Remove the ball joint bracket from the differential carrier and remove the carrier assembly.

12. Loosen the rear mount nut of the trailing rod. Do not remove it.

13. Disconnect the shock absorber lower mount bolt.

14. Lower the jack to relieve the tension of the coil springs and remove the rear mount bolt of the trailing rod.

15. Remove the rear axle housing.

16. Place the rear axle housing on a jack and install the trailing rod rear mounting bolts. Mount the nuts but do not tighten.

17. Install the coil spring on the spring seat and raise the axle housing.

18. Replace the shock absorber lower mounting bolts. Do not tighten.

19. Install the differential carrier assembly and replace the rear upper ball joint bracket onto the carrier assembly and tighten to 37 ft. lbs.

20. Install the rear driveshaft and remove the jack from under the axle housing.

21. Replace the breather hose and brake lines to axle housing. Tighten them securely.

22. Connect the flexible brake hose to the bracket on the axle housing and secure with the E-clip.

23. Tighten the trailing rod nuts and the shock absorber nuts to 66 ft. lbs.

24. Install the brake line to the flexible hose and replace the axle shafts.

25. Install the brake lines to the wheel cylinders and replace the brake drums.

26. Install the wheels and refill the rear differential assembly.

27. Bleed the brake system and lower the vehicle.

STEERING

Steering Wheel

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Disconnect the horn button and remove the steering wheel shaft nut.

3. Make matchmarks on the steering wheel and the shaft to use as a guide during reinstallation.

4. Remove the steering wheel, using a suitable steering wheel puller.

5. Install the steering wheel onto the shaft, aligning the matchmarks.

6. Install and tighten the shaft nut to 24 ft. lbs.

7. Install the horn button and connect the negative battery cable.

Manual Steering Gear

REMOVAL & INSTALLATION

Samurai

1. Remove the steering shaft coupler bolt and disconnect the coupler from the steering box. As required, raise and support the vehicle safely.

2. Remove the radiator under cover and disconnect the ball stud of the drag rod. Remove the steering damper from the pitman arm.

3. Support the steering gear and remove the mounting bolts.

4. Remove the steering gear from the vehicle.

5. Installation is the reverse of the removal procedure.

6. Torque the steering gear mounting bolts to 51–65 ft. lbs., the steering shaft joint flange bolt to 14–21 ft. lbs., the steering damper nut to 25–39 ft. lbs.

Sidekick and Tracker

1. As required, raise and support the vehicle safely. Disconnect the steering lower shaft mounting bolts.

2. Disconnect the center link end from the pitman arm.

3. Remove the 3 steering gear box mounting bolts.

4. Disconnect the steering lower shaft joint and remove the steering gear.

5. Install the steering gear box by connecting to the lower shaft joint.

NOTE: Align the flat part of the steering gear worm shaft with the bolt hole of the lower shaft joint.

6. Replace the steering gear box

Adjusting the steering gear assembly

mounting bolts and tighten to 50–72 ft. lbs.

7. Attach the center link to the pitman arm and tighten the nut to 22–50 ft. lbs.

8. Connect the lower shaft mounting bolts and tighten to 14–22 ft. lbs.

ADJUSTMENT

1. Check the worm shaft to make sure it is free from thrust play.

2. Place the pitman arm in a position that is nearly parallel with the worm shaft.

3. With the pitman arm in this position, the front wheels are in a straight forward position.

4. Measure the worm shaft starting torque from its straight forward position. The torque should be 0.4–0.7 ft. lbs.

5. Adjust the worm shaft adjusting bolt to specifications.

Power Steering Gear

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the coolant reservoir tank from the radiator.

3. Disconnect the steering column lower shaft from the gear box.

4. Raise and safely support the vehicle.

5. Remove the center link nut and lock washer and disconnect the center link from the pitman arm, using a pitman arm puller.

6. Lower the vehicle. Remove the pressure hose from the power steering gear assembly and plug.

7. Disconnect the return hose and plug. Remove the 3 power steering gear mounting bolts.

8. Remove the power steering gear. Disconnect the pitman arm from the

gear assembly, note the alignment marks.

9. Align the matchmarks on the pitman arm and the power steering gear sector shaft. Install the pitman arm to the gear assembly and tighten the nut to 95 ft. lbs.

10. Install the power steering gear assembly on the vehicle and tighten the mounting bolts to 72 ft. lbs.

11. Connect the power steering pressure and return hoses.

12. Raise and safely support the vehicle.

13. Install the center link to the pitman arm and tighten the nut to 40 ft. lbs. Lower the vehicle.

14. Connect the steering column lower shaft to the gear assembly and tighten the bolts to 29 ft. lbs.

15. Install the coolant reservoir tank to the radiator. Refill the power steering pump.

16. Connect the negative battery cable. Run the engine and operate the power steering. Recheck the fluid level and for any leaks.

ADJUSTMENT

1. Check the worm shaft to make sure it is free from thrust play.

2. Place the pitman arm in a position that is nearly parallel with the worm shaft.

3. With the pitman arm in this position, the front wheels are in a straight-forward state.

4. Measure the worm shaft starting torque from its straightforward state. The torque should be 0.4–0.7 ft. lbs.

5. Adjust the worm shaft adjusting bolt to specifications.

Power Steering Pump

REMOVAL & INSTALLATION

NOTE: Before disconnecting the power steering pressure and return line at the pump assembly, make sure any dirt or grease is removed.

1. Disconnect the negative battery cable. Remove the coolant reservoir tank from the radiator.

2. Loosen the air conditioning compressor adjusting and pivot bolts, if equipped.

3. Loosen the power steering pump adjusting and mounting bolts, if not equipped with air conditioning.

4. Remove the power steering belt.

5. Disconnect the power steering pressure and return hose and plug.

6. Disconnect the power steering pressure switch lead wire at the switch terminal.

7. Remove the engine oil filter.

8. Remove the power steering pump mounting and adjusting bolts.

9. Remove the power steering pump.

10. Install the power steering pump and replace the pump mounting bolts. Do not tighten.

11. Install the power steering pump pressure switch lead wire to the switch terminal.

12. Replace the power steering pressure and return hoses.

13. Install the power steering belt and tighten the power steering pump mounting bolts to 21 ft. lbs.

14. Tighten the air conditioning mounting bolts to 21 ft. lbs., if equipped.

15. Replace the coolant reservoir tank to the radiator and connect the negative battery cable. Refill the power steering pump.

16. Replace the oil filter and fill the crankcase to the proper level.

17. Run the engine and operate the power steering. Recheck the fluid level and for any leaks.

BELT ADJUSTMENT

1. To adjust the power steering belt tension, loosen the adjusting bolt of the air conditioning compressor, if equipped, or that of the power steering pump for vehicles without air conditioning.

2. Adjust the belt tension to (0.24–0.35 in.) deflection, using the proper belt tension gauge.

3. Tighten the proper adjusting and mounting bolts to the specified torque.

SYSTEM BLEEDING

1. Raise and support the vehicle safely.

2. Fill the power steering reservoir to the specified level.

3. Run the engine for 3 to 5 minutes, stop it and add fluid if necessary to reach specified level.

4. With the engine stopped, turn the steering wheel to the left and to the right as far as it turns. Repeat a few times and refill the reservoir.

5. With the engine running at idle speed, bleed air from the system by loosening the bleeder valve at the gear assembly.

6. Repeat the stop to stop turn of the steering wheel until all the foam is gone.

7. Tighten the bleed valve securely. Recheck the fluid level in the reservoir.

NOTE: When air bleeding is not complete, it is indicated by a foaming fluid on the level indicator or a humming noise from the power steering pump.

Tie Rod Ends

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle and remove the wheels.
2. Remove the tie rod end from the steering knuckle, using a suitable tie rod end remover tool.
3. Mark the tie rod end locknut position on the tie rod thread.
4. Loosen the locknut and remove the tie rod end from the tie rod.
5. Install the tie rod end locknut and the tie rod end to the tie rod. Align the locknut with the mark on the tie rod thread and tighten the locknut to 48 ft. lbs.
6. Connect the tie rod end to the steering knuckle. Tighten the castle nut until the holes of the split pin are aligned, but only within the specified torque 33 ft. lbs.

BRAKES

Master Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the air cleaner case.
2. Disconnect the reservoir lead wire on the Sidekick and the Samurai.
3. Clean the outside of the reservoir and remove the fluid from the reservoir.
4. Disconnect and plug the brake fluid lines at the master cylinder.
5. Remove the master cylinder to booster mounting bolts and remove the master cylinder.
6. Install the new master cylinder and tighten the mounting bolts to 12 ft. lbs.
7. Install the hydraulic brake lines to the master cylinder and tighten and tighten the flare nuts to 13 ft. lbs.
8. Replace the reservoir lead wire, if equipped.
9. Fill the reservoir with the specified brake fluid. Replace the air cleaner case.
10. Bleed the air from the brake hydraulic system and check the brake pedal play.

Proportioning Valve

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. Disconnect and plug the hydraulic brake lines from the proportioning valve assembly.

lic brake lines from the proportioning valve assembly.

3. Remove the proportioning valve from the vehicle body.

NOTE: The proportioning valve should be removed with the spring attached.

4. Install the proportioning valve to the vehicle body and tighten the mounting bolts to 20 ft. lbs.

5. Connect the hydraulic brake lines to the proportioning valve and tighten the flare nuts to 13 ft. lbs.

6. Fill the brake reservoir to the proper level and bleed the brake hydraulic system. Lower the vehicle.

NOTE: Bleed the air from the proportioning valve bleeder valve.

Power Brake Booster

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the air cleaner case.
2. Remove the fluid from the brake reservoir and remove the master cylinder.
3. Disconnect the vacuum hose from the booster. Remove the pushrod clevis pin and cotter pin from the brake pedal arm.
4. Disconnect the brake booster mounting nuts and remove the brake booster from the vehicle.
5. Disconnect the pedal attachment from the booster.
6. Connect the pedal attachment to the booster and install the booster to the vehicle. Tighten the mounting nuts to 7.5–11.5 ft. lbs.

Exploded view of the front disc brake assembly

7. Install the pushrod clevis pin and cotter pin to the brake pedal arm.

8. Connect the vacuum hose to the booster and install the master cylinder to the booster.

9. Replace the air cleaner case and connect the negative battery cable.

10. Fill the brake reservoir and bleed the brake hydraulic system.

Brake Caliper

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and safely support the vehicle.
2. Remove the wheels. Disconnect and plug the brake line.
3. Remove the caliper mounting bolts and remove the caliper from the vehicle.
4. Install the caliper on the vehicle. Tighten the mounting bolts to 65 ft. lbs.
5. Connect the hydraulic brake line, using 2 new washers. Replace the front wheels.
6. Lower the vehicle. Connect the negative battery cable.
7. Fill the brake reservoir and bleed the hydraulic brake system.

Disc Brake Pads

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and safely support the vehicle.
2. Remove the wheels.
3. Disconnect the brake caliper.

NOTE: Do not allow the caliper hang from the brake hose. Support it by the mounting bracket.

4. Remove the disc pads from the caliper. Disconnect the anti rattle springs.

5. Connect the anti rattle springs and install the brake pads on to caliper assembly.

6. Connect the brake caliper and install the front wheels.

7. Lower the vehicle. Connect the negative battery cable.

Brake Rotor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Raise and safely support the vehicle. Remove the wheel assembly.

3. Remove the brake caliper mounting bracket, with the caliper and the brake line attached, move it out of the way and support it.

NOTE: Do not allow the caliper hang from the brake hose. Support it by the mounting bracket.

4. Install 2 bolts into the threaded holes in the brake rotor and tighten them evenly. This will remove the rotor from the hub assembly.

5. Install the new brake rotor on the hub.

6. The remainder of the installation is the reverse of the removal procedure.

Brake Drums

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and safely support the vehicle.

2. Make sure that the parking brake is released.

3. Remove the wheels and the rear drum nuts from the vehicle.

4. Remove the brake drum, using a suitable slide hammer.

5. Install the brake drum, tighten the brake drum nuts to 58 ft. lbs.

6. The remainder of the installation is the reverse of the removal procedure.

Brake Shoes

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and safely support the vehicle.

2. Remove the rear wheels from the vehicle. Remove the rear brake drums.

Exploded view of the rear brake drum assembly

3. Remove the brake shoe holddown springs.

4. Disconnect the parking brake cable from the parking brake shoe lever and remove the brake shoes.

5. The installation is the reverse of the removal procedure.

Wheel Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and safely support the vehicle.

2. Remove the rear wheels and brake drums from the vehicle.

3. Remove the rear brake shoes and disconnect the brake line from the rear of the wheel cylinder. Plug the brake line.

4. Remove the 2 rear wheel cylinder mounting bolts. Remove the rear wheel cylinder.

5. Install the wheel cylinder and tighten the mounting bolts to 6.0–8.5 ft. lbs.

6. Connect the brake line to the wheel cylinder and install the rear brake shoes.

7. Replace the rear brake drums and the rear wheels.

8. Lower the vehicle. Connect the negative battery cable.

9. Bleed the brake system and check for any leaks when finished.

Parking Brake Cable REMOVAL & INSTALLATION

1. Disconnect the parking brake cable from the parking lever.

2. Raise and safely support the vehicle. Remove the rear wheels and brake drums from the vehicle.

3. Remove the rear brake shoes and disconnect the park brake cable from the park brake shoe lever.

4. Remove the cable from the brake backing plate by squeezing the park brake cable stop ring.

5. Installation is the reverse of the removal procedure.

ADJUSTMENT

1. Adjust the parking brake lever by loosening or tightening the self locking nut at the park brake lever.

2. The proper adjustment is when the park brake lever is within 7-9 notches, when the lever is pulled up at 44 lbs.

3. Check the rear drum for dragging after adjustment.

FRONT SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Support the axle assembly and remove the upper shock absorber mounting nut.

3. Remove the lower shock absorber mounting nut and remove the shock absorber.

4. Installation is the reverse of the removal procedure.

5. Torque the upper mounting nut to 16-25 ft. lbs. and the lower nut to 23-40 ft. lbs.

MacPherson Strut

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Raise and safely support the vehicle. Allow the front suspension to hang free.

3. Remove the front wheel. Disconnect the E-clip mounting the brake hose and remove the brake hose from the strut bracket.

4. Remove the strut bracket to steering knuckle bolts.

5. Lower the vehicle. Remove the strut support nuts, while holding the strut by hand. Remove the strut assembly.

6. Install the strut assembly and tighten the strut support nuts to 18 ft. lbs.

7. Raise and safely support the vehicle.

8. Install the strut bracket to steering knuckle bolts and tighten to 66 ft. lbs.

9. Connect the brake hose to the strut bracket using the E-clip.

10. Replace the front wheels and lower the vehicle.

11. Connect the negative battery cable.

Coil Springs

REMOVAL & INSTALLATION

Sidekick and Tracker

1. Disconnect the negative battery cable.

2. Raise and safely support the vehicle. Allow the front suspension to hang free.

3. Remove the front wheel and the locking hub assembly.

4. Remove the front axle circlip and washer.

5. Remove the brake caliper mounting bracket, with the caliper and the brake line attached, move it out of the way and support it.

6. Remove the brake disc and disconnect the stabilizer link from the control arm.

7. Disconnect the tie rod end and support the lower control arm using a jack.

8. Disconnect the strut bracket and remove the ball joint castle nut.

9. Remove the steering knuckle and the wheel hub assembly while lowering the jack.

10. Remove the coil spring from the vehicle.

11. Installation is the reverse of the removal procedure.

Leaf Springs

REMOVAL & INSTALLATION

Samurai

1. Disconnect the negative battery cable.

2. Raise and safely support the vehicle. Allow the front suspension to hang free.

3. Remove the stabilizer bar pivot bolt.

4. Support the front axle assembly with an adjustable stand.

5. Remove the leaf spring to spring plate mounting U-bolts.

6. Remove the shackle pin and the nut from the front of the leaf spring.

7. Disconnect the leaf spring bolt and remove the leaf spring.

Checking ball joint play

NOTE: Removal of the leaf spring causes the axle housing to hang. Support it with a safety stand to prevent it from damaging the U-joint of the driveshaft.

8. Installation is the reverse of the removal procedure.

9. Torque the leaf spring and the stabilizer nuts and bolts to 51-65 ft. lbs.

Lower Ball Joints

INSPECTION

Sidekick and Tracker

1. Inspect for the smoothness of the rotation.

2. Check the ball stud for damage.

3. Inspect the dust shield for damage.

REMOVAL & INSTALLATION

Sidekick and Tracker

1. Disconnect the negative battery cable. Remove the coil spring from the vehicle.

2. Remove the control arm mounting bolts.

3. Remove the control arm.

4. Disconnect the ball joint from the control arm and remove the ball joint.

5. Install the ball joint to the control arm and tighten the bolts to 63 ft. lbs.

6. Install the control arm to the chassis and tighten the bolts to 74 ft. lbs.

7. Replace the coil spring and connect the negative battery cable.

Lower Control Arms

REMOVAL & INSTALLATION

Sidekick and Tracker

1. Disconnect the negative battery

cable. Remove the coil spring from the vehicle.

2. Remove the control arm mounting bolts.

3. Remove the control arm.

4. Install the control arm to the chassis and tighten the bolts to 74 ft. lbs.

5. Replace the coil spring and connect the negative battery cable.

Stabilizer Bar

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and safely support the vehicle.

2. Disconnect the left and the right stabilizer ball joints from the front control arms on the Sidekick and Tracker.

3. Disconnect the stabilizer bar pivot bolts on the Samurai.

4. Remove the stabilizer bar mounting bushing bracket bolts and nuts.

5. Remove the stabilizer bar.

6. Remove the stabilizer links on the Sidekick and Tracker.

7. Install the new stabilizer bar, using new bushings.

8. The remainder of the installation is the reverse of the removal procedure.

9. Torque the stabilizer bar pivot bolts to 51–65 ft. lbs. and the mounting bracket nuts to 13–20 ft. lbs. (Samurai). Torque the stabilizer link nuts to 21 ft. lbs. and the stabilizer bar bracket bolts and nuts to 37 ft. lbs. (Sidekick and Tracker).

King Pin and Bushings

REMOVAL & INSTALLATION

Samurai

1. Raise and safely support the vehicle.

2. Remove the steering knuckle from the vehicle.

NOTE: When the steering knuckle is pulled, the lower king pin bearing sometimes falls off.

3. Remove the upper and the lower king pins, mark them. Check the number of shims on each side.

4. Install the new king pin bearings in the steering knuckle holding them in with grease.

5. Install the steering knuckle on the axle assembly.

6. Install the new king pins in the steering knuckle, shim them correctly and torque the bolts to 14–21 ft. lbs.

NOTE: The correct procedure for installing the king pins is to check the turning torque of the spindle while pulling it outwards from the tie rod end hole. A spring type gauge is required for this procedure. The correct force should be 2.20–3.96 lbs. of force require to turn the spindle without the oil seal being installed. Use additional shims, if necessary, to correct the turning torque.

7. With the turning torque of the spindle correct and the oil seal installed, the remainder of the installation is the reverse of the removal procedure.

REAR SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Support the rear axle housing.

2. Remove the upper and lower shock absorber mounting bolts.

3. Remove the rear shock absorber.

4. Install the the rear shock absorber.

5. On Sidekick and Tracker, replace the upper mounting bolts and tighten to 21 ft. lbs. Replace the lower mounting bolts and tighten to 63 ft. lbs.

6. On Samurai, tighten the upper and the lower mounting bolts to 25–39 ft. lbs.

Coil Springs

REMOVAL & INSTALLATION

Sidekick and Tracker

1. Raise and safely support the vehicle. Remove the rear wheels.

2. Support the rear axle housing, using a floor jack.

3. Remove the shock absorber lower mounting bolt.

4. Lower the rear axle housing so that the coil spring can be removed.

5. Remove the coil spring from the vehicle.

6. Install the coil spring. The remainder of the installation is the reverse of the removal procedure.

Leaf Springs

REMOVAL & INSTALLATION

Samurai

1. Raise and safely support the vehicle. Remove the rear wheels.

2. Safely, support the rear axle housing separately.

3. Disconnect the rear shocks and the stabilizer bar from the shackle plate under the rear leaf spring.

NOTE: Do not let the rear axle housing hang on the rear brake hoses or lines.

Rear spring components—Samurai

12 SUZUKI/GEO SAMURAI • SIDEKICK • TRACKER

4. Remove the rear axle housing U-bolts nuts and bolts.

5. Raise the axle housing and remove the shackle plate.

6. Support the leaf spring and disconnect the front and the rear leaf spring mounting bolts.

7. Remove the rear leaf spring. Installation is the reverse of the removal procedure.

8. Torque the front leaf spring bolts to 33-50 ft. lbs., the rear leaf spring bolts to 22-39 ft. lbs., the stabilizer bar bolts to 16-25 ft. lbs. and the shock absorber nuts to 25-39 ft. lbs.

⑤ "T" terminal shorted

FIRING ORDERS

NOTE: To avoid confusion, always replace spark plug wires one at a time.

22R, 22R-E, 22R-TE 4Y-E and 4Y-EC engines
Engine firing order: 1-3-4-2
Distributor rotation: clockwise

2F and 3F-E engines
Engine firing order: 1-5-3-6-2-4
Distributor rotation: clockwise

3VZ-E engine
Engine firing order: 1-2-3-4-5-6
Distributor rotation: counterclockwise

ENGINE ELECTRICAL

NOTE: Disconnecting the battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is disconnected.

Distributor

REMOVAL

2F, 3F-E, 22R, 22R-E, 22R-TE and 3VZ-E Engines

1. Disconnect the negative battery cable. Label and disconnect the high tension cables from the spark plugs. Remove the high tension cable from the coil.

2. Remove the primary wire or the electrical connector and the vacuum line, if equipped from the distributor. Remove the distributor cap spring clips or screws, then the cap.

3. Using a piece of chalk, matchmark the rotor-to-distributor housing and the distributor-to-engine block. This will aid in correct positioning of the distributor during installation.

4. Remove the distributor hold-down clamp bolt and the distributor from the engine.

NOTE: It is easier to install the distributor if the engine timing is not disturbed while it is removed.

4Y-EC and 4Y-E Engines

1. Disconnect the negative battery terminal from the battery.

2. Remove the front-right seat from the vehicle.

3. Remove the engine service hole cover.

4. Disconnect the distributor vacuum advance hoses.

5. Disconnect the high tension cables from the spark plugs.

Distributor assembly—22R, 22R-E and 22R-TE engines

6. Using a piece of chalk, matchmark the rotor-to-distributor housing and the distributor housing-to-engine.

7. Remove the distributor-to-engine bolt and the distributor from the engine.

INSTALLATION—TIMING NOT DISTURBED

All Engines

1. Insert the distributor into the engine block by aligning the matchmarks made during removal.

2. Engage the distributor drive with the oil pump drive shaft.

3. Install the distributor hold-down clamp, the cap, the high tension wire, the primary wire or the electrical connector and the vacuum line(s).

4. Install the spark plugs cables.

5. Connect the negative battery cable.

INSTALLATION—TIMING DISTURBED

2F, 3F-E, 22R, 22R-E, 22R-TE and 3VZ-E Engines

If the engine has been cranked, dismantled or the timing otherwise lost, proceed as follows:

1. Determine the Top Dead Center (TDC) of the No. 1 cylinder's compression stroke by removing the spark plug from the No. 1 cylinder and placing a finger or a compression gauge over the spark plug hole.

NOTE: Using a wrench, turn the crankshaft until the compression pressure starts to build up. Continue cranking the engine until the timing marks indicate TDC (0 degrees).

2. Turn the crankshaft to align the timing marks on the 22R-E and 22R-TE engines to 5 degrees BTDC or on the 22R and 3VZ-E engines to 0 degree TDC.

3. Temporarily install the rotor on the distributor shaft so that the rotor is pointing toward the No. 1 terminal of the distributor cap.

4. Using a small prybar, align the slot on the distributor drive (oil pump driveshaft) with the key on the bottom of the distributor shaft.

5. Install the distributor in the block by rotating it slightly (no more than a gear tooth in either direction) until the driven gear meshes with the drive.

NOTE: Oil the distributor drive gear and the oil pump driveshaft end before installation.

6. Temporarily tighten the lock bolt.

7. Remove the rotor, then install the dust cover, the rotor and the distributor cap.

8. Install the primary wire or the electrical connector and the vacuum line(s).

9. Install the No. 1 cylinder spark plug. Connect the cables to the spark plugs in the proper order. Install the high tension wire on the coil.

10. Start the engine and adjust the ignition timing.

4Y-E and 4Y-EC Engines

1. Remove the No. 1 spark plug, place a finger over the opening and rotate the crankshaft, using a turning tool, in the clockwise direction, until pressure is felt, then replace the spark plug.

NOTE: Make sure that the notch on the crankshaft pulley is aligned with the 0 degree mark on the timing plate.

2. Position the oil pump drive rotor slot 30 degrees from the centerline.

3. On the distributor, align the groove on the housing with the pin of the driven gear (the drill mark side).

4. Insert the distributor by aligning the flange center with the bolt hole in the engine block.

5. Lightly tighten the hold-down bolt.

6. To complete the installation, reverse the removal procedures. Adjust the ignition timing.

Ignition Timing

ADJUSTMENT

NOTE: The timing mark locations differ between the engines used in the Pick-Up and the 4Runner (22R, 22R-E, 22R-TE and 3VZ-E), the Van (4Y-E, 4Y-EC) and the Land Cruiser (2F and 3F-E). On the 22R, 22R-E, 22R-TE, 4Y-EC, 4Y-E and 3VZ-E engines, the timing marks are located on the crankshaft pulley (painted notch) and the timing cover (plate). On the 2F and 3F-E the timing marks are located on the flywheel (ball) and the bellhousing (pointer).

1. Set the parking brake and block the wheels.

2. Clean off the timing marks and mark them with chalk or paint. The crankshaft may have to be rotated to find the marks.

3. Warm the engine to operating temperatures. Connect a tachometer

Timing mark location—4Y-E and 4Y-EC engines

Timing mark location—22R, 22R-E and 22R-TE engines

Timing mark location—3VZ-E engine

to the engine, then, check and/or adjust the engine idle speed.

NOTE: On the 22R, 22R-E, 22R-TE and 3VZ-E engines, connect the positive (+) tachometer terminal either to the negative (-) ignition coil terminal or to the yellow service connector. On the 4Y-EC and 4Y-E engines, connect the positive (+) tachometer to the service connector on the ignition coil/igniter assembly. DO NOT connect it to the distributor side. Improper connections will damage the transistorized igniter. On the 4Y-E, 4Y-EC and 3VZ-E engines, use a service wire to short the engine check connector

4. Turn off the engine and connect a timing light according to the manufacturer's directions.

5. On the 22R-E and 22R-TE engine, disconnect and short the T and the E₁ connector of the engine check harness (near the front of the vehicle). On all other engines, disconnect and plug the vacuum hose(s) from the distributor vacuum unit.

Typical combination switch assembly

NOTE: If equipped with a High Altitude Compensation (HAC) system there are 2 vacuum hoses which connect to the distributor. Both must be disconnected and plugged. These systems require an extra step in the timing procedure.

6. Be sure that the timing light wires are clear of the fan and pulleys, then start the engine.

7. Allow the engine to run at the specified idle speed with the shift selector in neutral for manual transmission equipped vehicles or **D** for automatic transmission equipped vehicles.

8. Point the timing light at the marks. With the engine at the specified idle, the marks should align.

9. If the timing is incorrect, loosen the bolt at the base of the distributor just enough so that the distributor can be turned. Hold the distributor by its base and turn it slightly to advance or retard the timing as required. Once the marks are seen to align properly, tighten the bolt.

10. After tightening the distributor bolt or adjusting the octane selector, recheck the timing. Turn off the engine, then, disconnect the timing light and connect the vacuum line(s) at the distributor or the electrical T and E₁ connector, except on engines with HAC.

11. On engines with HAC after setting the initial timing, reconnect the vacuum hoses at the distributor. Recheck the timing.

12. If the advance is still low, pinch the hose between the HAC valve and

the 3 way connector; it should now be to specifications. If not, the HAC valve should be checked for proper operation.

Alternator

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

BELT TENSION ADJUSTMENT

Inspection and adjustment to the alternator drive belt should be performed every 30,000 miles or if the alternator has been removed.

1. Inspect the drive belt to see that it is not cracked or worn. Be sure that its surfaces are free of grease or oil.

2. If not using a belt tension gauge, push down on the belt halfway between the fan and the alternator pulleys, (or crankshaft pulley) with thumb pressure; belt deflection should be $\frac{3}{8}$ – $\frac{1}{2}$ in.

3. If using the an appropriate belt tension gauge, position it in the middle of the drive belt and check the belt tension; a new belt should be 170–180 lbs. (Van) or 100–150 lbs. (Pick-Up and 4Runner), a used belt should be 95–135 lbs. (Van) or 60–100 lbs. (Pick-Up and 4Runner).

4. If the belt tension requires adjustment, loosen the adjusting link bolt and move the alternator until the proper belt tension is obtained.

5. Tighten the adjusting link bolt.

REMOVAL & INSTALLATION

NOTE: On some engines the alternator is mounted very low. On these engines it may be necessary to remove the gravel shield and work from underneath the vehicle in order to gain access to the alternator.

1. Disconnect the negative battery cable.

2. Remove the air cleaner, if necessary, to gain access to the alternator.

3. On the 22R remove the vane pump pulley.

4. On the 22R-E and 22R-TE engines, drain the engine coolant. If necessary, remove the under engine cover.

5. If equipped with power steering, remove the water inlet pipe bolts and the water inlet hose from the engine.

NOTE: If equipped with air conditioning, it may be necessary to remove the No. 2 fan shroud.

6. Remove the nut or the wiring connector and the wire(s) from the alternator.

7. Remove the adjusting lock, the pivot and the adjusting bolt(s), then the drive belt from the alternator.

8. Remove the alternator attaching bolt and then withdraw the alternator from its bracket.

9. To install, reverse the removal procedures. Rotate the drive belt 8 revolutions (new belt) or 5 revolutions (used belt). Adjust the drive belt tension.

10. Refill the cooling system, if it was drained.

11. Connect the negative battery cable.

Starter

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

REMOVAL & INSTALLATION

1. If necessary, raise and support the vehicle safely.

2. Disconnect the negative battery terminal from the battery.

NOTE: On some 22R, 22R-E and 22R-TE engines, equipped with an automatic transmission, it may be necessary to remove the transmission oil filler tube.

3. Disconnect the wiring connectors and the wiring from the starter.

4. Remove the starter-to-engine bolts and the starter from the engine.

5. To install, reverse the removal procedures.

CHASSIS ELECTRICAL

Heater Blower Motor

REMOVAL & INSTALLATION

Pick-Up, Van and 4Runner

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector from motor.
3. Remove the blower motor-to-case screws and lift the motor from the case.
4. To install, reverse the removal procedures. Make sure that the seal around the motor flange is in good condition.

Land Cruiser

1. Disconnect the negative battery cable. Disconnect the electrical connector from the blower motor.
2. Disconnect the flexible tube from the side of the blower motor.
3. Remove the blower motor fasteners and lower the blower motor out of the air inlet duct.
4. To install, reverse the removal procedures. During installation, be sure to position the motor so that the flexible tube can be attached to the motor.

Windshield Wiper Motor

REMOVAL & INSTALLATION

Pick-Up, Van and 4Runner

FRONT

1. Disconnect the negative battery cable. Disconnect the wiring from the wiper motor. Remove the motor from the fire wall.
2. Remove the nut, then, pry the wiper link from the crank arm.
3. Remove the motor.
4. To install, reverse the removal procedures and inspect the operation.

REAR

1. Disconnect the negative battery cable. At the rear of the vehicle, remove the wiper motor cover panel.
2. Remove the wiper arm from the wiper motor.
3. Disconnect the electrical connector from the wiper motor.
4. Remove the wiper motor-to-door bolts and the motor from the vehicle.
5. To install, reverse the removal procedures and inspect the operation.

Land Cruiser

NOTE: On these vehicles, the wiper motor is removed with the linkage assembly.

1. Disconnect the negative battery cable. Remove the wiper arm retaining nuts, then, the wiper arm/blade assemblies.
2. Remove both wiper arm pivot covers and the pivot-to-cowl attaching screws.
3. Remove the service hole covers from the cowl area of the engine compartment.
4. Disconnect the wiring from the wiper motor.
5. From the engine compartment, remove the wiper motor plate-to-cowl screws. Withdraw the wiper motor and the linkage from the cowl panel as an assembly.
6. Pry the linkage from of the wiper motor.
7. To install, reverse the removal procedures.

Windshield Wiper Linkage

REMOVAL & INSTALLATION

Pick-Up, Van and 4Runner

1. Disconnect the negative battery cable. Remove the wiper motor.
2. Remove the wiper arms by removing their retaining nuts and working them off their shafts.
3. Remove the wiper shafts nuts/spacers and push the shafts down into the body cavity. Pull the linkage out of the cavity through the wiper motor hole.
4. To install, reverse the removal procedures.

Land Cruiser

1. Disconnect the negative battery cable. Remove the wiper arm assemblies.
2. Remove the end plate from the pivot housing.
3. Remove the wiper motor with the linkage cable.
4. Separate the wiper motor and the transmission.
5. Remove the linkage cable.
6. To install, reverse the removal procedures.

Windshield Wiper Switch

REMOVAL & INSTALLATION

Front

1. Disconnect negative battery terminal from the battery.

2. Remove the upper and the lower steering column shrouds.

3. Disconnect the combination switch electrical connector.

4. Remove the terminal from the horn contact.

5. To remove the windshield/wiper switch wires from the electrical connector, place a small prybar into the end of the connector, pry up on the retaining tab and pull the wire(s) from the connector.

6. Remove the windshield/wiper switch-to-combination switch screw and the switch.

7. Installation is the reverse of the removal procedure. To install, place the wire(s) into the electrical connector's slots, place a suitable tool behind the wire terminal and push the wire into the connector until the retaining tab locks it into place.

Rear

If equipped with a rear wiper switch, it will be located in the center of the dash.

1. Disconnect the negative battery cable. Using a small pry bar, pry the rear wiper switch from the center of the dash.

2. Disconnect the electrical connector from the rear of the switch.

3. To install, reverse the removal procedures.

Instrument Cluster

REMOVAL & INSTALLATION

Pick-Up, Van and 4Runner

1. Disconnect the negative battery terminal from the battery.
2. Remove the upper and lower steering column covers.
3. Remove the instrument trim panel screws and the panel.
4. Disconnect the speedometer cable from the speedometer.
5. Remove the instrument panel screws and pull the panel forward. Disconnect the electrical connectors from the back of the panel and remove the panel.
6. To install, reverse the removal procedures.

Land Cruiser

1. Disconnect the negative battery terminal from the battery.
2. Disconnect the speedometer cable. Remove the instrument panel screws.
3. Loosen the steering column clamp by removing the attaching bolts.
4. Pull out the instrument panel and the speedometer, disconnect the electrical connectors and remove the panel.

Typical instrument cluster and panel assembly—Pick-Up and 4Runner

5. To install, reverse the removal procedures.

Speedometer

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the instrument cluster and disconnect the cable from the speedometer.

2. Disconnect the other end of the speedometer cable from the transmission extension housing and pull the cable from its jacket at the transmission end.

NOTE: If the cable is being replaced because it is broken, be sure to remove both pieces of the broken cable.

3. Using graphite, lubricate the new speedometer cable and insert it into the cable jacket at the lower end.

4. Connect the speedometer cable to

the transmission, then, to the instrument cluster.

5. To complete the installation, reverse the removal procedures.

Radio

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the screws retaining the lower center finish panel to the dash board.

3. Remove the radio retaining screws.

4. Remove the radio by pulling it out of the instrument panel.

5. Disconnect the antenna wire and the multi-plug connector.

6. Remove it from the vehicle.

7. Installation is the reverse of the removal procedure.

Headlight Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery terminal from the battery.

2. Remove the upper and lower steering column covers.

3. Disconnect the electrical connector from the combination switch.

4. Remove the headlight switch-to-combination switch screws and the headlight switch from the combination switch.

5. To install, reverse the removal procedures.

Turn Signal Switch

REMOVAL & INSTALLATION

1. Disconnect negative battery terminal from the battery.

2. Remove the upper and the lower steering column shrouds.

3. Disconnect the combination switch electrical connector.

4. At the left-rear of the combination switch, remove the mounting screws and the turn signal switch.

5. If necessary to remove the turn signal switch wires from the electrical connector, place a small prybar into the end of the connector, pry up on the retaining tab and pull the wire(s) from the connector.

6. To install, place the wire(s) into the electrical connector's slots, place a prybar behind the wire terminal and push the wire into the connector until the retaining tab locks it into place.

7. To complete the installation, reverse the removal procedures.

Combination Switch

REMOVAL & INSTALLATION

The combination switch is composed of the turn signal, the headlight control, the dimmer, the hazard, the wiper and the washer switches.

1. Disconnect the negative battery cable. Remove the steering wheel.

2. Remove the upper and lower steering column shroud screws and the shrouds.

3. Remove the combination switch screws and the switch from the column.

4. Disconnect the electrical connector from the combination switch. To remove the wires from the electrical connector, perform the following procedures.

a. Using a small prybar, insert it into the open end between the locking lugs and the terminal.

b. Pry the locking lugs upward

and pull the terminal out from the rear.

c. To install the terminals, simply push them into the connector until they lock securely in place.

5. To complete the installation, reverse the removal procedures.

Ignition Lock/Switch

REMOVAL & INSTALLATION

The ignition lock/switch is located behind the combination switch on the steering column.

1. Disconnect the negative battery terminal from the battery.

2. Remove the upper and lower steering column covers.

3. Disconnect the ignition switch from the electrical connector.

4. Using the key in the ignition switch, turn it to the ACC position.

5. Using a thin rod, place it into the hole of the cylinder lock housing. Pushing down on the thin rod, pull out the cylinder lock.

6. Remove the unlock warning switch-to-combination switch screws and the unlock warning switch.

7. Remove the ignition switch-to-combination switch screw and the ignition switch.

8. To install, push the ignition switch into the housing and install the screw. Using the key, install cylinder lock into the housing until the retaining tab locks it in place.

9. To complete the installation, reverse the removal procedures.

Stoplight Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the electrical connector from the switch.

3. Remove the mounting nut and remove the switch from the bracket.

4. Installation is the reverse of the removal procedure.

Fuses and Circuit Breakers

LOCATION

There are 3 fuse boxes in the Pick-Up, 4Runner and Land Cruiser. One is located in the engine compartment, 1 at the drivers side kick panel and 1 behind the glove box. The Van has a combination fuse box and relay panel, located behind a panel on the passengers side of the instrument panel.

Each fuse box has the fuse numbers and circuits protected on the lid of the box.

ENGINE COOLING

Radiator

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Drain the cooling system.

2. Unfasten the hose clamps and disconnect the hoses from the radiator. On Land Cruiser vehicles equipped with air conditioning, properly discharge the system.

3. Disconnect the transmission cooling lines on vehicles equipped with an automatic transmission.

4. On the 22R-TE engine, disconnect the No. 1 turbocharger cooling line.

5. Remove the fan shrouds, if so equipped.

6. Remove the grille assembly and remove the hood lock from the radiator support. On Land Cruiser vehicles with air conditioning, remove the condenser to radiator bolts.

7. Remove the coolant recovery tank. Unbolt the radiator and remove it from the vehicle.

To install:

8. Install the radiator into position.

9. On Land Cruiser vehicles with air conditioning, install the condensor-to-radiator bolts.

10. Install the hood lock assembly and install the grille.

11. Connect the radiator hoses and the transmission cooler lines.

12. On the 22R-TE engine, connect the turbocharger water line.

13. Install the coolant recovery bottle. Refill the cooling system to the correct level.

14. Run the engine and check for leaks.

Heater Core

REMOVAL & INSTALLATION

NOTE: On vehicles equipped with air conditioning, the heater and the air conditioner are completely separate units. Be certain when working under the dashboard that only the heater hoses are disconnected.

CAUTION

The air conditioning hoses are under pressure; if disconnected, the escaping refrigerant will freeze any surface with which it comes in contact, including skin and eyes.

Pick-Up, Van and 4Runner

1. Disconnect the negative battery terminal from the battery.

2. Drain the cooling system.

3. Remove the glove box, the defroster hoses, the air damper, the air duct and the 2 side defroster ducts.

4. Remove the control unit from the instrument panel.

5. Disconnect the heater hoses from the core tubes.

6. Remove the retaining bolts and lift out the heater unit. At this point, the core may be pulled from the case.

7. To install, reverse the removal procedures. Refill the cooling system.

Land Cruiser

FRONT HEATER

NOTE: The entire heater unit must be removed to gain access to the heater core. This procedure requires almost complete disassembly of the instrument panel and lowering of the steering column.

1. Disconnect the negative battery terminal from the battery. Remove the glove box and the glove box door.

2. Remove the lower heater ducts. Remove the large heater duct from the passenger side of the heater unit.

3. Remove the ductwork from behind the instrument panel. Remove the radio.

4. Disconnect the wiring connector from the right-side inner portion of the glove opening.

5. Remove the instrument panel pad. Remove the hood release lever. Disconnect the hand throttle control cable.

6. Remove the retaining screw from the left-side of the fuse block.

7. Remove the steering column-to-instrument panel attaching nuts and carefully lower the steering column. Tag and disconnect the wiring as necessary in order to lower the column assembly.

8. Disconnect the electrical connector from the rheostat located to the left of the steering column opening.

9. Remove the center dual outlet duct which is attached to the upper portion of the heater unit.

10. Remove the lower instrument panel.

11. Tag and disconnect the hoses from the heater unit. Remove the heater unit-to-firewall fasteners and the heater unit.

12. Remove the heater core-to-heater unit pipe clamps and the heater core retaining clamp, then, withdraw the heater core from the heater unit.

13. To install, reverse the removal procedures. Torque the steering column-to-instrument panel fasteners to 14–15 ft. lbs. Refill the cooling system.

REAR HEATER

1. Turn off the water valve and disconnect both hoses from the rear heater core.

2. Disconnect the wiring from the rear heater.

3. Remove the mounting bolts and lift out the core.

4. To install, reverse the removal procedures. Refill the cooling system.

Water Pump

REMOVAL & INSTALLATION

22R, 22R-E and 22R-TE Engines

1. Disconnect the negative battery cable. Drain the cooling system.

2. If equipped, remove the fan shroud bolts and the shroud.

3. Loosen the alternator adjusting link bolt and remove the drive belt, then, swing the alternator toward the engine.

4. If equipped with an air pump, air conditioning compressor or power steering pump drive belts, it may be necessary to loosen the adjusting bolt, remove the drive belt(s) and move the component(s) out of the way.

5. Remove the fan from the fluid coupling, the fluid coupling and pulley from the water pump, then, the water pump-to-engine bolts and the pump.

6. Clean the gasket mounting surfaces.

7. To install, use a new gasket, sealant and reverse the removal procedures. Adjust the drive belt(s) tension. Refill the cooling system.

4Y-E and 4Y-EC Engines

1. Disconnect the negative battery cable. Drain the cooling system. Disconnect the drive belt from the water pump.

2. Remove the fan from the fluid

coupling and the fluid coupling/pulley from the water pump.

3. Remove the drive belt adjusting bar (from the water pump), the water pump-to-engine bolts and the water pump.

4. Clean the gasket mounting surfaces.

5. To install, use a new gasket, sealant and reverse the removal procedures.

6. Torque the water pump nuts/bolts to 13 ft. lbs., the drive belt adjusting bar to 29 ft. lbs., the pulley/fluid coupling-to-water pump nuts to 10 ft. lbs. and the fan-to-fluid coupling nuts to 10 ft. lbs. Adjust the drive belt tension. Refill the cooling system.

2F and 3F-E Engines

1. Disconnect the negative battery cable.

2. Drain the engine coolant.

3. Remove the accessory drive belt. Loosen the power steering pump mount, idler pulley and adjusting bolts.

4. Disconnect the overflow tank hose.

5. Disconnect the radiator inlet hose and remove the fan shroud.

6. Remove the fan, fluid coupling and the water pump pulley.

7. Remove the alternator. Disconnect the hoses from the water pump.

8. Remove the water pump, power steering idler pulley and bracket as an assembly.

9. Installation is the reverse of the removal procedure. Torque the water pump mounting bolts to 27 ft. lbs. (37 Nm).

3VZ-E Engine

1. Disconnect the negative battery cable.

2. Remove the timing belt assembly.

3. Remove the thermostat.

4. Remove the idler pulley.

5. Remove the water pump mounting bolts and remove the water pump.

To install:

6. Clean the mounting surface.

7. Use new seal packing on the water pump and install it in position on the engine.

Typical heater unit and ducts — Land Cruiser

8. Torque the bolts marked A to 13 ft. lbs. (18 Nm) and the bolts marked B to 14 ft. lbs. (20 Nm).

9. Install the thermostat and the idler pulley.

10. Install the timing belt assembly.

11. Connect the negative battery cable and refill the cooling system.

Thermostat

REMOVAL & INSTALLATION

22R, 22R-E and 22R-TE Engines

1. Disconnect the negative battery cable. Partially drain the cooling system to a level below the thermostat.

NOTE: Unless the upper radiator hose is positioned over one of the thermostat housing (water outlet) bolts, it is not necessary to detach the hose.

2. Remove the mounting bolts, the water outlet and the thermostat from the intake manifold.

3. Clean the gasket mounting surfaces.

4. To install, use a new gasket, sealant and reverse the removal procedures. Refill the cooling system.

NOTE: When installing a new thermostat, be sure that the thermostat is positioned with the spring down.

5. Bleed the cooling system.

4Y-E and 4Y-EC Engines

1. Disconnect the negative battery cable. Drain the cooling system to a level below the thermostat.

2. Disconnect the radiator outlet hose from the thermostat housing.

3. Remove the mounting bolts, the thermostat housing and the thermostat.

4. Clean the gasket mounting surfaces.

5. To install, use a new gasket, sealant and reverse the removal procedures, making sure that the jiggle valve is placed at the upper-left position. Torque the thermostat housing to 9 ft. lbs. Refill the cooling system.

NOTE: When installing a new thermostat, be sure that the thermostat is positioned with the spring facing the engine block.

6. Bleed the cooling system.

2F and 3F-E Engines

1. Disconnect the negative battery cable.

2. Drain the cooling system.

Water pump assembly—2F and 3F-E engines

Water pump assembly—3VZ-E engine

3. Disconnect the cold start injector wire and the BVS vacuum lines.

4. Remove the thermostat housing bolts and remove the housing.

5. Remove the thermostat housing.

6. Installation is the reverse of removal. Torque the housing bolts to 13 ft. lbs. (18 Nm).

7. Refill the cooling system. Bleed the cooling system.

3VZ-E Engine

1. Disconnect the negative battery cable.

2. Drain the coolant.

3. Remove the radiator outlet hose from the housing.

4. Remove the thermostat housing and thermostat from the engine.

5. Installation is the reverse of the

removal procedure. Use a new gasket for installation.

6. Torque the housing bolts to 14 ft. lbs. (20 Nm). Refill and bleed the cooling system.

COOLING SYSTEM BLEEDING

After working on the cooling system, even to replace the thermostat, it must be bled. Air trapped in the system will prevent proper filling and leave the radiator coolant level low, causing a risk of overheating.

1. To bleed the system, start with the system cool, the radiator cap off and the radiator filled to about an inch below the filler neck.

2. Start the engine and run it at

Water pump mounting bolt locations—3VZ-E engine

slightly above normal idle speed. This will insure adequate circulation. If air bubbles appear and the coolant level drops, fill the system with an anti-freeze/water mixture to bring the level back to the proper level.

3. Run the engine this way until the thermostat opens. When this happens, coolant will move abruptly across the top of the radiator and the temperature of the radiator will suddenly rise.

4. At this point, air is often expelled and the level may drop quite a bit. Keep refilling the system until the level is near the top of the radiator and remains constant.

5. If the vehicle has an overflow tank, fill the radiator right up to the filler neck. Replace the radiator filler cap.

FUEL SYSTEM

Fuel System Service Precaution

When working with the fuel system certain precautions should be taken; always work in a well ventilated area, keep a dry chemical (Class B) fire extinguisher near the work area. Always disconnect the negative battery cable and do not make any repairs to the fuel system until all the necessary steps for repair have been reviewed.

RELIEVING FUEL SYSTEM PRESSURE

1. Disconnect the negative battery terminal from the battery.

2. Allow the system enough time to bleed off the fuel pressure through the fuel return line.

3. Before disconnecting any fuel line component, place a rag under the item to catch any excess fuel.

4. After installation, install the negative battery terminal, turn ON the ignition switch and check for fuel leaks.

Fuel Filter

REMOVAL & INSTALLATION

Except 22R Engine

The fuel filter is located in the engine compartment, at the inlet line to the fuel rail.

1. Disconnect the negative battery cable.
2. Relieve the fuel system pressure.
3. Disconnect and plug the inlet and outlet lines from the filter.
4. Remove the filter retaining bolts and remove the filter.
5. Installation is the reverse of the removal procedure.
6. Use new O-rings and tighten the lines to 22 ft. lbs. (29 Nm).
7. Connect the negative battery cable. Run the engine and check for leaks.

22R Engine

The fuel filter is located under the rear of the vehicle, next to the fuel tank.

1. Disconnect the negative battery cable.
2. Raise and safely support the vehicle.
3. Remove the protective cover from the filter.
4. Disconnect and plug the inlet and outlet lines from the filter.
5. Remove the filter retaining bolts and remove the filter.
6. Installation is the reverse of the removal procedure.
7. Use new O-rings and tighten the lines to 22 ft. lbs. (29 Nm).
8. Connect the negative battery cable. Run the engine and check for leaks.

Mechanical Fuel Pump

PRESSURE TESTING

1. Attach a pressure gauge to the pressure side of the fuel line. On vehicles equipped with a vapor return system, squeeze off the return hose.
2. Run the engine at idle and note the reading on the gauge. Stop the engine and compare the reading with the specification. If the pump is operating properly, the pressure will be as specified and will be constant at idle speed. If the pressure varies or is too high or low, the pump should be repaired or replaced.
3. Remove the pressure gauge.

FLOW TEST

1. Disconnect the fuel line from the carburetor. Run the fuel line into a suitable measuring container.

2. Run the engine at idle until there is one pint of fuel in the container. One pint should be pumped in 30 seconds or less.

3. If the flow is below minimum, check for a restriction in the line.

REMOVAL & INSTALLATION

22R Engines

1. Disconnect the negative battery terminal from the battery.
2. Drain the cooling system to a level below the upper radiator hose and remove the upper radiator hose.
3. Remove all 3 lines from the fuel pump, the mounting bolts, the fuel pump and the gasket.

NOTE: The fuel pump is not repairable. It must be replaced as a complete unit.

4. Clean the gasket mounting surfaces.
5. To install, use a new gaskets and reverse the removal procedures. Refill the cooling system. Start the engine and check for leaks.

2F Engine

1. Disconnect the negative battery terminal from the battery.
2. Remove and plug the fuel lines at fuel pump. Remove the fuel pump-to-engine bolts and the pump.
3. Clean the gasket mounting surfaces.
4. To install, use a new gasket and reverse the removal procedures. Start the engine and check for fuel leaks.

Typical electric fuel pump

Typical mechanical fuel pump

Electric Fuel Pump

An electric fuel pump is used on all fuel injected engines. The fuel pump is wired into the ignition switch and oil pressure switch circuits. In the event of an oil pressure loss, the fuel pump is turned **OFF** so that the engine will stall, thus preventing engine damage due to the oil pressure loss. The fuel pump will operate only when the ignition switch is turned to the **START** position and when the oil pressure is normal.

OPERATION TESTING

1. Disconnect the electrical clip from the oil pressure switch.
2. Turn the ignition switch to the **ON** position (do not start the engine).
3. Short the **Fp** and the **+B** terminals of the check connector. Check the cold start injector hose for pressure.
4. Check for a smooth flow of gasoline from the fuel filter outlet. If the pump is noisy, it is probably defective. If the pump does not run, check the pump resistor and relay.
5. Disconnect the jumper wire and reconnect the check connector. Turn the ignition switch **OFF**.

PRESSURE TESTING

1. Disconnect the negative battery terminal from the battery and the wiring connector from the cold start injector.
2. Place a container or a shop towel near the end of the delivery tube.
3. Slowly loosen the cold start injector union bolt, then, remove the bolt and the gaskets. Drain the fuel line.
4. Using pressure gauge tool No. 09268-45011 or equivalent, connect it in line with the cold start injector. Reconnect the battery cable.
5. Short the **Fp** and **+B** terminals of the check connector wire. Turn the ignition switch to the **ON** position and measure to fuel pump pressure. It should be 33-38 psi. Turn the ignition switch **OFF**.

NOTE: If the pressure is high, replace the pressure regulator; if the pressure is low, check the hoses, the connections, the fuel pump, the fuel filter or the pressure regulator.

6. Remove the jumper wire from the check connector. Start the engine. Disconnect and plug the vacuum sensing hose at the pressure regulator, then, measure the fuel pressure at idle. It should be 33-38 psi.

7. Reconnect the vacuum sensing hose to the pressure regulator. The

pressure should now be 27-31 psi.; if not, check the vacuum hose and/or the pressure regulator.

8. Stop the engine and check that the fuel pressure remains at 21 psi. for 5 minutes. If not, check the fuel pump, the pressure regulator and/or the injectors.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Drain the fuel tank.
2. Disconnect the electrical connector and the fuel lines from the fuel tank.
3. Remove the inlet tube and mounting bolts/straps, then, the fuel tank from the vehicle.
4. Remove the access plate-to-fuel tank bolts, then, pull out the plate/fuel pump assembly.
5. Disconnect the electrical connectors from the fuel pump. Pull the bracket from the lower-side of the fuel pump, then, remove the fuel pump from the fuel hose.
6. Remove the rubber cushion, the clip and the fuel filter from the bottom of the fuel pump.
7. To install, use new gaskets and reverse the removal procedures. Torque the fuel pump bracket-to-fuel tank to 43 inch lbs. Refill the fuel tank.

Carburetor

REMOVAL & INSTALLATION

1. Disconnect the negative battery terminal from the battery.
2. Label and disconnect the emission control hoses. Disconnect the air intake hose. Remove the mounting and butterfly nuts, then, lift the air cleaner from the carburetor.
3. If equipped with an automatic transmission, disconnect the throttle cable or rod. Disconnect the fuel hose, the emission control hose, the PCV hose and the wiring connector(s) from the carburetor.
4. Disconnect the accelerator linkage and the choke pipe (if equipped).
5. On the 2F engine, disconnect the magnetic valve wire from the coil terminal and the choke cable from the carburetor.
6. Remove the carburetor-to-manifold nuts/bolts and lift it from the manifold.
7. Cover the open manifold with a clean cloth to prevent dirt and small objects from entering into the engine. Clean the gasket mounting surfaces.
8. To install, use a new gasket and reverse the removal procedures. After the engine has been started, check for fuel and vacuum leaks.

Carburetor components—22R, 22R-E and 22R-TE engines

IDLE SPEED AND MIXTURE ADJUSTMENT

2F Engine

NOTE: Idle mixture adjustments cannot be performed; these adjustments are preset at the factory.

The idle speed and mixture should be adjusted under the following conditions: the air cleaner must be installed, the choke fully opened, the transmission should be in **N**, all accessories should be turned **OFF**, all vacuum lines should be connected and the ignition timing should be set to specification.

1. Start the engine and allow it to reach normal operating temperatures.
2. Check the float setting; the fuel level should be just about even with the spot on the sight glass. If the fuel level is too high or low, adjust the float level.

3. Connect a tachometer in accordance with its manufacturer's instructions. However, connect the tachometer positive (+) lead to the coil's (-) negative terminal or to the igniter's service connector (if provided).

NOTE: Do not connect the tachometer to the distributor side; damage to the transistorized ignition could result. Never allow the tachometer terminal to touch ground for damage to the igniter or the ignition coil could result.

4. Remove the caps from the idle mixture screws. Turn the idle speed adjusting screw to obtain the initial idle speed of 690 rpm (manual transmission).

5. Turn the idle mixture adjusting screw to increase the idle speed as much as is possible.

6. Next, turn the idle speed screw to again obtain the same idle speed figure given in Step 4.

7. If possible, turn the idle mixture screw to increase the idle speed again.

8. Repeat Steps 6 and 7 until the idle mixture adjusting screw will no longer increase the idle speed above the figure specified in Step 4.

9. Slowly turn the idle mixture screw clockwise, until the correct idle speed is reached (this makes the mixture leaner).

10. Disconnect the tachometer and install new idle mixture screw caps.

22R Engine

NOTE: The idle mixture screw is preset at the factory and adjustment should not be necessary.

The idle speed should be adjusted under the following conditions: the air cleaner must be installed, the choke fully opened; the transmission should be in N, all accessories should be turned OFF, all vacuum lines should be connected and the ignition timing should be set to specification.

1. Start the engine and allow it to reach normal operating temperatures.

2. Check the float setting; the fuel level should be just about even with the spot on the sight glass. If the fuel level is too high or low, adjust the float level.

NOTE: Do not connect the tachometer to the distributor side; damage to the transistorized ignition could result. Never allow the tachometer terminal to touch ground for damage to the igniter or the ignition coil could result.

3. Connect a tachometer in accordance with its manufacturer's instructions. However, connect the tachometer positive (+) lead to the coil's (-) negative terminal or to the igniter's service connector (if provided).

NOTE: If the idle mixture caps have been removed, turn the idle mixture screws to the fully closed position, then, open them 3 1/2 turns.

4. Using a pair of pliers, remove the caps from the idle speed adjusting screw. Turn the idle speed adjusting screw to obtain the correct idle speed: 700 rpm (if equipped with a manual transmission) or 750 rpm (if equipped with an automatic transmission).

5. Disconnect the tachometer and install new idle speed adjusting screw cap.

FLOAT LEVEL ADJUSTMENT

22R Engine

For this procedure, the air horn must be removed from the carburetor and the gasket removed from the air horn.

1. Position the air horn with the floats facing upward; allow the float to rest by itself.

2. Using tool No. SST 09240-00014 or equivalent, position it between the floats and the air horn; the measure-

ment should be 0.386 in. If adjustment is necessary, bend the tang at the float pivot point.

3. Using a vernier caliper, raise the float and measure the distance between the bottom of the float and the air horn; the distance should be 1.89 in. If adjustment is necessary, bend the tang at the pivot point.

4. After adjustment, replace the air horn onto the carburetor.

2F Engine

1. Remove the air horn from the carburetor. Invert the air horn and allow the float to hang towards the air horn.

2. With the air horn gasket removed, measure the distance between the float and the air horn, at the end of the float opposite the needle valve. The distance should be 0.295 in. If adjustment is necessary, remove the float and bend the tab which is centered between the hinge pivot points. After the adjustment is completed, reinstall the float and recheck the setting.

3. Lift upwards on the float and measure the distance between the needle valve push pin and the lip of the float. The distance should be 0.043 in. If adjustment is necessary, remove the float and bend the tabs located just inside of the hinge points. After the adjustment is completed, reinstall the float and recheck the setting.

SERVICE ADJUSTMENTS

For all carburetor service adjustment procedures and specifications, please refer to "Carburetor Service" in the Unit Repair section.

Fuel Injection

IDLE SPEED ADJUSTMENT

The 22R-E, 22R-TE, 3F-E, 4Y-E, 4Y-EC and 3VZ-E engines are equipped with a computer activated, electronic fuel injection system. Prior to adjusting the idle speed, make sure that the air cleaner is installed. All vacuum hoses are connected. All pipes and hoses in the air intake system are connected and in good condition. All fuel injection system wiring is connected and in good condition. The engine is at normal operating temperature. All accessories are OFF. Transmission selector lever in N.

1. Connect the tachometer positive (+) lead to the coil's (-) negative terminal or to the igniter's service connector (if provided).

2. Run the engine at 2500 rpm for 2 minutes.

22R-E Engine

3VZ-E Engine

Idle speed adjustment screw location

3. Run the engine at idle and turn the idle speed adjusting screw to obtain the correct idle speed.

4. Disconnect and remove the tachometer.

Cold Start Injector

The EFI engines have a cold start injector located in the intake air chamber which aids in cold weather starting.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable and the cold start injector wire.

2. Place a shop towel or a container under the fuel delivery pipe and drain the fuel from the pipe.

3. Disconnect the fuel pipe from the cold start injector.

4. Remove the mounting bolts and the cold start injector from the intake air chamber.

5. To install, use new gaskets and reverse the removal procedures. Torque the injector bolts to 44-60 inch lbs.

Fuel Pressure Regulator

The fuel pressure regulator is located on the fuel delivery pipe of the fuel system, it maintains a constant fuel pressure in the injection system.

REMOVAL & INSTALLATION

1. Disconnect the vacuum sensing hose from the pressure regulator.

NOTE: On the 22R-E and the 22R-TE engines, remove the No. 1 EGR pipe.

2. Place a shop towel or a container under the fuel hose connection and

disconnect the fuel return hose from the regulator.

3. Remove the locknut (22R-E, 22R-TE and 3F-E) or the mounting bolts (4Y-E, 4Y-EC and 3VZ-E) and the pressure regulator from the fuel delivery pipe.

4. To install, reverse of removal. Torque the locknut to 22 ft. lbs. (22R-E, 22R-TE and 3F-E) or bolts to 44-60 inch lbs. (4Y-E, 4Y-EC and 3VZ-E). Start the engine and check for fuel leaks.

Fuel Injector

TESTING

Each injector may be tested for operation while on the engine, in 2 ways.

1. Listen for a clicking at the injector.

2. Using an ohmmeter, check the continuity at each injector's terminal; the resistance should be 1.5-3.0 ohms.

REMOVAL & INSTALLATION

1. Disconnect the negative battery terminal from the battery and the ground strap from the rear side of the engine.

2. Disconnect the accelerator wire. If equipped with an automatic transmission, disconnect the throttle cable from the bracket and the clamp.

3. Disconnect the No. 1 and No. 2 PCV hoses.

4. If equipped with a 22R-TE engine, disconnect the No. 2 PCV hose and the Vacuum Control Valve (VCV).

5. Disconnect the following items:

- a. Brake power booster hose
- b. Air control valve hoses
- c. Vacuum Switching Valve (VSV)

d. Evaporative emission control hose

e. EGR vacuum hose and modulator

f. Pressure regulator hose (2WD)

g. Fuel pressure-up (VSV) and hose

h. No. 1 and No. 2 air valve hose from the throttle body

i. No. 2 and No. 3 water bypass hoses from the throttle body

j. Cold start injector wire

k. Throttle position wire

6. Remove the following items:

a. Cold start injector-to-plenum chamber bolt.

b. No. 1 EGR pipe-to-plenum chamber bolts.

c. Manifold stay-to-plenum chamber bolts.

d. Fuel hose clamp, 4 bolts, 2 nuts and the bond strap.

e. The plenum chamber with the throttle body and gaskets.

Removing the fuel delivery pipe

Injector installation into delivery pipe

7. Disconnect the fuel return hose.

8. Disconnect the following wires:

- a. Auxiliary air valve wire
- b. Knock sensor wire
- c. Oil pressure sender gauge/switch

d. Starter wire (terminal 50)

e. Transmission wires

f. Air conditioning compressor wires

g. Injector wires

h. Water temperature sender gauge wire

i. Overdrive temperature switch wire (air conditioning)

j. Oxygen sensor and igniter wire

k. Vacuum Switching Valve (VSV) wire (air conditioning)

l. Cold start injector time switch wire

m. Water temperature sensor wire

9. Disconnect the fuel hose from the delivery pipe with the pulsation dampener and gaskets.

10. Remove the injectors from the engine. Take care in handling the injectors.

NOTE: Injector performance tests are possible but special tools are required. If these tools are unavailable, use the test procedures above.

11. To install, use new O-rings and reverse the removal procedures. Torque the hold-down bolts to 14 ft. lbs. Check for fuel leakage.

NOTE: Each injector should

have 4 insulators. Prior to installation, coat the O-rings with clean gasoline. Prior to tightening the hold-down bolts, make sure that the injector rotates smoothly in its bore. If not, the O-rings are twisted.

EMISSION CONTROLS

Please refer to "Emission Control" in the Unit Repair section for system maintenance procedures. Due to the complex nature of modern electronic engine control systems, comprehensive diagnosis and testing procedures fall outside the confines of this repair manual. For complete information on diagnosis, testing and repair procedures concerning all modern engine and emission control systems, please refer to "Chilton's Guide to Electronic Engine Controls".

ENGINE MECHANICAL

Engine

REMOVAL & INSTALLATION

22R, 22R-E and 22R-TE Engines

1. Disconnect the negative battery cable.

2. Remove the engine undercover.

3. Disconnect the windshield washer hose and then remove the hood. Scribe matchmarks around the hinges for easy installation.

4. Drain the engine oil. Drain the engine coolant from the radiator and the cylinder block.

5. Drain the automatic transmission fluid on models so equipped.

6. Disconnect the air cleaner hose and then remove the air cleaner.

7. Remove the radiator and shroud. Disconnect the No. 1 turbocharger water line on the 22R-TE.

8. Remove the coupling fan.

9. Disconnect the heater hoses at the engine.

10. On vehicles with automatic transmissions, disconnect the accelerator and throttle cables at their bracket.

11. Disconnect the following:
 - a. No. 1 and No. 2 PCV hoses
 - b. Brake booster hose
 - c. Air control valve hoses
 - d. EVAP hose at the canister
 - e. Actuator hose on vehicles with cruise control
 - f. Vacuum modulator hose at the EGR valve
 - g. Air valve hoses at the throttle body and chamber
 - h. Two water bypass hoses at the throttle body
 - i. Air control valve hose at the actuator
 - j. Pressure regulator hose at the chamber
 - k. Cold start injector pipe
 - l. BVSV hose.
12. Tag and disconnect the cold start injector wire and the throttle position sensor wire.
13. Remove the EGR valve from the throttle chamber.
14. Disconnect the throttle chamber at the stay. Remove the chamber-to-intake manifold mounting bolts and lift off the throttle chamber.
15. Tag and disconnect the following wires:
 - a. Cold start injector time switch wire
 - b. Water temperature sensor wire
 - c. On vehicles with air conditioning: VSV and air conditioning compressor wires
 - d. Oxygen sensor wire (22R-TE only)
 - e. OD temperature switch wire (with automatic transmission)
 - f. Injector wires
 - g. Knock sensor connector
 - h. Air valve wire
 - i. Oil pressure switch wire
 - j. Starter wire.
16. Remove the power steering pump from its bracket (if equipped). Disconnect the ground strap from the bracket.
17. On vehicles with air conditioning, loosen the drive belt and remove the air conditioning compressor. Position it out of the way with the refrigerant lines still attached.
18. Disconnect the engine ground straps at the rear and right side of the engine.
19. On vehicles with a manual transmission, remove the shift lever from inside the vehicles.
20. Raise and safely support the vehicle. Drain the engine oil. Remove the rear driveshaft.
21. On vehicles with automatic transmission, disconnect the manual shift linkage at the neutral start switch. On 4WD vehicles with automatic transmission, disconnect the transfer shift linkage.
22. Disconnect the speedometer ca-

ble. Be sure not to lose the felt dust protector and washers.

23. Remove the transfer case undercover on 4WD vehicles.

24. Remove the stabilizer bar on 4WD vehicles.

25. Remove the front driveshaft on 4WD vehicles.

26. Remove the No. 1 frame crossmember.

27. Disconnect the front exhaust pipe at the manifold and tail pipe and remove the exhaust pipe.

28. On vehicles with manual transmission, remove the clutch release cylinder and its bracket from the transmission.

29. Remove the No. 1 front floor heat insulator and the brake tube heat insulator on 4WD.

30. On 2WD vehicles, remove the rear engine mount bolts, raise the transmission slightly with a floor jack and then remove the support member mounting bolts.

31. On 4WD vehicles, remove the 4 rear engine mount bolts, raise the transmission slightly with a floor jack and then remove the bolts from the side member and remove the No. 2 frame crossmember.

32. Lower the vehicle. Attach an engine hoist chain to the lifting brackets on the engine. Remove the engine mount nuts and bolts and slowly lift the engine/transmission out of the truck.

To install:

33. Slowly lower the engine assembly into the engine compartment.

34. Raise the transmission onto the crossmember with a floor jack.

35. Align the holes in the engine mounts and the frame, install the bolts and then remove the engine hoist chain.

36. On 2WD vehicles, raise the transmission slightly and align the rear engine mount with the support member and tighten the bolts to 9 ft. lbs. (13 Nm). Lower the transmission until it rests on the extension housing and then tighten the bracket mounting bolts to 19 ft. lbs. (25 Nm).

37. On 4WD vehicles, raise the transmission slightly and tighten the No. 2 frame crossmember-to-side frame bolts to 70 ft. lbs. (95 Nm). Lower the transmission and tighten the rear engine mount bolts to 9 ft. lbs. (13 Nm).

38. On 4WD vehicles, install the brake tube and front floor heat insulators.

39. Install the clutch release cylinder and its bracket to the manual transmission. Tighten the bracket bolts to 29 ft. lbs. (39 Nm) and the cylinder bolts to 9 ft. lbs. (13 Nm).

40. Reconnect the exhaust pipe. Install the No. 1 frame crossmember.

41. On 4WD vehicles, install the front driveshaft, stabilizer bar and the transfer case undercover.

42. Connect the speedometer cable. Connect the transfer shift linkage on 4WD vehicles with automatic transmission.

43. Connect the manual shift linkage to the neutral start switch (automatic transmission only).

44. Install the rear driveshaft. Install the shift lever (manual transmission only).

45. Connect the engine ground straps. Install the air conditioning compressor.

47. Install the power steering pump and connect the ground strap.

48. Connect all of the following wires:

- a. Cold start injector time switch wire
- b. Water temperature sensor wire
- c. On vehicles with air conditioning: VSV and air conditioning compressor wires
- d. Oxygen sensor wire (22R-TE only)
- e. OD temperature switch wire (with automatic transmission)
- f. Injector wires
- g. Knock sensor connector
- h. Air valve wire
- i. Oil pressure switch wire
- j. Starter wire

49. Connect all of the following parts:

- a. No. 1 and No. 2 PCV hoses
- b. Brake booster hose
- c. Air control valve hoses
- d. EVAP hose at the canister
- e. Actuator hose on vehicles with cruise control
- f. Vacuum modulator hose at the EGR valve
- g. Air valve hoses at the throttle body and chamber
- h. Two water bypass hoses at the throttle body
- i. Air control valve hose at the actuator
- j. Pressure regulator hose at the chamber
- k. Cold start injector pipe
- l. BVSV hose.

50. Connect the accelerator and throttle cables to the bracket (automatic transmission only).

51. Connect the heater hoses and install the coupling fan. Install the radiator and shroud.

52. Install the air cleaner. Refill the engine with oil and the radiator with coolant. Install the engine undercover.

53. Install and adjust the hood.

54. Connect the battery cable, start the engine and road test the vehicle.

4Y-E and 4Y-EC Engines

1. Disconnect the negative battery terminal from the battery.

2. Remove the right seat and the engine service hole cover.

3. Drain the coolant from the radiator. Remove the reservoir tank, the heater hoses and the radiator.

4. Remove the air cleaner, the breather tube, the brake booster, the charcoal canister and the fuel hoses from the engine.

5. If equipped with power steering, remove the drive belt, the pulley, the woodruff key and the pump from the engine, then, move the pump aside.

NOTE: When removing the power steering pump, do not disconnect the pressure lines unless it is absolutely necessary.

6. Disconnect the accelerator cable with the bracket from the throttle body.

7. Disconnect the following wiring connectors from the: water temperature sender, oil pressure switch, IIA unit, air conditioning compressor, idle-up solenoid, VSV, water temperature switch (automatic transmission), alternator connector and wire, air flow meter and solenoid resistor.

8. Remove the fan shroud, the fan, the fluid coupling and the water pump pulley.

9. From inside the vehicle, remove the center pillar cover, the seat belt retractor and cover, then, disconnect the electrical connectors from the ECU.

10. If equipped with A/C, remove the drive belt and the compressor mounting bolts, then, move the compressor aside.

11. Raise and safely support the vehicle.

12. Drain the engine oil. Remove the driveshaft and the front exhaust pipe.

13. Remove the transmission selector and shift cables, then, the clutch release cylinder (manual transmission).

14. Disconnect the starter wires, the mounting bolts and the starter from the engine.

15. Remove the speedometer cable, the bond cable and the back-up light switch connector.

16. If equipped with a rear heater, disconnect the mode selector and the air mix damper cable from the damper. Disconnect the heater hoses to the rear heater unit.

17. Disconnect the bond cable(s) from the engine mount(s). Remove the engine under cover.

18. Disconnect the oil level sensor and the oil cooler hoses (if equipped with automatic transmission).

19. Place matchmarks on the front strut bar and the rear mounting nut. Remove the rear nut, the strut bar-to-lower control arm bolts and the strut.

20. Using an engine saddle, place it

under the engine and support it. Place a floor jack under the transmission and support it.

NOTE: If equipped with a manual transmission, remove the engine rear mounting bracket from the body. If equipped with automatic transmission, remove the engine mounting member-to-transmission through bolt.

21. Remove the engine mounts-to-body nuts/bolts and lower the engine/transmission assembly, then, remove the engine mounting member from the engine.

22. Remove the transmission from the engine.

23. To install, reverse the removal procedures. Refill the engine with oil and the cooling system with coolant.

2F Engine

1. Scribe marks on the hood and hinges to aid in alignment during installation. Remove the hinge bolt from the hood and then remove the hood.

2. Raise and safely support the vehicle. Drain the cooling system and engine oil. Lower the vehicle.

3. Unfasten the radiator grille mounting bolts and remove the grille.

4. Remove the hood latch support rod. Detach the hood latch assembly from the radiator upper bracket. Remove the bracket.

5. Disconnect the heater hose from the radiator.

6. Detach the upper radiator hose at the water outlet housing and the lower hose at water pump.

7. Remove the 6 bolts which secure the radiator and lift the radiator out of the vehicle.

8. Remove the heater hoses from the water valve and heater box. Disconnect the temperature control cable from the water valve.

9. Detach both the battery cables and remove the battery.

10. Remove the wires from the starter solenoid terminal.

11. Detach the fuel lines from the pump and remove the fuel filter assembly.

12. Disconnect the primary wire from the ignition coil.

13. Detach both of the intermediate rods from the shifter shafts (column shift vehicles only).

14. Remove the air cleaner assembly, complete with hoses, from its bracket.

15. Remove the emission control system cables and hoses as necessary.

16. Disconnect the alternator wires.

17. Disconnect the hand throttle, accelerator, and choke linkage from the carburetor.

18. On vehicles equipped with vacuum assisted 4WD engagement, remove

the control unit vacuum hose from its manifold fitting.

19. Disconnect the oil pressure and water temperature gauge sender's wiring.

20. Unfasten the downpipe from the exhaust manifold.

21. Detach the parking brake cable from the intermediate lever.

22. Raise and safely support the vehicle. Unbolt the front driveshaft from the flange on the transfer case output shaft.

23. Remove both the left and right engine stone shields. Remove the transmission skidplate.

24. Remove the cotter pin and disconnect both the high and low range shifter link lever and the high/low shift rod.

25. Remove the high/low range shifter link lever and the high/low shift rod.

26. Disconnect the clutch release fork spring. Remove the clutch release cylinder from its mounting bracket at the rear of the engine.

27. Unfasten the clamp screws and withdraw the vacuum lines from the transfer case control unit vacuum chamber (only on vehicles with vacuum assist 4WD engagement).

28. Remove the 4WD indicator switch assembly.

29. Unfasten the speedometer cable from the transmission.

31. Detach the gearshift rod and gear selector rod from the shift outer lever and the gear selector outer lever respectively.

32. Unbolt the rear engine mounts from the frame. Remove the front engine mounts. Lower the vehicle.

34. Install lifting hooks on the engine lift points and connect a suitable hoist.

35. Lift the engine slightly and toward the front, so the engine/transmission assembly clears the front of the vehicle.

To install:

36. Lower the engine into position in the vehicle.

37. Install the engine mounts and bolts. Attach the gearshift rod and gear selector rod to the shift outer lever and the gear selector outer lever respectively.

38. Install the speedometer cable to the transmission. Install the 4WD indicator switch assembly.

39. Install the vacuum lines to the transfer case control unit vacuum chamber (only on vehicles with vacuum assist 4WD engagement).

40. Connect the clutch release fork spring. Install the clutch release cylinder in its mounting bracket at the rear of the engine.

41. Install the high/low range shifter link lever and the high/low shift rod.

42. Connect both the high and low range shifter link lever and the high/low shift rod. Install the left and right engine stone shields. Install the transmission skid plate.

43. Install the front driveshaft. Attach the parking brake cable to the intermediate lever.

44. Fasten the downpipe to the exhaust manifold. Connect the oil pressure and water temperature gauge sender's wiring.

45. Connect accelerator, and choke linkage to the carburetor. Connect the alternator wires.

46. Connect all hoses and wiring. Connect the shifter rods. Install the battery. Install the water valve and cable.

47. Install the radiator and hoses. Install the hood latch and grille.

48. Install the hood. Refill the cooling system and the crankcase.

3F-E Engine

1. Disconnect the negative battery cable. Drain the engine coolant.

2. Scribe matchmarks around the hood hinges and then remove the hood.

3. Remove the battery and its tray.

4. Disconnect the accelerator and throttle cables.

5. Remove the air intake hose, air flow meter and air cleaner assembly.

6. Remove the coolant reservoir tank.

7. Remove the radiator.

8. Tag and disconnect the following wires and connectors:

- Oil pressure connector
- High tension cord at the coil
- Neutral start switch and transfer connectors near the starter
- Front differential lock connector
- Starter wire and connector
- Starter ground strap
- O₂ sensor connectors
- Alternator wire and connector
- Cooling fan connector
- Check connector

9. Disconnect the following hoses:

- Heater hoses
- Fuel hoses
- Transfer case hose
- Brake booster hose
- Air injection hoses
- Distributor hose
- Emission control hoses

10. Remove the glove box, pull out the 4 connectors and then pull the EFI wiring harness from the cowl.

11. Unbolt the power steering pump and position it out of the way with the hoses still connected.

12. Do the same with the air conditioning compressor.

13. Raise the vehicle and remove the transfer case undercover. Drain the engine oil.

14. Remove the front and rear driveshafts.

15. Disconnect the speedometer cable.

16. Disconnect the engine ground strap.

17. Disconnect the 2 vacuum hoses at the diaphragm cylinder underneath the transfer case.

18. Remove the clip and pin and then disconnect the shift rod at the transfer case. Remove the nut, disconnect the washers and the shift lever at the shift rod.

19. Disconnect the transmission control rod.

20. Disconnect the exhaust pipe at the manifold.

21. With a floor jack under the transmission, remove the bolts and nuts that attach the frame crossmember and then remove the crossmember. Lower the vehicle.

22. Attach an suitable engine hoist to the lifting brackets on the engine. Remove the engine mount nuts and bolts and slowly lift the engine/transmission out of the vehicle.

To install:

23. Slowly lower the engine assembly into the engine compartment.

24. Raise the transmission onto the crossmember with a suitable floor jack.

25. Align the holes in the engine mounts and the frame, install the bolts and then remove the engine hoist chain.

26. Raise the transmission slightly and tighten the frame crossmember-to-chassis bolts to 29 ft. lbs. (39 Nm). Tighten the 2 nuts to 43 ft. lbs. (59 Nm).

27. Install the exhaust pipe with a new gasket and tighten the nuts to 46 ft. lbs. (62 Nm).

28. Connect the transmission control rod. Connect the transfer case shift lever.

29. Connect the engine ground strap. Connect the speedometer cable.

30. Install the front and rear driveshafts. Tighten the nuts to 65 ft. lbs. (88 Nm).

31. Install the transfer case undercover. Install the air conditioning compressor. Install the power steering pump and tighten the pulley nut to 35 ft. lbs. (47 Nm).

32. Connect the EFI wiring harness at the ECU. Connect all of the following hoses:

- Heater hoses
- Fuel hoses
- Transfer case hose
- Brake booster hose
- Air injection hoses
- Distributor hose
- Emission control hoses.

33. Connect all of the following the wires and connectors:

- Oil pressure connector
- High tension cord at the coil
- Neutral start switch and transfer connectors near the starter
- Front differential lock connector
- Starter wire and connector
- Starter ground strap
- Oxygen sensor connectors
- Alternator wire and connector
- Cooling fan connector
- Check connector

34. Install the radiator and the coolant reservoir tank.

35. Install the air intake hose, air flow meter and air cleaner. Connect the accelerator and throttle cables.

36. Refill the engine with oil and the radiator with coolant. Install the engine undercover. Install the battery.

37. Install and adjust the hood.

38. Install the battery, start the engine and road test the vehicle.

3VZ-E Engine

1. Disconnect the battery cables and remove the battery.

2. Remove the engine undercover.

3. Disconnect the windshield washer hose and then remove the hood. Scribe matchmarks around the hinges for easy installation.

4. Drain the engine coolant from the radiator and the cylinder block.

5. Raise and safely support the vehicle. Drain the engine oil. Drain the automatic transmission fluid, on vehicles so equipped.

6. Lower the vehicle. Disconnect the air cleaner hose and then remove the air cleaner.

7. Remove the radiator.

8. Remove all drive belts and then remove the fluid coupling and fan pulley.

9. Tag and disconnect the following wires and connectors:

- Left side and rear ground straps
- Alternator connector and wire
- Igniter connector
- Oil pressure switch connector
- ECU connectors
- VSV connectors
- Starter relay connector (manual transmission only)
- Solenoid resistor connector
- Check connector
- Air conditioning compressor connector

10. Tag and disconnect the following hoses:

- Power steering hoses at the gas filter and air pipe
- Brake booster hose
- Cruise control vacuum hose (if equipped)
- Charcoal canister hose at the canister
- VSV vacuum hoses.

11. Disconnect the accelerator, throttle and cruise control cables where applicable.

12. Unbolt the power steering pump and position it out of the way with the hydraulic lines still connected.

13. Properly discharge the air conditioning system. Remove the air conditioning compressor if equipped.

14. Disconnect the clutch release cylinder hose (manual transmission only).

15. Disconnect the 2 heater hoses.

16. Disconnect and plug the fuel inlet and outlet lines.

17. Remove the shift levers (manual transmission only).

18. Raise and safely support the vehicle. Remove the rear driveshaft.

19. Disconnect the manual shift linkage (automatic transmission only).

20. Disconnect the speedometer cable, don't lose the felt dust protector and washers.

21. Remove the transfer case undercover. Remove the stabilizer bar.

22. Remove the front driveshaft. Remove the front exhaust pipe.

23. Remove the No. 1 front floor heat insulator and the brake tube heat insulator.

24. Remove the rear engine mount bolts, raise the transmission slightly with a floor jack and then remove the 4 bolts from the side member and remove the No. 2 frame crossmember. Lower the vehicle.

25. Attach an engine hoist chain to the lifting brackets on the engine. Remove the engine mount nuts and bolts and slowly lift the engine/transmission out of the vehicle.

To install:

26. Slowly lower the engine assembly into the engine compartment.

27. Raise the transmission onto the crossmember with a floor jack.

28. Align the holes in the engine mounts and the frame, install the bolts and then remove the engine hoist chain.

29. Raise the transmission slightly and tighten the No. 2 frame crossmember-to-side frame bolts to 70 ft. lbs. (95 Nm). Lower the transmission and tighten the 4 rear engine mount bolts to 9 ft. lbs. (13 Nm).

30. Install the brake tube and front floor heat insulators. Reconnect the exhaust pipe.

31. Install the No. 1 frame crossmember. Install the front driveshaft, stabilizer bar and the transfer case undercover.

32. Connect the speedometer cable. Connect the manual shift linkage (automatic transmission only).

33. Install the rear driveshaft. Install the shift levers (manual transmission only).

34. Install the fuel inlet and outlet lines. Connect the heater hoses.

35. Connect the clutch release cylinder hose. Install the air conditioning compressor.

36. Install the power steering pump and connect the ground strap.

37. Connect the throttle, cruise control and accelerator cables.

38. Connect the following hoses:

a. Power steering hoses at the gas filter and air pipe

b. Brake booster hose

c. Cruise control vacuum hose (if equipped)

d. Charcoal canister hose at the canister

e. VSV vacuum hoses.

39. Install the fan pulley, belt guide, fluid coupling and drive belt. Connect the following wires:

a. Left side and rear ground straps

b. Alternator connector and wire

c. Igniter connector

d. Oil pressure switch connector

e. ECU connectors

f. VSV connectors

g. Starter relay connector (manual transmission only)

h. Solenoid resistor connector

i. Check connector

j. Air conditioning compressor connector

40. Install the air conditioning belt. Install the power steering pump and connect the ground strap.

41. Install the radiator and shroud. Install the air cleaner. Refill the engine with oil and the radiator with coolant.

Cylinder head bolt removal sequence—22R, 22R-E and 22R-TE engines

Cylinder head bolt installation sequence—22R, 22R-E and 22R-TE engines

Exploded view of the cylinder head assembly—22R, 22R-E and 22R-TE engines

42. Install the engine undercover. Install the battery. Install and adjust the hood.

43. Install the battery, start the truck and road test it.

Cylinder Head

REMOVAL & INSTALLATION

22R Engine

1. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Mark all vacuum hoses and disconnect them.

4. Remove the air cleaner assembly, complete with hoses, from the carburetor.

NOTE: Cover the carburetor with a clean shop cloth so that nothing can fall into it.

5. Remove all linkages, fuel lines, etc., from the carburetor, cylinder head, and manifolds. Remove the wire supports.

6. Mark the spark plug leads and disconnect them from the plugs.

7. Matchmark the distributor housing and block. Disconnect the primary lead and remove the distributor.

8. Unfasten the 14mm nuts which secure the cam cover. Remove the cam cover.

9. Remove the rubber camshaft seals. Turn the crankshaft until the No. 1 piston is at TDC on its compression stroke. Match mark the timing sprocket to the cam chain, and remove the semi-circular lug. Using a 19mm wrench, remove the cam sprocket bolt. Slide the distributor drive gear and spacer off the cam and wire the cam sprocket in place.

10. Remove the timing chain cover 14mm bolt at the front of the head. This must be done before the head bolts are removed. Remove the exhaust pipe flange nuts and disconnect the pipe.

11. Remove the cylinder head bolts in the correct order. Improper removal could cause head damage.

12. Using pry bars applied evenly at the front and the rear of the valve rocker assembly, pry the assembly off its mounting dowels.

13. Lift the head off its dowels. Do not pry it off.

14. Drain the engine oil from the crankcase after the head has been removed, because the oil will become contaminated with coolant while the head is being removed.

To install:

15. Apply liquid sealer to the front corners of the block and install the head gasket.

16. Lower the head over the locating dowels. Do not attempt to slide it into place.

17. Rotate the camshaft so that the sprocket aligning pin is at the top. Remove the wire and hold the cam sprocket. Manually rotate the engine so that the sprocket hole is also at the top. Wire the sprocket in place.

18. Install the rocker arm assembly over its positioning dowels.

19. Tighten the cylinder head bolts evenly, in 3 stages and in the correct order.

20. Install the timing chain cover bolt and tighten it to 7-11 ft. lbs.

21. Remove the wire and fit the sprocket over the camshaft dowel. If the chain won't allow the sprocket to reach, rotate the crankshaft back and forth, while lifting up on the chain and sprocket.

22. Install the distributor drive gear and tighten the crankshaft bolt to 51-65 ft. lbs.

23. Set the No. 1 piston at TDC of its compression stroke and adjust the valves.

24. After completing valve adjustment, rotate the crankshaft 352 degrees, so that the 8 BTDC mark on the pulley aligns with the pointer.

25. Install the distributor.

26. Install the spark plugs and leads.

27. Make sure that the oil drain plug is installed. Fill the engine with oil after installing the rubber cam seals. Pour the oil over the distributor drive gear and the valve rockers.

28. Install the rocker cover and tighten the bolts to 8-11 ft. lbs.

29. Connect all the vacuum hoses and electrical leads which were removed during disassembly. Install the spark plug lead supports. Fill the cooling system. Install the air cleaner.

30. Tighten the exhaust pipe-to-manifold flange bolts to 25-33 ft. lbs.

31. Reconnect the battery. Start the engine and allow it to reach normal operating temperature. Check and adjust the timing and valve clearance. Adjust the idle speed and mixture. Road test the vehicle.

22R-E and 22R-TE Engines

1. Relieve the fuel system pressure. Disconnect the negative battery cable.

2. Drain the coolant from the radiator and the cylinder block. Raise and safely support the vehicle. Drain the engine oil.

3. Remove the turbocharger on the 22R-TE engine.

4. Disconnect and remove the air cleaner hose on the 22R-E engine.

5. Disconnect the oxygen sensor wire. Remove the nuts attaching the manifold to the exhaust pipe and then separate them.

6. Remove the oil dipstick. Remove the distributor with the spark plug leads attached.

7. Disconnect the upper radiator hose and the heater hoses where they attach to the engine and then position them out of the way.

8. Disconnect the actuator cable, the accelerator cable and the throttle cable for the automatic transmission at their bracket.

9. Tag and disconnect the following:

- Both PCV vacuum hoses
- Brake booster hose
- Actuator hose (if equipped with cruise control)
- Air control valve hoses
- Air control valve.

10. Tag and disconnect the EGR vacuum modulator hoses and then remove the modulator itself along with the bracket.

11. Tag and disconnect the following:

- Green and brown BVSV hoses
- Vacuum advance hoses
- The 2 air valve hoses; one at the throttle body, the other at the air chamber
- Air control valve hose (if equipped with air conditioning)
- Pressure regulator hose at the air chamber
- Cold start injector pipe and wire

g. Throttle position sensor wire.

12. Remove the bolt holding the EGR valve to the air chamber. Disconnect the chamber from the stay. Remove the air chamber-to-intake manifold bolts and then lift off the chamber with the throttle body.

13. Disconnect the fuel return hose.

14. Tag and disconnect the following:

- Water temperature sender gauge wire
- Temperature sensor wire
- Start injection time switch wire
- Fuel injector wires.

15. Remove the pulsation damper. Remove the bolt holding the fuel hose to the delivery pipe and then disconnect and remove the fuel hose.

16. Disconnect the wire and hose and then remove the air valve from the intake manifold.

17. Disconnect the bypass hose at the intake manifold on the 22R-E engine. On the 22R-TE engine, disconnect the oil cooler hose at the manifold.

18. If equipped with power steering, remove the pump and position it out of the way without disconnecting the hydraulic lines.

19. Remove the 4 nuts and then remove the cylinder head cover.

20. Remove the rubber camshaft seals. Turn the crankshaft until the No. 1 piston is at TDC of its compression stroke. Matchmark the timing sprocket to the timing chain and then

remove the semi-circular plug. Using a 19mm wrench, remove the camshaft sprocket bolt. Slide the distributor drive gear and spacer off the camshaft and wire the cam sprocket in place.

21. Remove the timing chain cover bolt in front of the cylinder head.

NOTE: This must be done before the cylinder head bolts are removed.

22. Remove the cylinder head bolts gradually, in 2 or 3 stages, in the correct order.

23. Using pry bars applied evenly at the front and rear of the rocker arm assembly, pry the assembly off of its mounting dowels.

24. Lift the cylinder head off of its mounting dowels.

To install:

25. Apply liquid sealer to the front corners of the block and install the head gasket.

26. Lower the head over the locating dowels. Do not attempt to slide it into place.

27. Rotate the camshaft so that the sprocket aligning pin is at the top. Remove the wire and hold the cam sprocket. Manually rotate the engine so that the sprocket hole is also at the top. Wire the sprocket in place.

28. Install the rocker arm assembly over its positioning dowels.

29. Tighten the cylinder head bolts evenly, in 3 stages and in the correct order.

30. Install the timing chain cover bolt and tighten it to 7-11 ft. lbs.

31. Remove the wire and fit the sprocket over the camshaft dowel. If the chain won't allow the sprocket to reach, rotate the crankshaft back and forth, while lifting up on the chain and sprocket.

32. Install the distributor drive gear and tighten the crankshaft bolt to 51-65 ft. lbs.

33. Set the No. 1 piston at TDC of its compression stroke and adjust the valves.

34. After completing valve adjustment, rotate the crankshaft 352 degrees, so that the 8 BTDC mark on the pulley aligns with the pointer.

35. Install the distributor.

36. Install the spark plugs and leads.

37. Make sure that the oil drain plug is installed. Fill the engine with oil after installing the rubber cam seals. Pour the oil over the distributor drive gear and the valve rockers.

38. Install the rocker cover and tighten the bolts to 8-11 ft. lbs.

39. Connect all the vacuum hoses and electrical leads which were removed during disassembly. Install the

spark plug lead supports. Fill the cooling system. Install the air cleaner.

40. Tighten the exhaust pipe-to-manifold flange bolts to 25-33 ft. lbs.

41. Reconnect the battery. Start the engine and allow it to reach normal operating temperature. Check and adjust the timing and valve clearance. Adjust the idle speed and mixture. Road test the vehicle.

4Y-E and 4Y-EC Engines

1. Disconnect the negative battery terminal from the battery.

2. Remove the right-front seat and the engine service hole cover.

3. Raise and safely support the vehicle. Drain the engine coolant at the radiator. Drain the engine oil. Lower the vehicle.

4. If equipped with power steering, perform the following:

a. Remove the air hoses from the air control valve

b. Drain the fluid from the reservoir tank

c. Disconnect the return hose from the pump

d. Disconnect the pressure hose from the pump

e. Remove the drive belt, the pulley nut, the pulley, the Woodruff key, the mounting bolts and the pump

5. Remove the exhaust pipe and the bracket. Remove the air cleaner pipe and the hoses.

6. Disconnect the accelerator cable with the bracket from the throttle body.

7. Disconnect the water temperature sender gauge connector from the cylinder head.

8. Disconnect the following EFI connectors from the:

a. The water thermo sensor

b. The cold start injector time switch

c. The cold start injector

d. The air valve

e. The throttle position sensor

f. The oxygen sensor

g. The water temperature switch

9. Disconnect the following hoses from the:

a. The radiator inlet

b. The radiator breather

c. The reserve tank

d. The heater outlet

e. The PCV valve

f. The water bypass

g. The brake booster vacuum

h. The charcoal canister

i. Label and disconnect the emission control

10. Remove the throttle body from the air intake chamber.

11. Remove the EGR valve nuts from the intake chamber and the exhaust manifold-to-EGR valve union.

12. Disconnect the cold start injector pipe, the water by-pass hoses and the pressure regulator hose.

13. Using a 12mm offset box wrench, remove the air intake chamber brackets, then, the chamber with the air valve.

14. Remove the wire clamp bolts and the injector connectors from the injectors.

15. Remove the exhaust manifold bracket, the heater pipe bracket, the fuel inlet pipe union bolt from the fuel filter and the fuel outlet hose.

16. Remove the spark plugs and the tubes.

17. Remove the cap nuts, the seal washers, the cylinder head cover and the gasket.

18. Remove the rocker arm shaft assembly nuts/bolts a little at a time, in 3-4 steps. Remove the push rods, keeping them in order.

19. Remove the cylinder head bolts, a little at a time, in 3 passes. Lift the cylinder head off of the engine.

20. Remove the valve lifters from the cylinder block.

To install:

21. Clean the gasket mounting surfaces.

22. To install, use new gaskets and reverse the removal procedures. Torque the cylinder head bolts (in 3 passes) to 65 ft. lbs. (14mm) or 14 ft. lbs. (12mm), the rocker arm shaft-to-cylinder head bolts (in 3 passes) to 17 ft. lbs., the spark plugs to 13 ft. lbs., the air intake chamber bolts to 9 ft. lbs., the throttle body-to-intake chamber to 9 ft. lbs. and the exhaust pipe-to-exhaust manifold to 29 ft. lbs.

23. Adjust the drive belts.

24. Refill the cooling system and the engine with oil.

25. Check and/or adjust the timing.

NOTE: Use special tool No. 09270-71010, or its equivalent, to

Cylinder head bolt removal sequence and installation sequence—2F engine

hold the push rods in position when installing the push rods.

2F Engine

1. Disconnect the negative battery cable and drain the cooling system.
2. Remove the air cleaner assembly from its bracket.
3. Detach the accelerator cable from its support on the cylinder head cover and also from the carburetor throttle arm.
4. Remove the choke cable and fuel lines from the carburetor.
5. Remove the water hose bracket from the cylinder head cover.
6. Unfasten the water hose clamps and remove the hoses from the water pump and the water valve. Detach the heater temperature control cable from the water valve.
7. Disconnect the PCV line from the cylinder head cover.
8. Disconnect the vacuum lines, which run from the vacuum switching valve, at the various components of the emission control system.
9. Raise and safely support the vehicle. Drain the engine oil. Unfasten the oil lines from the oil filter and remove the filter assembly from the manifold. Lower the vehicle.
10. Detach the vacuum valve solenoid wire from the coil.
11. Disconnect any remaining lines from the carburetor and remove the carburetor from the manifold.
12. Unfasten the alternator adjusting link and then remove the drive belt and the alternator.
13. Disconnect the distributor vacuum line from the distributor. Remove the wire from its supports on the head.
14. Disconnect the carburetor fuel line from the fuel pump. Remove the line.
15. Disconnect the spark plug and coil cables, after marking their respective locations.
16. Unfasten the primary wire from the distributor. Remove the distributor clamp bolts and remove the distributor.
17. Remove the oil gauge sending unit.
18. Remove the coil from its bracket on the cylinder head.
19. Remove the fuel pump.
20. Remove the oil filter tube clamping bolt from the valve lifter (side) cover. Drive the oil filler tube out of the cylinder block.
21. Remove the combination intake/exhaust manifold from the cylinder block.
22. Take off the cylinder head cover and its gasket.
23. Unfasten the oil delivery union, spring, and sleeve from the valve rocker shafts.

24. Unfasten the securing nuts and bolts from the valve rocker shaft supports. Withdraw the rocker assembly.

25. Withdraw the pushrods from their bores. Be sure to keep them in the same order in which they were removed.

26. Remove the valve lifter (side) cover and gasket.

27. Withdraw the valve lifters from the block.

NOTE: The valve lifters should be kept, with their respective pushrods, in the sequence in which they were removed.

28. Unfasten the oil delivery union from the oil feed pipe.

29. Loosen the cylinder head bolts in stages, in the correct sequence.

30. Lift off the cylinder head and the gasket.

To install:

31. Clean the gasket mounting surfaces of both the cylinder head and block.

32. Place a new head gasket over the dowels on the block.

33. Lower the cylinder head on to the block.

34. Tighten the bolts, in stages, and in the proper sequence, to the specified torque.

35. Install the oil feed pipe.

36. Install the valve lifters.

37. Install the valve rocker assembly, oil delivery union, spring and connecting sleeve in the head. Tighten the rocker assembly support nuts and bolts to the following torque specifications, in several stages:

10mm nuts and bolts: 24–30 ft. lbs.

8mm bolts: 14–22 ft. lbs.

38. Adjust the valves to the cold specifications (each piston TDC of its compression stroke).

NOTE: Adjust the valve clearance again after the engine is assembled and warmed up.

39. The rest of the cylinder head installation is performed in the reverse order of the removal procedure.

3F-E Engine

1. Drain the coolant.
2. Disconnect the negative battery cable.
3. Scribe matchmarks around the hood hinges and then remove the hood.
4. Disconnect the accelerator and throttle cables.
5. Remove the air intake hose, air flow meter and air cleaner cap.
6. Unbolt the power steering pump and position it out of the way without disconnecting the hydraulic lines.
7. Unbolt the air conditioning com-

pressor and position it out of the way without disconnecting the refrigerant lines.

8. Remove the power steering pump and air conditioning compressor brackets.

9. Disconnect the high tension leads from the spark plugs and the coil.

10. Disconnect and remove the heater water (oil cooler) pipe.

11. Disconnect the upper radiator hose.

12. Disconnect and plug the fuel lines.

13. Disconnect the exhaust pipe at the manifold.

14. Remove the air pump.

15. Remove the fuel delivery pipe along with the fuel injectors.

16. Remove the air injection manifold.

17. Remove the intake and exhaust manifolds.

18. Disconnect the water bypass hose at the water outlet and then remove the outlet.

19. Remove the spark plugs.

20. Remove the cylinder head cover and its gasket.

21. Loosen the bolts and nuts that attach the rocker shaft assembly in several stages and then remove the rocker shaft.

22. Remove the pushrods.

23. Remove the cylinder head bolts in the reverse of the tightening sequence. Remove the air pump bracket and engine hanger.

24. Lift the cylinder head off of its mounting dowels.

To install:

25. Install the cylinder head on the cylinder block using a new gasket.

26. Lightly coat the threads of the cylinder head bolts with engine oil and then install them into the head. Tighten in several stages, to the correct torque.

27. Install the pushrods in the order that they were removed.

28. Position the rocker shaft assembly on the cylinder head and align the rocker arm adjusting screws with the heads of the pushrods. Tighten the mounting bolts with a 12mm head to 17 ft. lbs. (24 Nm); tighten the bolts with a 14mm head to 25 ft. lbs. (33 Nm).

29. Adjust the valve clearance and install the spark plugs. Install the cylinder head cover and tighten the cap nuts to 78 inch lbs. (8.8 Nm).

30. Install the water outlet and connect the bypass hose. Tighten the bolts to 18 ft. lbs. (25 Nm).

31. Install the intake and exhaust manifolds using a new gasket. Make sure the front mark on the gasket is towards the front of the engine.

32. Install the heat insulators and the manifold stay.

33. Install the air injection manifold and tighten the union nuts and clamp bolts to 15 ft. lbs. (21 Nm).

34. Install the fuel injector/delivery pipe assembly.

35. Install the air pump and connect the air hose.

36. Connect the exhaust pipe to the manifold. Use a new gasket and tighten the bolts to 46 ft. lbs. (62 Nm).

37. Connect the fuel lines and the upper radiator hose.

38. Install the heater water pipe.

39. Connect the high tension cords.

40. Install the air conditioning compressor and the power steering pump. Remember to adjust the belt tension later.

41. Install the air intake hose, the air flow meter and the air cleaner cap.

42. Connect and adjust the accelerator and throttle cables.

43. Connect the battery cable, fill the engine with coolant, start the engine and check for any leaks. Road test the vehicle.

3VZ-E Engine

1. Disconnect the negative battery cable.

2. Remove the air cleaner hose and case.

3. Drain the engine coolant.

4. Remove the radiator.

5. Unbolt the power steering pump and position it out of the way with the hoses still attached.

6. Remove all drive belts and then remove the fluid coupling and fan pulley.

7. Tag and disconnect all wires and connectors that will interfere with cylinder head removal.

8. Disconnect the following hoses:

- Power steering air hoses
- Brake booster hose

Cylinder head bolt installation sequence—3F-E engine

Cylinder head bolt removal sequence—3VZ-E engine

Exploded view of the cylinder head assembly—3VZ-E engine

Camshaft bearing cap loosening sequence—3VZ-E engine

Cylinder head gasket installation—3VZ-E engine

Cylinder head bolt tightening sequence—3VZ-E engine

Camshaft bearing cap bolt tightening sequence—3VZ-E engine

- c. Cruise control vacuum hose
- d. Charcoal canister has at the canister
- e. VSV vacuum hose.
- 9. Disconnect the accelerator, throttle and cruise control cables.
- 10. Disconnect the clutch release cylinder hose (manual transmission only).
- 11. Disconnect the heater hoses and the fuel lines.
- 12. Remove the left side scuff plate and disconnect the O₂ sensor and then remove the front exhaust pipe.
- 13. Remove the timing belt as detailed later in this chapter.
- 14. Remove the distributor with the spark plug leads attached; position it out of the way.
- 15. Remove the air intake chamber.
- 16. Disconnect the connectors and then remove the engine wire.
- 17. Remove the Nos. 2 and 3 fuel pipes.
- 18. Remove the No. 4 timing belt cover.
- 19. Remove the No. 2 idler pulley and the No. 3 timing belt cover.
- 20. Disconnect the hose and remove the water bypass outlet.
- 21. Remove the intake manifold.
- 22. Remove the exhaust crossover pipe.

Right side:

- 23. Remove the reed valve with the No. 1 air injection manifold.
- 24. Remove the water bypass pipe mounting bolt.
- 25. Remove the cylinder head cover.
- 26. Remove the camshaft.
- 27. Loosen the cylinder head bolts in several stages, in the opposite order of the tightening sequence. Remove the air pump bracket and engine hanger.
- 28. Lift the cylinder head off of its mounting dowels, do not pry it off.

Left side:

- 29. Remove the alternator.
- 30. Remove the oil dipstick guide tube.
- 31. Remove the cylinder head cover.
- 32. Remove the camshaft.
- 33. Loosen the cylinder head bolts in several stages, in the opposite order of the tightening sequence. Remove the air pump bracket and engine hanger.
- 34. Lift the cylinder head off of its mounting dowels, do not pry it off.

To install:

- 35. Install the cylinder head on the cylinder block using a new gasket.
- 36. Lightly coat the threads of the cylinder head bolts with engine oil and then install them into the head. Tighten them in several stages, in the correct order. After the initial tightening, mark the front side the top of the bolt with paint. Tighten the bolts an additional 90 degrees ($\frac{1}{4}$ turn) and check that the mark is now facing the

side of the head. Tighten the bolts an additional 90 degrees and check that the mark is now facing the rear of the head. Install the bolt (A) and tighten it to 27 ft. lbs. (37 Nm).

- 37. Install the camshaft.
- 38. Install the alternator and the water bypass pipe mounting bolt.
- 39. Install the reed valve with the No. 1 injection manifold.
- 40. Install the oil dipstick tube.
- 41. Install the crossover pipe and tighten it to 29 ft. lbs. (39 Nm).
- 42. Connect the oxygen sensor wire.
- 43. Install the intake manifold with new gaskets and tighten the mounting bolts to 29 ft. lbs. (39 Nm).
- 44. Install the water bypass outlet and tighten the bolts to 13 ft. lbs. (18 Nm).
- 45. Install the fuel delivery pipes and injectors.
- 46. Install the No. 2 idler pulley. Install the Nos. 3 and 4 timing belt covers and tighten the bolts to 74 inch lbs. (8.3 Nm).
- 47. Install the fuel pipes and tighten the union bolts to 22 ft. lbs. (29 Nm).
- 48. Install the timing belt. Install the cylinder head covers.
- 49. Install the air intake chamber and tighten the nuts and bolts to 13 ft. lbs. (18 Nm).
- 50. Install the EGR valve and connect all hoses and lines. Install the distributor and the front exhaust pipe.
- 51. Connect the fuel lines and heater hoses. Connect the clutch release cylinder hose.
- 52. Install the power steering pump. Connect all cables (and adjust), hoses and wires previously removed.
- 53. Install the fan pulley, fluid coupling and drive belts. Install the radiator.
- 54. Install the air cleaner hose, refill the engine with coolant and connect the battery cable.

Valve Lash

ADJUSTMENT

22R, 22R-E and 22R-TE Engines

1. Start the engine and allow it to reach normal operating temperatures (above 175 degrees F).
2. Stop the engine. Remove the air cleaner assembly, the hoses and the bracket, then any cables, hoses, wires and etc., which are attached to the valve cover. Remove the valve cover.
3. Set the No. 1 cylinder to TDC of the compression stroke. Place a wrench on the crankshaft pulley bolt and turn the engine until the notch on the crankshaft pulley is aligned with

Valve adjustment sequence—22R, 22R-E and 22R-TE engines

First step of the valve adjustment procedure—22R, 22R-E and 22R-TE engines

Second step of the valve adjustment procedure—22R, 22R-E and 22R-TE engines

the 0 degree mark on the timing plate; the engine is at TDC.

NOTE: The rocker arms on cylinder No. 1 should be loose and the rocker arms on cylinder No. 4 should be tight.

4. With the engine hot, the valve clearances are 0.008 in. (intake) and 0.012 in. (exhaust).

NOTE: The clearance is measured with a feeler gauge between the valve stem and the adjusting screw.

5. To adjust the valve clearance, loosen the locknut and turn the adjusting screw until the specified clearance is obtained. Tighten the locknut and check the clearance again. Adjust the intake valves of No. 1 and 2 cylinders; the exhaust valves of No. 1 and 3 cylinders.

6. Turn the crankshaft one full revolution (360 degrees). Adjust the intake valves of No. 3 and 4 cylinders; the exhaust valves of No. 2 and 4 cylinders.

7. To install the components, reverse the removal procedures.

NOTE: The valves must be initially adjusted with the engine cold. After the initial engine start-up, allow the engine to reach normal operating temperature and adjust the valves to the correct hot clearances.

2F Engine

1. Operate the engine until it reaches normal operating temperatures.

2. Remove the cylinder head cover.

3. Turn the crankshaft until the No. 1 cylinder is on the TDC of the compression stroke. The valves of the No. 1 cylinder must be loose.

4. To adjust the valve clearance, loosen the adjuster locknut and turn the adjusting screw.

5. Using a feeler gauge, check and/or adjust the clearance of valve No. 1, 2, 3, 5, 7 and 9 (numbered from the front).

NOTE: The intake valve clearance is 0.008 in. (warm); the exhaust valve clearance is 0.014 in. (warm).

6. Using a wrench on the crankshaft pulley bolt, turn the crankshaft one revolution, aligning the 0 degree mark on the timing pulley with the timing pointer.

7. Adjust the clearance of valve No. 4, 6, 8, 10, 11 and 12 (numbered from the front).

8. With the adjustment complete, install the removed components by reversing the removal procedures. Check and/or adjust the timing.

3F-E, 4Y-E, 4Y-EC and 3VZ-E Engines

The valve tappets of these engines are hydraulic; no adjustment is necessary.

Intake Manifold

REMOVAL & INSTALLATION

22R Engine

1. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Remove the air cleaner assembly, complete with hoses, from the carburetor.

4. Disconnect the vacuum lines from the EGR valve and carburetor. Mark them first to aid in the installation.

5. Remove the fuel lines, electrical leads, accelerator linkage, and water hose from the carburetor.

6. Remove the water bypass hose from the manifold.

7. Unbolt and remove the intake manifold, complete with carburetor and EGR valve.

8. Cover the cylinder head ports with clean shop cloths to keep anything from falling into the cylinder head or block.

9. When installing the manifold, replace the gasket with a new one. Torque the mounting bolts to the correct torque. Tighten the bolts in several stages working from the inside bolts outward.

10. Connect the bypass line and all other lines and hoses.

11. Install the air cleaner and refill the cooling system.

22R-E and 22R-TE Engines

1. Relieve the fuel system pressure. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Disconnect the air intake hose from both the air cleaner assembly on one end and the air intake chamber on the other.

4. Tag and disconnect all vacuum lines attached to the intake chamber and manifold.

5. Tag and disconnect the wires to the cold start injector, throttle position sensor, and the water hoses from the throttle body.

6. Remove the EGR valve from the intake chamber.

7. Tag and disconnect the actuator cable, accelerator cable and throttle valve cable (if equipped) from the cable bracket on the intake chamber.

Intake manifold assembly—22R-E and 22R-TE engines

Intake manifold assembly—3VZ-E engine

8. Unbolt the air intake chamber from the intake manifold and remove the chamber with the throttle body attached.

9. Disconnect the fuel hose from the fuel delivery pipe.

10. Tag and disconnect the air valve hose from the intake manifold.

11. Make sure all hoses, lines and wires are tagged for later installation and disconnected from the intake manifold. Unbolt the manifold from the cylinder head, removing the delivery pipe and injection nozzle with the manifold.

3VZ-E Engine

1. Relieve the fuel system pressure. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Disconnect the air intake hose from both the air cleaner assembly on one end and the air intake chamber on the other.

4. Tag and disconnect all vacuum lines attached to the intake chamber and manifold.

5. Disconnect the throttle position sensor connector at the air chamber. Disconnect the PCV hose at the union.

6. Disconnect the No. 4 water bypass hose at the manifold. Remove the No. 5 bypass hose at the water bypass pipe.

7. Disconnect the cold start injector and the vacuum hose at the fuel filter.

8. Remove the union bolt and gaskets, then remove the cold start injector tube.

9. Disconnect the EGR gas temperature sensor and the EGR vacuum hoses from the air pipe and the vacuum modulator.

10. Remove the EGR valve.

11. Disconnect the No. 1 air hose at the reed valve.

12. Remove the air intake chamber and then remove the engine wire.

13. Remove the union bolts and then remove the No. 2 and 3 fuel pipes.

14. Remove the No. 4 timing belt cover. Remove the No. 2 idler pulley and the No. 3 timing belt cover.

15. Remove the fuel delivery pipes with their injectors.

16. Remove the water bypass outlet and then remove the intake manifold.

17. Install the intake manifold with new gaskets and tighten the mounting bolts to 29 ft. lbs. (39 Nm).

18. Install the water bypass outlet and tighten the 2 bolts to 13 ft. lbs. (18 Nm).

19. Install the fuel delivery pipes and injectors.

20. Install the No. 2 idler pulley. Install the No. 3 and 4 timing belt covers and tighten the bolts to 74 inch lbs. (8.3 Nm).

21. Install the fuel pipes and tighten the union bolts to 22 ft. lbs. (29 Nm).

22. Install the engine wire.

23. Install the air intake chamber and tighten the nuts and bolts to 13 ft. lbs. (18 Nm).

24. Install the EGR valve and connect all hoses and lines.

25. Install the air cleaner hose, refill the engine with coolant and connect the battery cable.

Exhaust Manifold

REMOVAL & INSTALLATION

22R, 22R-E, 22R-TE and 3VZ-E Engines

1. Remove the 3 exhaust pipe flange bolts (turbocharger flange bolts on the 22R-TE engine) and disconnect the exhaust pipe from the manifold.

2. Tag and disconnect the spark plug leads.

3. Position the spark plug wires out of the way.

4. Remove the air cleaner tube from the heat stove on carbureted engines, and remove the outer part of the heat stove.

1. Inner heat stove
2. Exhaust manifold
3. Gasket
4. Gasket
5. Outer heat stove

Exhaust manifold—22R, 22R-E and 22R-TE engines

Right exhaust manifold—3VZ-E engine

Left exhaust manifold—3VZ-E engine

5. Use a 14mm wrench to remove the manifold securing nuts.

6. Remove the manifold(s), complete with air injection tubes and the inner portion of the heat stove.

7. Separate the inner portion of the heat stove from the manifold.

8. When installing the manifold(s), tighten the retaining nuts to 29–36 ft. lbs., working from the inside out, and in several stages. Install the distributor and set the timing. Tighten the exhaust pipe flange nuts to 25–32 ft. lbs.

Combinaton Manifold

REMOVAL & INSTALLATION

2F and 3F-E Engines

1. Relieve the fuel system pressure on the 3F-E engine. Disconnect the negative battery cable. Remove the air cleaner assembly, complete with hoses.

2. Disconnect the accelerator and choke linkages, as well as the fuel and vacuum lines. Remove the throttle linkage.

3. Remove, or move aside, any of the emission control system components which are in the way.

4. Disconnect the oil filter lines and remove the oil filter assembly from the intake manifold. Unfasten the solenoid valve wire from the ignition coil terminal. Remove the EGR pipes from the exhaust gas cooler, if so equipped.

5. Unfasten the retaining bolts and remove the carburetor from the manifold. On the fuel injected engine, disconnect the throttle chamber from the manifold.

6. Loosen the manifold retaining nuts, working from the inside out, in 2 or 3 stages.

7. Remove the intake/exhaust manifold assembly from the cylinder head as a complete unit.

8. When installing the manifolds, always use new gaskets. Tighten the bolts, working from the inside out.

4Y-E and 4Y-EC Engines

1. Relieve the fuel system pressure. Disconnect the negative battery terminal from the battery. Remove the right seat and the engine service hole cover.

2. Drain the engine coolant to a level below the throttle body.

3. Remove the air cleaner-to-throttle body hose.

4. Remove the accelerator cable with the bracket from the throttle body.

5. Disconnect the air valve connector, the throttle position sensor connector and the O₂ sensor connector.

6. Disconnect the PCV hose from the air intake chamber, the water by-

Intake manifold assembly—4Y-E and 4YE-C engines

pass hoses from the throttle body, the booster vacuum hose and the charcoal canister hose, then label and disconnect the emission control hoses.

7. Remove the throttle body from the air intake chamber, the EGR tube union nut from the exhaust manifold, the EGR valve from the air intake chamber.

8. Disconnect the cold start injector tube, the water bypass hoses and the pressure regulator hose from the intake manifold.

9. Remove the air intake chamber brackets and the air intake chamber with the air valve from the intake manifold.

10. Remove the wire clamp bolt from the fuel injector rail, then, the fuel injector rail from the fuel injectors.

11. Remove the exhaust manifold-to-intake manifold bracket, the exhaust manifold-to-engine bracket, the exhaust pipe from the exhaust manifold, the fuel inlet and outlet tubes union nut from the fuel rail.

12. Remove the spark plug wires, the spark plugs and the tubes.

13. Remove the retaining bolts, then, the intake/exhaust manifolds as an assembly.

14. Clean the gasket mounting surfaces.

15. To install, use new gaskets and reverse the removal procedures. Torque the manifold-to-cylinder head bolts to 36 ft. lbs., the air intake chamber-to-intake manifold bolts to 9 ft. lbs. and the throttle body bolts to 9 ft. lbs. Refill the cooling system. Start the engine, allow it to reach operating temperatures and check for leaks.

Turbocharger

REMOVAL & INSTALLATION

22R-TE Engine

1. Disconnect the negative battery cable.

2. Drain the coolant.
3. Disconnect the oxygen sensor wire clamp and connector.
4. Disconnect the No. 1 and 3 PCV hoses.
5. Disconnect the No. 1 and 2 turbocharger water hoses.
6. Loosen the clamp on the throttle body, remove the nuts and lift off the air tube assembly.
7. Remove the No. 1 air cleaner hose assembly and the No. 2 air cleaner hose.
8. Remove the exhaust manifold and turbocharger heat insulators.
9. Disconnect the No. 3 turbocharger water hose.
10. Raise and safely support the vehicle. Disconnect the exhaust pipe from the turbine outlet.
11. Remove the turbocharger bracket stay.
12. Disconnect the turbocharger oil pipe.
13. Remove the turbocharger and exhaust manifold as an assembly.
14. Remove the No. 2 turbocharger water pipe.
15. Remove the oil pipe.
16. Remove the No. 1 water pipe.
17. Remove the turbine outlet elbow with the O₂ sensor attached.
18. Disconnect the turbocharger from the manifold.

To install:

19. Pour approximately 20cc of new oil into the oil inlet and then turn the turbocharger impeller wheel so as to wet the bearing.

20. Using a new gasket, attach the turbocharger to the manifold and tighten the nuts to 29 ft. lbs. (39 Nm).

21. Install the turbine outlet elbow and tighten the nuts to 19 ft. lbs. (25 Nm).

22. Install the No. 1 water pipe. Install the turbo oil pipe and tighten the nuts to 14 ft. lbs. (19 Nm).

23. Install the No. 2 water pipe and then mount the assembly to the cylinder head.

24. Install the oil pipe and tighten the union bolt to 20 ft. lbs. (27 Nm). Tighten the nuts to 14 ft. lbs. (19 Nm).

7. Install the turbocharger bracket stay.

25. Connect the exhaust pipe to the turbine outlet elbow and tighten the nuts to 32 ft. lbs. (43 Nm). Lower the truck.

26. Connect the No. 3 water hose and install the heat insulators.

27. Install the No. 2 air cleaner hose with the arrow facing the turbocharger and fasten the clip as shown.

28. Install the air tube assembly. Connect the O₂ sensor and clamp.

29. Refill the engine with coolant, start it and check for leaks.

Exhaust manifold and turbocharger assembly—22R-TE engine

Timing chain cover removal—3F-E engine

Timing Chain Front Cover

REMOVAL & INSTALLATION

22R, 22R-E and 22R-TE Engines

1. Disconnect the negative battery cable. Remove the cylinder head.
2. Remove the radiator.
3. Remove the alternator. Remove the oil pan.

4. On engines equipped with air pumps, unfasten the adjusting link bolts and the drive belt. Remove the hoses from the pump; remove the pump and bracket from the engine.

5. Remove the fan and water pump as a complete assembly.

NOTE: To prevent the fluid from running out of the fan coupling, do not tip the assembly over on its side.

6. Unfasten the crankshaft pulley securing bolt and remove the pulley with a suitable puller.

7. Remove the water bypass pipe.

8. Remove the fan belt adjusting bar.

9. Disconnect and remove the heater water outlet pipe. On the 22R-TE, remove the No. 3 turbocharger water pipe.

10. Remove the bolts securing the timing chain cover. Remove the cover.

To install:

11. Install the cover and tighten the 8mm bolts to 9 ft. lbs. (13 Nm). Tighten the 10mm bolts to 29 ft. lbs. (39 Nm). Apply sealer to the gaskets for both the timing chain cover and the oil pan.

12. Install the fan belt adjusting bar and tighten it to 9 ft. lbs. (13 Nm).

13. Install the heater water outlet pipe and the No. 3 turbo water hose. Install the water bypass pipe.

14. Install the crankshaft pulley and tighten the bolt to the proper torque.

15. Install the water pump and fluid coupling. Install the air conditioning compressor and then adjust the tension on all drive belts.

16. Install the oil pan. Install the radiator and then install the cylinder head.

17. Refill the engine with oil and coolant. Road test the vehicle and check for leaks.

2F and 3F-E Engines

1. Disconnect the negative battery cable and drain the coolant.

2. Disconnect the accelerator and throttle cables.

3. Remove the air intake hose, air flow meter and air cleaner as an assembly.

4. Loosen the power steering pump drive pulley nut.

5. Remove the fluid coupling with the fan and water pump pulley.

6. Remove the power steering pump and the air conditioning compressor. Remove their brackets. Remove the power steering pump idler pulley and its bracket.

7. Remove the cylinder head cover. Remove the rocker shaft assembly.

8. Remove the distributor.

9. Remove the pushrod cover and then remove the valve lifters. Be certain that they are kept in order.

10. Loosen the 6 bolts and then slide the power steering pump pulley off the crankshaft.

11. Using special tool 09213-58011 or equivalent and a 46mm socket wrench, remove the crankshaft pulley bolt. Remove the pulley.

12. Remove the oil cooler pipe and its hose.

13. Remove the timing gear cover and gasket.

To install:

14. There are 3 sizes of timing gear cover bolts. Apply adhesive to the two A bolts. Install a new gasket and then position the cover. Finger tighten all bolts. Align the crankshaft pulley set key with the groove of the pulley; gently tap the pulley onto the crankshaft. Tighten the cover bolts marked A to 18 ft. lbs. (25 Nm). Tighten those marked B or C to 43 inch lbs. (5 Nm). Tighten the pulley bolt to 253 ft. lbs. (343 Nm).

15. Position the power steering pulley on the crankshaft and tighten the bolts to 13 ft. lbs. (18 Nm).

16. Insert the valve lifters into their bores and install the pushrod cover.

Timing chain and sprockets—22R, 22R-E and 22R-TE engines

Tighten the bolts to 35 inch lbs. (4 Nm). Make sure the valve lifters are installed in the same bore that they were removed from.

17. Install the rocker shaft assembly, the cylinder head cover and the distributor.

18. Install the water pump pulley, fluid coupling and fan.

19. Install the power steering pump idler pulley and bracket. Install the power steering pump and air conditioning compressor. Adjust the drive belts.

20. Install the air cleaner assembly and then connect and adjust the accelerator and throttle cables.

21. Fill the engine with coolant and connect the battery cable. Start the engine and check for leaks. Check the ignition timing.

4Y-E and 4Y-EC Engines

1. Disconnect the negative battery terminal from the battery. Drain the cooling system.

2. If equipped with an automatic transmission, remove and plug the oil cooler lines at the radiator.

3. Remove the fan shroud, the radiator hoses, the coolant reservoir hose and the upper radiator bolt. Raise and safely support the vehicle. Remove the engine under cover, the mounting bolts and the radiator. Lower the vehicle.

4. Remove the drive belts, the fan, the fluid coupling and the water pump pulley from the water pump.

5. Using the appropriate tools, remove the crankshaft pulley center bolt. Using an appropriate puller, pull

the crankshaft pulley from the crankshaft.

6. Remove the front cover mounting bolts. Using a small pry bar, lift the front cover from the engine.

To install:

7. Using a putty knife, clean the gasket mounting surfaces.

8. Use a new gasket, sealant and reverse the removal procedures.

9. Using a soft faced hammer, drive the crankshaft pulley onto the crankshaft. Torque the crankshaft pulley bolt to 80 ft. lbs.

10. Adjust the drive belts and refill the cooling system.

11. Start the engine, allow it to reach normal operating temperatures and check for leaks.

Front Cover Oil Seal

REPLACEMENT

22R, 22R-E and 22R-TE Engines

1. Disconnect the negative battery cable. Remove the crankshaft pulley.

2. Using a small pry bar, pry the oil seal from the oil pump housing.

3. Using the appropriate seal installer, drive the new seal into the oil pump housing. Apply multi-purpose grease to the lip of the new seal.

4. To complete the installation, reverse the removal procedures.

2F and 3F-E Engines

1. Disconnect the negative battery cable. Remove the crankshaft pulley.

2. Using a small pry bar, pry the oil seal from the front cover.

3. Using the appropriate seal installer, drive the new seal into the front cover. Apply multi-purpose grease to the lip of the new seal.

4. To complete the installation, reverse the removal procedures.

4Y-E and 4Y-EC Engines

FRONT COVER REMOVED

1. Using a drift punch and a hammer, drive the oil seal from the front cover.

2. Using an appropriate seal installer and a hammer, drive the new oil seal into the front cover.

3. Apply grease to the lip of the new seal.

FRONT COVER INSTALLED

1. Disconnect the negative battery cable. Remove the crankshaft pulley.

2. Using the appropriate seal remover, pull the oil seal from the front cover.

3. Apply multi-purpose grease to the lip of the new seal.

4. Using the appropriate seal installer and a hammer, drive the new oil seal into the front cover.

5. To complete the installation, reverse the removal procedures.

Timing Chain and Tensioner

REMOVAL & INSTALLATION

22R, 22R-E and 22R-TE Engines

1. Disconnect the negative battery cable. Remove the cylinder head and timing chain cover.

2. Separate the chain from the damper and remove the chain, complete with the camshaft sprocket.

3. Remove the crankshaft sprocket and the oil pump drive with a puller.

4. Inspect the chain for wear or damage. Replace it if necessary.

5. Inspect the chain tensioner for wear. If it measures less than 11mm, replace it.

6. Check the dampers for wear. If their measurements are below the following specifications, replace them. The specification for the upper damper is 5.0mm and the lower damper is 4.5mm.

To install:

7. Rotate the crankshaft until its key is at TDC. Slide the sprocket in place over the key.

8. Place the chain over the sprocket so that its single bright link aligns with the mark on the camshaft sprocket.

9. Install the cam sprocket so that

Aligning the crankshaft gear with the single bright link of the timing chain—22R, 22R-E and 22R-TE engines

Aligning the camshaft sprocket mark between the 2 bright links of the timing chain—22R, 22R-E and 22R-TE engines

CAMSHAFT SET KEY

Aligning the timing chain and sprockets—4Y-E and 4Y-EC engines

the timing mark falls between the two bright links on the chain.

10. Fit the oil pump drive spline over the crankshaft key.

11. Install the timing cover gasket on the front of the block.

12. Rotate the camshaft sprocket counterclockwise to remove the slack from the chain.

13. Install the timing chain cover and cylinder head.

4Y-E and 4Y-EC Engines

1. Disconnect the negative battery cable. Remove the front cover.

Installing the timing chain on the sprockets—4Y-E and 4Y-EC

Aligning the timing marks—2F engine

NOTE: Using a tension gauge, measure the slack of the timing chain, it should be 0.531 in. at 22 lbs. pressure.

2. Remove the mounting bolts and the timing chain tensioner.

3. Install the crankshaft pulley on the crankshaft. Using the proper tools, secure the crankshaft pulley, remove the camshaft mounting bolt with a socket wrench and remove the crankshaft pulley.

4. Using an appropriate puller tool, uniformly remove the camshaft sprocket with the crankshaft sprocket and chain.

5. Clean the gasket mounting surfaces.

6. Upon installation, align the timing chain with the timing marks on the sprockets, then install the sprockets on their respective shafts.

7. To complete the installation, use new gaskets, sealant and reverse the removal procedures. Torque the camshaft mounting bolt to 67 ft. lbs., the timing chain tensioner bolts to 13 ft. lbs., the crankshaft pulley bolt to 80 ft. lbs. Adjust the drive belt tension and refill the cooling system. Check and/or adjust the engine timing.

Timing Gears

REMOVAL & INSTALLATION

2F and 3F-E Engines

1. Disconnect the negative battery cable. Remove the cylinder head and the front cover from the engine.

2. Remove the oil slinger from the crankshaft. Remove the camshaft thrust plate retaining bolts, by working through the holes provided in the camshaft timing gear.

3. Remove the camshaft through the front of the cylinder block. Support the camshaft while removing it, so the bearings or the lobes do not become damaged.

NOTE: The timing gear is a press-fit and cannot be removed without removing the camshaft.

4. Inspect the crankshaft timing gear. Replace it if it has worn or damaged teeth.

5. Remove the sliding key, then, pull the crankshaft timing gear from the crankshaft with a gear puller.

6. Use a large piece of pipe to drive the timing gear onto the crankshaft. Lightly and evenly tap the end of the pipe until the gear is in its original position.

To install:

7. Apply a coat of engine oil to the camshaft journals and bearings, then, insert the camshaft into the block.

8. Align the mating marks on the timing gears. Slip the camshaft into position. Torque the camshaft thrust plate bolts to 14.5 ft. lbs.

9. Using a feeler gauge, check the gear backlash, inserted between the crankshaft and the camshaft timing gears. The maximum backlash should be 0.002–0.005 in.; if it exceeds this, replace one or both of the gears, as required.

10. Using a dial indicator, check the gear run-out. Maximum run-out, for both gears, is 0.008 in.; if not, replace the gear.

11. Install the oil nozzle (if removed) by screwing it in place with a screwdriver and punching it in two places, to secure it.

NOTE: Be sure that the oil hole in the nozzle is pointed toward the timing gear before securing it.

12. To complete the installation, use new gaskets, sealant and reverse the removal procedures.

Timing Belt Front Cover

REMOVAL & INSTALLATION

3VZ-E Engine

1. Disconnect the negative battery cable and drain the coolant.
2. Remove the radiator and shroud.
3. Remove the power steering belt and pump.
4. Remove the spark plugs.
5. Disconnect the No. 2 and 3 air hoses at the air pipe.
6. Disconnect the No. 1 water bypass hose at the air pipe and then remove the water outlet.
7. Remove the air conditioning belt. Remove the alternator drive belt, fluid coupling, guide and fan pulley.
8. Disconnect the high tension cords and their clamps at the No. 2 (upper) timing belt cover and then remove the cover and its gaskets.
9. Rotate the crankshaft pulley until the groove on its lip is aligned with the 0 on the No. 1 (lower) timing belt cover, this should set the No. 1 cylinder at TDC of its compression stroke. The matchmarks on the camshaft timing pulleys must be in alignment with those on the No. 3 (upper rear) timing cover. If not, rotate the engine 360 degrees (one complete revolution).
10. Remove the crankshaft pulley using a puller.
11. Remove the fan pulley bracket and then remove the No. 1 timing belt cover.

To install:

12. Install the No. 1 cover with the 2 gaskets and tighten the bolts to 48 inch lbs. (5.4 Nm).
13. Install the fan pulley bracket and tighten it to 30 ft. lbs. (41 Nm).
14. Install the No. 2 cover and tighten the bolts 48 inch lbs. (5.4 Nm).
15. Position the crankshaft pulley so the groove in the pulley is aligned with the woodruff key in the crankshaft. Tighten the bolt to 181 ft. lbs. (245 Nm).
16. Install the fan pulley, guide, fluid coupling and alternator drive belt. Adjust the belt tension.
17. Install the power steering pump and belt. Install the air conditioning belt. Adjust the belt tension.
18. Install the water outlet and connect the bypass hose. Connect the No. 2 and 3 air hoses.
19. Install the spark plugs. Install the radiator, fill with coolant and road test the vehicle. Check for leaks and check the ignition timing.

Timing belt components - 3VZ-E engine

Timing Belt and Tensioner

REMOVAL & INSTALLATION

3VZ-E Engine

1. Disconnect the negative battery cable. Remove the timing belt covers.
2. Draw a directional arrow on the timing belt and matchmark the belt to each of the pulleys. Remove the timing belt guide and then remove the tension spring.
3. Loosen the idler pulley bolt and shift it left as far as it will go. Tighten the set bolt and relieve the tension on the timing belt. Remove the belt.
4. Remove the crankshaft and camshaft sprocket timing pulleys. Remove the No. 1 idler pulley.
5. Align the groove in the crankshaft pulley with the key on the crankshaft and press the pulley onto the shaft.
6. Install the idler pulley. Align the groove on the pulley with the cavity of the oil pump and then force it to the left as far as it will go. Temporarily tighten it to 27 ft. lbs. (37 Nm).
7. Position the camshaft pulleys on the camshafts so the match holes in each pulley are in alignment with those on the No. 3 (upper rear) timing cover. Align the pulley matchmark with the one on the cover.

NOTE: Do not install the match pin. Check that the bolt head is not touching the pulley.

8. Install the timing belt around the timing pulleys. If reusing the old belt, make sure the arrow and matchmarks all line up with those made earlier on the pulleys.

Aligning the timing marks with the rear cover - 3VZ-E engine

Installing the timing belt - 3VZ-E engine

Rechecking the sprocket alignment - 3VZ-E engine

9. Move the idler pulley to the right as far as it will go. Install the tension spring and then loosen the pulley bolt until the pulley moves lightly with the tension spring force.

10. Check the valve timing and belt tension by turning the crankshaft 2 complete revolutions clockwise. Check that each pulley aligns with its timing marks. Retighten the idler pulley bolt to 27 ft. lbs. (37 Nm).

11. Remove the camshaft timing pulley bolts and align the match pin hole with the match pin hole in the camshaft. Install the pin and bolt and tighten to 80 ft. lbs. (108 Nm).

12. Remove the crankshaft timing pulley bolt and position the belt guide over the crankshaft pulley so the cupped side is out.

13. Install the timing covers. Connect the negative battery cable.

Camshaft

REMOVAL & INSTALLATION

22R, 22R-E and 22R-TE Engines

1. Disconnect the negative battery cable. Remove the cylinder head cover.

2. Remove the rocker arm assembly from the cylinder head.

NOTE: It may be necessary to use a small pry bar to lift the rocker arm assembly from the cylinder head.

3. Using a feeler gauge, measure the thrust bearing clearance at the front of the camshaft; the standard clearance is 0.003–0.007 in., it should not exceed 0.0098 in.

4. Remove the camshaft bearing caps and lift out the camshaft. Keep the bearings in order so that they may be installed in their original position.

5. Check the camshaft journal caps for damage. Clean all of the bearing surfaces, including the caps, cam journal and the cylinder head.

To install:

6. With the camshaft in place on the cylinder head, lay small strips of plastigage® on each of the camshaft journals (at the tops of the journals, facing front-to-rear).

7. Reinstall the journal caps in their original locations (arrows facing forward) and torque the caps to 13–16 ft. lbs.

8. Remove the journal caps and gauge the width of the plastigage® against the chart on the plastigage® package. Maximum journal clearance is 0.004 in. If the journal clearance is greater than specified, measure the cam journal diameters with a micrometer. If the diameter of any cam journal is less than specified, obtain a new camshaft and recheck the journal clearance. If the clearance is still excessive, the cylinder head must be replaced.

9. To complete the installation, use new gaskets, sealant and reverse the removal procedures. Refill the cooling system. Torque the camshaft bearing cap bolts to 14 ft. lbs., the cylinder head-to-engine block to 58 ft. lbs., the timing chain cover-to-cylinder head bolt to 9 ft. lbs., the camshaft sprocket-to-camshaft bolt to 58 ft. lbs., the intake manifold bolts to 14 ft. lbs., the exhaust manifold bolts to 33 ft. lbs. and the rocker arm cover to 7–12 ft. lbs. Replace the cooling system fluid and the engine oil. Adjust the valves, the drive belts, then, check and/or adjust the timing.

NOTE: If a new cam is installed, use an assembly lube on the cam lobes and engine oil on the journals. Change the engine oil and filter.

2F and 3F-E Engines

1. Disconnect the negative battery cable. Remove the cylinder head and the front cover from the engine.

2. Remove the oil slinger from the crankshaft. Remove the camshaft thrust plate retaining bolts, by working through the holes provided in the camshaft timing gear.

3. Remove the camshaft through the front of the cylinder block. Support the camshaft while removing it, so the bearings or the lobes do not become damaged.

4. Inspect the crankshaft timing gear. Replace it if it has worn or damaged teeth.

5. Remove the sliding key, then, pull the crankshaft timing gear from the crankshaft with a gear puller.

6. Use a large piece of pipe to drive the timing gear onto the crankshaft. Lightly and evenly tap the end of the pipe until the gear is in its original position.

To install:

7. Apply a coat of engine oil to the camshaft journals and bearings, then, insert the camshaft into the block.

8. Align the mating marks on the timing gears. Slip the camshaft into position. Torque the camshaft thrust plate bolts to 14.5 ft. lbs.

9. Using a feeler gauge, check the gear backlash, inserted between the crankshaft and the camshaft timing gears. The maximum backlash should be 0.002–0.005 in.; if it exceeds this, replace one or both of the gears, as required.

10. Using a dial indicator, check the gear run-out. Maximum run-out, for both gears, is 0.008 in.; if not, replace the gear.

11. Install the oil nozzle (if removed) by screwing it in place and punching it in 2 places, to secure it.

NOTE: Be sure that the oil hole in the nozzle is pointed toward the timing gear before securing it.

12. To complete the installation, use new gaskets, sealant and reverse the removal procedures.

4Y-E and 4Y-EC Engines

1. Disconnect the negative battery cable. Remove the timing chain from the engine.

2. Remove the right-front seat, the service hole cover and the distributor.

3. Disconnect the cold start injector connector, place a shop towel under the injector tube, then, remove the cold start injector union bolts, the injector and the gaskets. Remove the valve cover, the mounting bolts and the rocker arm assembly.

4. Remove the pushrods, keeping them in order. Using a wire hook or a magnetic finger, remove the valve lifters, keeping them in order.

5. Remove the thrust plate mounting bolts and the plate.

6. While turning the camshaft, slowly pull it out through the front of the engine, making sure not to damage the bearings, the camshaft lobes or the camshaft bearing surfaces.

To install:

7. Install the thrust plate, the camshaft sprocket and bolt onto the camshaft. Using a feeler gauge, measure the thrust bearing clearance, it should be 0.0028–0.0087 in.; if the clearance exceeds 0.012 in., replace the thrust plate.

8. Using a micrometer, check the bearing diameters of the camshaft. Using an internal micrometer, check the camshaft bearing diameters on the engine block.

9. Clean the gasket surfaces.

NOTE: Before installing the valve lifters, coat them with oil.

10. Use new gaskets, sealant and reverse the removal procedures. Torque the camshaft thrust bearing plate bolts to 13 ft. lbs., the camshaft sprocket bolt to 67 ft. lbs., the timing chain tensioner bolts to 13 ft. lbs. and

Removing the camshaft bearing bolts

Piston and Connecting Rod

POSITIONING

Piston and connecting rod positioning—22R, 22R-E and 22R-TE, 2F, 3F-E, 4Y-E and 4YE-C engines

Piston and connecting rod positioning—3VZ-E engine

the crankshaft pulley bolt to 80 ft. lbs. Adjust the drive belts and refill the cooling system. Check and/or adjust the timing.

3VZ-E Engine

1. Disconnect the negative battery cable.
2. Remove the timing belt covers and remove the timing belt.
3. Disconnect all wires and hoses to the air intake chamber.
4. Remove the bolts retraining the air intake chamber and remove the air intake chamber from the intake manifold.
5. Remove the rear timing belt cover.
6. Remove the idler pulley and timing cover.
7. Remove the fuel rail and injectors from the intake manifold.
8. Remove the cylinder head cover.

9. Remove the camshaft housing rear cover. Loosen the camshaft retaining bolts a little at a time in the correct sequence.

10. Remove the camshaft from the cylinder head.

11. Installation is the reverse of the removal procedure. When installing the bearing caps, make sure the arrow faces the front of the engine. Torque the caps to 12 ft. lbs. (16 Nm) in the correct sequence.

ENGINE LUBRICATION

Oil Pan

REMOVAL & INSTALLATION

Pick-Up, Van and 4Runner

1. Raise the hood and disconnect the negative battery cable.
2. Raise and safely support the vehicle.
3. Drain the engine oil.
4. Remove the steering relay rod and the tie rods from the idler arm, pitman arm, and steering knuckles.
5. Remove the engine stiffening plates.
6. Remove the splash pans from under the engine.
7. Position a floor jack under the transmission and raise the engine/transmission assembly slightly.
8. Remove the front motor mount attaching bolts.
9. Remove the oil pan bolts and remove the oil pan.
10. Scrape the cylinder block and oil pan mating surfaces clean of any old sealing material. Apply gasket sealer to the oil pan when installing a new gasket. On vehicles with the 22R, 22R-E, 22R-TE, 4Y-E and 4Y-EC engines, apply 5mm bead of gasket sealer; on vehicles with the 2F, 3F-E and 3VZ-E engine, use 3mm bead. The parts should be installed within 5 minutes of applying the sealer.
11. The oil pan bolts should be tightened to 9 ft. lbs. on the 22R, 22R-E, 22R-TE, 4Y-E and 4Y-EC engines; 6 ft. lbs. (bolt), 52 inch lbs. on the 2F, 3F-E and 3V-ZE engines. Tighten the bolts in a circular pattern, starting in the middle of the pan and working out towards the ends.
12. Lower the engine and tighten the motor mount bolts. Install the splash shields and stiffening plates.
13. Install any steering arms re-

moved in Step 4 and then lower the vehicle; tighten all suspension components and the motor mounts to their final torque with the vehicle resting on the ground.

14. Fill the engine with oil, road test the vehicle and check for leaks.

Land Cruiser

1. Raise and safely support the vehicle. Remove the engine skid plates.
2. Remove the flywheel side cover and skid plate.
3. Disconnect the front driveshaft from the engine.
4. Drain the engine oil.
5. Remove the bolts which secure the oil pan. Remove the pan and its gasket.
6. Scrape away any old gasket material and then apply gasket sealer to the cylinder block mating surface and the No. 1 and No. 4 main bearing caps.
7. Install the oil pan and tighten the bolts to 69 inch lbs. (7.8 Nm). Always use a new pan gasket.
8. Connect the driveshaft, skid plate and flywheel side cover.
9. Lower the vehicle, fill the engine with oil and check for any leaks.

Oil Pump

REMOVAL & INSTALLATION

22R, 22R-E and 22R-TE Engines

1. Raise and safely support the vehicle. Drain the oil, and remove the oil pan and the oil strainer and pick-up tube.
2. Remove the drive belts from the crankshaft pulley.
3. Remove the crankshaft bolt, and remove the pulley with a gear puller.
4. Remove the 5 bolts from the oil pump and remove the oil pump assembly.
5. Inspect the drive spline, driven gear, pump body, and timing chain cover for excessive wear or damage. If necessary, replace the gears or pump body or cover. Unbolt the relief valve (the vertical bolt on the pump body) when attached to the engine) and check the pistons, oil passages, and sliding surfaces for burrs or scoring. Inspect the crankshaft front oil seal and replace if worn or damaged.
6. When installing, use a new O-ring if necessary.
7. Apply a sealer to the upper bolt and install the 5 bolts.
8. Install the crankshaft pulley and use a new gasket on the oil strainer and oil pan. Be sure to apply sealer to the corners of the oil pan gasket before installing the pan.

2F and 3F-E Engines

1. Disconnect the negative battery cable. Raise and safely support the vehicle. Remove the oil pan.

2. Remove the oil strainer and unfasten the union nuts on the oil pump pipe.

3. Remove the lock wire and the oil pump retaining bolt and pipe from the engine.

4. Remove the oil pump cover and inspect the following parts for nicks, scoring, grooving, etc.:

- pump cover
- drive and driven gears
- pump body

5. Replace either the damaged parts or the complete pump if damage is excessive.

To install:

6. Install the oil pump so that the slot in the oil pump shaft is in alignment with the protrusion on the governor shaft of the distributor. Tighten the mounting bolts to 13 ft. lbs. (18 Nm).

7. Install the outlet pipe and tighten the union bolt to 33 ft. lbs. (44 Nm); use new gaskets.

8. Install the oil pan, fill the engine with oil and check for leaks.

NOTE: Be sure to check all of the gaskets and replace if necessary.

4Y-E and 4Y-EC Engines

1. Disconnect the negative battery cable. Raise and safely support the vehicle. Remove the oil pan.

2. Remove the oil pump mounting bolts, then pull out the pump assembly.

3. Using a putty knife, clean the gasket mounting surfaces.

4. To install, use new gaskets, sealant and reverse the removal procedures. Torque the oil pump bolts to 13 ft. lbs.

3VZ-E Engine

1. Disconnect the negative battery cable.

2. Remove the timing belt.

3. Raise and safely support the vehicle. Remove the engine under cover.

4. Remove the front differential.

5. Drain the oil.

6. Remove the crankshaft timing pulley.

7. Raise the engine slightly and remove the oil pan.

8. Remove the oil strainer. Insert a drift between the cylinder block and the oil pan baffle plate, cut off the sealer and remove the baffle plate.

NOTE: When removing the baffle plate with the drift, do not damage the baffle plate flange.

9. Remove the oil pump and O-ring.

To install:

10. Apply sealer to the oil pump mating surface running the bead on the inside of the bolts holes. Position a new O-ring in the groove in the cylinder block and install the pump so that the spline teeth of the drive gear engage the large teeth on the crankshaft. Tighten the mounting bolts to 14 ft. lbs. (20 Nm).

11. Remove any old sealer and install the baffle plate with new sealer.

12. Install the oil strainer and tighten the bolts to 61 inch lbs. (7 Nm).

13. Install the oil pan, crankshaft pulley and the timing belt.

14. Install the front differential and the undercovers.

15. Fill the engine with oil and check for leaks.

Rear Main Bearing Oil Seal**REMOVAL & INSTALLATION****22R, 22R-E and 22R-TE Engines**

1. Raise and safely support the vehicle. Remove the transmission and the clutch assembly (if equipped). Remove the transfer case, if equipped.

2. Remove the flywheel or the flex plate from the crankshaft. Remove the cover plate from the rear of the engine.

3. Remove oil pan-to-oil seal retaining plate bolts, the oil seal retaining plate-to-engine bolts and oil seal retaining plate.

4. Carefully pry or drive the old seal

from the retaining plate. Be careful not to damage the retaining plate.

5. Using an oil seal driver tool, drive the new seal into the oil seal retaining plate, until the surface is flush.

6. Lubricate the lips of the seal with multipurpose grease.

7. Clean the gasket mounting surfaces.

8. To install, use new gaskets and reverse the removal procedures. Adjust the clutch.

2F and 3F-E Engines

1. Raise and safely support the vehicle. Remove the transfer case, the transmission and the clutch assembly.

2. Remove the flywheel from the crankshaft.

3. Using a small pry bar, carefully pry the oil seal from the rear of the crankshaft.

4. Lubricate the lips of the seal with multipurpose grease.

5. Using an oil seal driver tool, drive the new seal into the rear of the crankshaft.

6. Clean the gasket mounting surfaces.

Oil pump assembly—22R, 22R-E and 22R-TE engines

Oil pan and pump assembly—3VZ-E engine

7. To install, reverse the removal procedures. Adjust the clutch.

4Y-E, 4Y-EC and 3VZ-E Engines

1. Raise and safely support the vehicle. Remove the transmission and the clutch assembly (if equipped). Remove the transfer case, if equipped.

2. Remove the flywheel or the flex plate from the crankshaft. Remove the cover plate from the rear of the engine.

3. To replace the oil seal with the retaining plate removed:

a. Remove oil pan-to-oil seal retaining plate bolts, the oil seal retaining plate-to-engine bolts and oil seal retaining plate.

b. Carefully pry or drive the old seal from the retaining plate. Be careful not to damage the retaining plate.

c. Using an oil seal driver tool, drive the new seal into the oil seal retaining plate, until the surface is flush.

d. Lubricate the lips of the seal with multipurpose grease.

4. To replace the oil seal with the retaining plate installed:

a. Cut off the oil seal lip.

b. Using a small pry bar, pry the oil seal from the retaining plate.

c. Apply multi-purpose grease to the new oil seal.

d. Using an oil seal driver tool, drive the new seal into the oil seal retaining plate until the surface is flush.

5. Clean the gasket mounting surfaces.

6. To complete the installation, reverse the removal procedures. Adjust the clutch.

a. Remove the center floor console, if equipped.

b. Remove the shift lever handle, then the floor mat or carpet along with the shift lever boot in order to gain access to the shift lever.

c. Using an shift lever removal tool, remove the shift lever.

NOTE: On the Pick-Up, remove the boot and the shift lever from inside the vehicle.

3. Raise and safely support the vehicle. Drain the transmission fluid.

4. Make matchmarks on the driveshaft flange and the differential pinion flange to indicate their relationships; these marks must be aligned during installation.

5. Remove the driveshaft flange bolts and the center support bearing-to-frame bolts (if equipped with a 2-piece driveshaft). Lower the driveshaft out of the vehicle. Using an appropriate tool, insert it into the end of the transmission to prevent oil leakage.

6. On the Van, disconnect the shift and the select cables from the select outer levers, the clips and the cables.

7. Disconnect the back-up lamp switch electrical connector and the speedometer cable from the transmission, then tie the cable out of the way.

8. Disconnect the wiring at the starter. Remove the starter mounting bolts and lower the starter out of the vehicle.

9. Remove the exhaust pipe clamp and the exhaust pipe.

10. If the hydraulic line from the clutch release cylinder is clamped to the frame, remove the clamp retaining bolt. Remove the release cylinder mounting bolts and the fork spring (if equipped). Tie the release cylinder out of the way.

NOTE: It is not necessary to disconnect the hydraulic line from the release cylinder.

11. On column shift vehicles, disconnect the shift selector linkage at the transmission and remove the transmission cross shafts.

12. Support the rear of the transmission with a jack and remove the transmission-to-crossmember bolts, the crossmember-to-frame bolts and the crossmember from the vehicle.

NOTE: When removing the crossmember, raise the rear of the transmission, just enough to take the weight off of the crossmember.

13. Place a support under the engine with a wooden block (¾ in. thick) between the support and the engine oil pan.

NOTE: The wooden block and support should be no more than about ¼ in. away from the engine so that when the engine is lowered, damage will not occur to any underhood components. If possible, shim the support so that the wooden block touches the engine.

14. Remove the transmission-to-engine bolts, draw the transmission rearward and down, away from the engine.

To install:

15. Raise the transmission into position under the vehicle.

16. Install the transmission-to-engine bolts.

17. Torque transmission-to-engine bolts to 53 ft. lbs., the stiffener plate bolts to 27 ft. lbs., the transmission mount/bracket bolts to 19 ft. lbs., the rear engine mount bracket-to-crossmember bolts to 9 ft. lbs.

18. Connect the exhaust pipes and brackets. Install the starter and the clutch release cylinder.

19. Tighten the exhaust pipe-to-manifold bolts to 29 ft. lbs., the upper exhaust pipe bracket-to-clutch housing bolts to 27 ft. lbs., the lower exhaust pipe bracket-to-clutch housing bolts to 51 ft. lbs., the lower starter bolt/release cylinder tube bracket bolt to 29 ft. lbs., the clutch release cylinder bolts to 9 ft. lbs.

20. Connect the remaining linkages and connect the driveshaft, aligning the matchmarks made during removal.

21. Refill the transmission to the correct level.

22. Install the shift lever and the center console.

23. Connect the negative battery cable.

4WD Pick-Up and 4Runner

1. Disconnect the negative battery terminal. Remove the starter upper mounting bolt.

2. Working inside the vehicle, pull up the shift lever boot and pull out the shift lever. If equipped with a 22R-E engine, pull up the shift lever boot, then, remove the mounting bolts and pull out the shift lever.

3. Using needle nose pliers, remove the transfer case shift lever snapping and the shift lever.

4. Raise and safely support the vehicle.

5. Drain the lubricant from both the transmission and the transfer case.

6. Make matchmarks on the driveshaft flanges and the differential pinion flanges to indicate their relationships. These marks must be aligned during installation.

MANUAL TRANSMISSION

Transmission Assembly

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

REMOVAL & INSTALLATION

2WD Pick-Up and Van

1. Disconnect the negative battery terminal.

2. Perform the following:

7. Remove the driveshaft mounting bolts and remove the front driveshaft assembly.

NOTE: Do not disassemble the front driveshaft to remove it.

8. Using a piece of chalk, place matchmarks on the rear driveshaft and the slip yoke to indicate their relationships; these marks must be aligned during installation.

9. Remove the mounting bolts from the rearward flange of the rear driveshaft. Lower the driveshaft out of the vehicle. Remove the mounting bolts from the slip yoke flange, then, remove the flange and yoke assembly.

10. Unbolt the clutch release cylinder and tie it out of the way.

NOTE: It is not necessary to disconnect the hydraulic line from the clutch release cylinder.

11. Disconnect the starter motor electrical connectors. Remove the starter bolts and lower the starter from the vehicle.

12. At the transfer case, disconnect the speedometer cable (tie it out of the way), the back-up light switch connector and the 4WD indicator switch connector.

13. Disconnect the exhaust pipe clamp and the exhaust pipe from the transmission housing.

14. Remove the clutch release cylinder and the tube bracket, then, move the cylinder aside.

NOTE: When removing the clutch release cylinder, do not disassemble the hydraulic line from the cylinder.

15. Remove the crossmember-to-transfer case mounting bolts. Using a jack, raise the transmission and transfer case assembly off of the crossmember. Remove the crossmember-to-frame attaching bolts and remove the crossmember.

16. Place a support under the engine oil pan, with a wooden block ($\frac{3}{4}$ in. thick) between the support and the engine oil pan.

NOTE: The wooden block and support should be no more than about $\frac{1}{4}$ in. away from the engine so that when the engine is lowered, damage will not occur to any underhood components. If possible, shim the support so that the wooden block touches the engine.

17. Lower the jack until the engine rests on the support.

18. Remove the exhaust pipe bracket and the stiffener plate bolts.

19. Remove the transmission-to-engine bolts, draw the transmission/

transfer case assembly rearward and down away from the engine.

20. Remove the transmission-to-transfer case adapter bolts and pull the transfer case from the transmission.

To install:

21. Raise the transmission into position under the vehicle.

22. Install the transmission-to-engine bolts.

23. Torque transmission-to-engine bolts to 53 ft. lbs., the stiffener plate bolts to 27 ft. lbs., the transmission mount/bracket bolts to 19 ft. lbs., the rear engine mount bracket-to-crossmember bolts to 9 ft. lbs.

24. Connect the exhaust pipes and brackets. Install the starter and the clutch release cylinder.

25. Tighten the exhaust pipe-to-manifold bolts to 29 ft. lbs., the upper exhaust pipe bracket-to-clutch housing bolts to 27 ft. lbs., the lower exhaust pipe bracket-to-clutch housing bolts to 51 ft. lbs., the lower starter bolt/release cylinder tube bracket bolt to 29 ft. lbs., the clutch release cylinder bolts to 9 ft. lbs.

26. Connect the remaining linkages and connect the driveshaft, aligning the matchmarks made during removal.

27. Refill the transmission to the correct level.

28. Install the shift lever and the center console.

29. Connect the negative battery cable.

Land Cruiser

1. Disconnect the negative battery terminal from the battery.

2. Remove the entrance scuff plates from the floor of the interior.

3. Remove both side trim panels from beneath the instrument panel.

4. Remove the center heater duct and the front floor mat or carpet.

5. Remove the handles from both shift levers and the transmission tunnel cover along with the shift lever boots.

6. Disconnect the wiring from both the back-up lamp switch and the 4WD indicator (if equipped).

7. Remove the transmission shift lever.

8. Raise and safely support the vehicle. Remove the transfer case skid plate.

9. Disconnect the speedometer cable from the transfer case and tie it out of the way.

10. Using chalk, place matchmarks on the driveshaft flanges and the differential pinion flanges to indicate their relationships; these marks must be aligned during installation.

11. Remove the driveshaft flanges

mounting bolts and the driveshaft assemblies.

12. Disconnect the starter electrical connectors, the mounting bolts and the starter from the vehicle.

13. Remove the clutch release cylinder and move it out of the way.

NOTE: It is not necessary to disconnect the hydraulic line from the release cylinder.

14. Drain the lubricant from both the transmission and the transfer case. Remove the tachometer sensor, if equipped.

15. Remove the crossmember-to-transfer case mounting bolts. Using a jack, raise the transmission and transfer case assembly off the crossmember. Remove the crossmember-to-frame attaching bolts and the crossmember.

16. Place a support under the engine oil pan, with a wooden block ($\frac{3}{4}$ in. thick) between the support and the engine oil pan.

17. Lower the jack until the engine rests on the support.

NOTE: For the next step, it is recommended that an assistant help guide the transmission and transfer case assembly out of the vehicle.

18. Remove the exhaust pipe bracket and the stiffener plate bolts.

19. Remove the transmission-to-engine bolts, then, draw the transmission/transfer case assembly rearward and down away from the engine.

20. To separate the transfer case from the transmission, remove the transfer case mounting bolts and slide the transfer case off the transmission.

To install:

21. Raise the transmission into position under the vehicle.

22. Install the transmission-to-engine bolts.

23. Torque transmission-to-engine bolts to 53 ft. lbs., the stiffener plate bolts to 27 ft. lbs., the transmission mount/bracket bolts to 19 ft. lbs., the rear engine mount bracket-to-crossmember bolts to 9 ft. lbs.

24. Connect the exhaust pipes and brackets. Install the starter and the clutch release cylinder.

25. Tighten the exhaust pipe-to-manifold bolts to 29 ft. lbs., the upper exhaust pipe bracket-to-clutch housing bolts to 27 ft. lbs., the lower exhaust pipe bracket-to-clutch housing bolts to 53 ft. lbs., the lower starter bolt/release cylinder tube bracket bolt to 29 ft. lbs., the clutch release cylinder bolts to 9 ft. lbs.

26. Connect the remaining linkages and connect the driveshaft, aligning

the matchmarks made during removal.

27. Refill the transmission to the correct level.

28. Install the shift lever and the center console.

29. Connect the negative battery cable.

CLUTCH

Clutch Assembly

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the transmission from the vehicle.

2. Make matchmarks on the clutch cover and flywheel, indicating their relationship.

3. Loosen the clutch cover-to-flywheel retaining bolts a turn at a time. The pressure on the clutch disc must be released gradually.

4. Remove the clutch cover-to-flywheel bolts. Remove the clutch cover and the clutch disc.

5. If the clutch release bearing is to be replaced, perform the following:

a. Remove the bearing retaining clip(s), the bearing and hub.

b. Remove the release fork and the boot.

c. The bearing is press fitted to the hub.

d. Clean all parts and lightly grease the input shaft splines and all of the contact points.

e. Install the bearing/hub assembly, the fork, the boot and the retaining clip(s) in their original locations.

To install:

6. Inspect the flywheel surface for cracks, heat scoring (blue marks) and warpage.

NOTE: Before installing any new parts, make sure that they are clean. During installation, do not get grease or oil on any of the components, as this will shorten clutch life considerably.

7. Using an clutch alignment tool, position the clutch disc against the flywheel. (Pick-Up and Vans: The short side of the splined section faces the flywheel; Land Cruiser: The long side of the splined section faces the flywheel).

8. Install the clutch cover over the disc and install the bolts loosely. Align the pressure plate-to-flywheel matchmarks. If a new or rebuilt clutch cover assembly is installed, use the

matchmark on the old cover assembly as a reference. Torque the pressure plate-to-flywheel bolts to 14 ft. lbs. (using a criss-cross pattern).

9. Install the transmission into the vehicle.

PEDAL HEIGHT ADJUSTMENT

The pedal height measurement is gauged from the angled section of the floorboard to the center of the clutch pedal pad. The correct pedal height is 7.7 in. for Land Cruiser, 6.7-7.3 in. for Van and 6.12 for Pick-Up and 4Runner.

If necessary, adjust the pedal height by loosening the locknut and turning the pedal stop bolt which is located above the pedal towards the drivers seat. Tighten the locknut after the adjustment.

Clutch Master Cylinder

REMOVAL & INSTALLATION

Pick-Up, 4Runner and Land Cruiser

1. Disconnect the negative battery cable. Disconnect the master cylinder pushrod pin from the top of the clutch pedal.

2. Remove the hydraulic line from the master cylinder, being careful not to damage the compression fitting.

3. Remove the master cylinder-to-cowl nuts/ bolts.

4. To install, reverse the removal procedures. Partially tighten the hydraulic line before tightening the master cylinder mounting nut(s). Torque the nuts/bolts to 9 ft. lbs. Bleed the clutch system. Adjust the push rod play clearance.

Clutch pedal adjustment points

Van

1. Disconnect the negative battery terminal from the battery.

2. Remove the reservoir cap from the cluster finish panel, the mounting screws, then, pull the cluster finish panel forward and remove it.

3. Remove the mounting screws and pull the instrument panel forward, then, disconnect the speedometer and the electrical connectors from it.

4. Remove the No. 3, the No. 1 and the No. 2 air ducts.

5. Disconnect and plug the reservoir hose at the master cylinder. Disconnect the clutch line union.

6. Remove the mounting bolts and the master cylinder.

7. To install, reverse the removal procedures. Bleed the clutch system. Adjust the clutch pedal.

ADJUSTMENT

Pushrod

The pedal pushrod play is the distance between the clutch master cylinder piston and the pedal pushrod located above the pedal towards the firewall. Since it is nearly impossible to measure this distance at the source, it must be measured at the pedal pad, preferably with a dial indicator gauge. The push rod play specification is: 0.040-0.200 for Land Cruiser, 0.039-0.197 for Vans, Pick-Ups and 4Runner.

If necessary, adjust the pedal play by loosening the pedal pushrod locknut and turning the pushrod. Tighten the locknut after the adjustment.

Free Play

The free play measurement is the total travel of the clutch pedal from the fully released position to where resistance is felt as the pedal is pushed downward. The free play specification is: 0.20-0.59 for all vehicles.

Clutch Slave Cylinder

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. If equipped, remove the tension spring on the clutch fork.

3. Remove the hydraulic line from the release cylinder. Be careful not to damage the fitting.

4. Turn the release cylinder pushrod in sufficiently to gain clearance from the fork.

5. Remove the mounting bolts and withdraw the cylinder.

6. To install, reverse the removal

procedures. Bleed the clutch system. Adjust the fork tip clearance.

BLEEDING THE HYDRAULIC CLUTCH SYSTEM

1. Fill the master cylinder reservoir with brake fluid.

2. Remove the cap and loosen the bleeder screw on the clutch release cylinder. Cover the hole with a finger.

3. Pump the clutch pedal several times. Take the finger off the hole while the pedal is being depressed so that the air in the system can be released. Put a finger back on the hole and release the pedal.

4. When fluid pressure can be felt tighten the bleeder screw.

5. Place a short length of hose over the bleeder screw and the other end in a jar half full of clean brake fluid.

6. Depress the clutch pedal and loosen the bleeder screw. Allow the fluid to flow into the jar.

7. Tighten the plug, then release the clutch pedal.

8. Repeat this procedure until no air bubbles are visible in the bleeder tube.

9. When there are no more air bubbles in the system, tighten the plug fully with the pedal depressed. Replace the plastic cap.

10. Refill the master cylinder to the correct level with brake fluid. Check the system for leaks.

equipped, disconnect the solenoid (overdrive) switch wiring at the same location.

5. Disconnect the starter wiring at the starter. Remove the mounting bolts and the starter from the engine.

6. Make matchmarks on the rear driveshaft flange and the differential pinion flange. These marks must be aligned during installation.

7. Unbolt the rear driveshaft flange. If the vehicle has a 2 piece driveshaft, remove the center bearing bracket-to-frame bolts. Remove the driveshaft from the vehicle.

8. Disconnect the speedometer cable (tie it out of the way) and the shift linkage from the transmission.

9. Disconnect the transmission oil cooler lines at the transmission.

10. Disconnect the exhaust pipe clamp and remove the oil filler tube.

11. Support the transmission, using a jack with a wooden block placed between the jack and the transmission pan. Raise the transmission, just enough to take the weight off of the rear mount.

12. On the Pick-Up and 4Runner, remove the rear engine mount with the bracket and the engine under cover, to gain access to the engine crankshaft pulley. On the Van, remove the fuel tank mounting bolts and support the fuel tank; remove the transmission mount through bolt.

13. Place a wooden block (or blocks) between the engine oil pan and the front frame crossmember.

14. Slowly, lower the transmission until the engine rests on the wooden block.

15. Remove the rubber plug(s) from the service holes located at the rear of the engine in order to gain access to the torque converter bolts.

16. Rotate the crankshaft (to remove the torque converter bolts) to access the bolts through the service holes.

17. Obtain a bolt of the same dimensions as the torque converter bolts. Cut the head off of the bolt and hack-saw a slot in the bolt opposite the threaded end.

NOTE: This modified bolt is used as a guide pin. Two guides pins are needed to properly install the transmission.

18. Thread the guide pin into one of the torque converter bolt holes. The guide pin will help keep the converter with the transmission.

19. Remove the stiffener plates from the transmission.

20. Remove the transmission-to-engine bolts, then carefully move the transmission rearward by prying on the guide pin through the service hole.

21. Pull the transmission rearward

and lower it (front end down) out of the vehicle.

To install:

22. Apply a coat of multi-purpose grease to the torque converter stub shaft and the corresponding pilot hole in the flywheel.

23. Install the torque converter into the front of the transmission. Push inward on the torque converter while rotating it to completely couple the torque converter to the transmission.

24. To make sure that the converter is properly installed, measure the distance between the torque converter mounting lugs and the front mounting face of the transmission. The proper distance is 0.080 in.

25. Install guide pins into two opposite mounting lugs of the torque converter.

26. Raise the transmission to the engine, align the transmission with the engine alignment dowels and position the converter guide pins into the mounting holes of the flywheel.

27. Install and tighten the transmission-to-engine mounting bolts. Torque the bolts to 47 ft. lbs.

28. Remove the converter guide pins and install the converter mounting bolts. Rotate the crankshaft as necessary to gain access to the guide pins and bolts through the service holes. Evenly, tighten the converter mounting bolts to 13 ft. lbs. Install the rubber plugs into the access holes.

29. Install the engine undercover. Raise the transmission slightly and remove the wood block(s) from beneath the engine oil pan.

30. Install the transmission crossmember. Torque the crossmember-to-frame bolts to 26-36 ft. lbs.

31. Lower the transmission onto the crossmember and install the transmission mounting bolts. Torque the bolts to 19 ft. lbs.

32. Install the oil filler tube and connect the exhaust pipe clamp.

33. Connect the oil cooler lines to the transmission and torque the fittings to 25 ft. lbs.

34. To complete the installation, reverse the removal procedures. Adjust the transmission throttle cable. Refill the transmission with Dexron®II fluid. Road test the vehicle and check for leaks.

SHIFT LINKAGE ADJUSTMENT

1. Loosen the adjustment nut on the transmission shift cable.

2. Push the manual lever of the transmission fully rearward.

3. Move the manual lever back 2 notches, which is the N position.

AUTOMATIC TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transmission Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery terminal from the battery. On the Pick-Up and 4Runner, remove the air cleaner assembly.

2. Disconnect the transmission throttle cable from the carburetor linkage or the throttle body.

3. Raise and safely support the vehicle. Drain the transmission fluid.

4. Disconnect the wiring connectors (near the starter) for the neutral start switch and the back-up light switch. If

4. Set the gearshift selector lever in the N position.

5. Apply a slight amount of forward pressure on the selector lever and tighten the shift cable adjustment nut.

THROTTLE LINKAGE ADJUSTMENT

1. Remove the air cleaner assembly.
2. Push the accelerator to the floor and check that the throttle valve opens fully; if not, adjust the accelerator link, so that it does.

3. Push back the rubber boot from the throttle cable which runs down to the transmission. Loosen the throttle cable adjustment nuts so that the cable housing can be adjusted.

4. Fully open the carburetor throttle by pressing the accelerator all the way to the floor.

5. Adjust the cable housing so that, with the throttle wide open, the distance between the outer cable end rubber cap to the inner cable stopper is 0-0.04 in.

6. Tighten the nuts and double check the adjustment. Install the rubber boot and the air cleaner.

NEUTRAL START SWITCH ADJUSTMENT

The neutral safety switch prevents the vehicle from starting unless the gearshift selector is in either the P or N positions. If the vehicle will start in these positions, adjustment of the switch is required.

1. Loosen the neutral start switch bolt.

2. Place the selector lever in the N position.

3. Disconnect the wires from the neutral start switch.

4. Connect an ohmmeter between the terminals of the switch.

5. Adjust the switch until there is continuity between the N and B terminals.

6. Reconnect the wires. Torque the bolt to 48 inch lbs.

mended by the manufacturer that they be removed from the vehicle as an assembly and then separated for repairs.

DRIVE AXLE

Front Halfshaft

REMOVAL & INSTALLATION

4WD Pick-Up, 4Runner and Van

1. Remove the 4WD hub (with the flange) from the axle hub.

2. Raise and safely support the vehicle. Remove the wheel and tire assembly.

3. Disconnect and plug the brake line from the caliper. Remove the caliper from the axle hub.

4. Using a drift punch and a hammer, drive the lock washer tabs away from the locknut.

5. Remove the locknut from the halfshaft. Remove the lock washer, the adjusting nut, the thrust washer, the outer bearing and the axle hub/disc assembly from the vehicle.

6. Remove the knuckle spindle bolts, the dust seal and the dust cover. Using a brass bar and a hammer, tap the steering spindle from the steering knuckle.

7. Turn the halfshaft until a flat spot on the outer shaft is in the upper position, then pull the halfshaft from the steering knuckle.

8. Using a slide hammer, pull the oil seal from the axle housing.

9. Using a clean shop towel, wipe the grease from inside the steering knuckle housing and the halfshaft.

To install:

10. Using an oil seal installation tool, drive a new oil seal into the axle housing until it seats.

11. Install the halfshaft into the axle housing.

12. Using multi-purpose grease, fill the steering knuckle cavity to about 3/4 full.

13. To complete the installation, use new seals/gaskets and reverse the removal procedures.

14. Torque the steering spindle-to-steering knuckle bolts to 38 ft. lbs., the axle hub adjusting nut to 18 ft. lbs., the axle hub locknut to 33 ft. lbs., the free wheel/locking hub nuts to 23 ft. lbs. and the brake caliper to 65 ft. lbs.

NOTE: To install the wheel bearings with the axle hub, torque the adjusting nut to 43 ft. lbs., turn the axle hub (back and forth, several times), loosen the nut and retorque the adjusting nut to 18 ft. lbs.

15. Install the wheel and tire assembly. Lower the vehicle.

Driveshaft and U-Joints

REMOVAL & INSTALLATION

4WD Vehicles Except Long Bed Pick-Up and Land Cruiser

REAR

1. Raise and safely support the vehicle.

2. Paint a mating mark on the

Driveshaft assemblies—Pick-Up and 4Runner

TRANSFER CASE

Transfer Case Assembly

REMOVAL & INSTALLATION

The transfer case and transmission are connected together. It is recom-

halves of the rear universal joint flange.

3. Remove the bolts which hold the rear flange together.

4. Remove the splined end of the driveshaft from the transmission.

NOTE: Plug the end of the transmission with a rag or dummy flange to avoid losing transmission oil.

5. Remove the driveshaft from under the vehicle.

6. To install, reverse the removal procedures. Grease the splined end of the shaft before installing. Torque bolts to 31 ft. lbs. (Van) or 54 ft. lbs. (Pick-Up and 4Runner).

2WD Long Bed Pick-Up

REAR

1. Raise and safely support the vehicle.

2. Paint mating marks on all 6 flange halves.

3. Remove the bolts attaching the rear universal joint flange to the drive pinion flange.

4. Drop the rear section of the shaft slightly and pull the unit out of the center bearing sleeve yoke.

5. Remove the center bearing support from the crossmember.

6. Unbolt the driveshaft flange from the rear of the transmission and remove driveshaft along with center bearing support.

7. To install, align the matchmarks and reverse the removal procedures. Torque the flange bolts to 54 ft. lbs.

4WD Vehicles

FRONT

1. Raise and safely support the vehicle.

2. Matchmark the driveshaft flange at the front axle housing and the transfer case.

3. On Vans, remove the differential support bracket.

4. On Pick-Up and 4Runner, remove the falgne dust cover.

5. Remove the bolts retaining the driveshaft and remove the driveshaft from the vehicle.

6. Install the driveshaft by aligning the matchmarks made during removal.

7. Torque the retaining bolts to 54–58 ft. lbs. (74–78 Nm).

Front Axle Shaft

REMOVAL & INSTALLATION

Land Cruiser

1. Raise and safely support the ve-

hicle. Remove the wheel and tire assembly.

2. Plug the brake master cylinder reservoir to prevent brake fluid leakage from the disconnected brake flexible hose.

3. Remove the outer axle shaft flange cap (automatic locking hub) or the hub cover bolts and the cover (free wheel locking hub) and the shaft snapping from the axle hub.

4. Remove the outer axle shaft flange (automatic locking hub) or the hub ring-to-axle hub bolts, then alternately, screw 2 service bolts into the shaft flange or hub ring and remove the shaft flange or the hub ring with it's gasket.

5. Remove the caliper and disc.

6. Straighten the lockwasher and remove the front wheel bearing adjusting nuts with front wheel adjusting nut wrench or similar tool.

7. Remove the front axle hub together with its claw washer, bearings and oil seal.

8. Remove the clip and disconnect the brake flexible hose from the brake tube.

9. Cut and remove the lock wire.

10. Using a soft mallet, lightly, tap the steering knuckle spindle and remove the spindle with it's gasket.

NOTE: When removing the steering knuckle spindle on a vehicle equipped with the ball joint type axle shaft joint, be prepared for the disconnection of the outer axle shaft from the joint. Prevent the shaft joint ball from falling from the joint.

11. If equipped with the ball type axle shaft joint, slide the inner front axle shaft out of the axle housing. If equipped with the Birfield constant velocity joint type of axle shaft joint, re-

move the entire axle shaft assembly from the axle housing.

12. Using a bearing puller, remove the bushing from inside of knuckle spindle and the axle housing oil seal. Using a metal tube as a seating tool, drive oil seal into the axle housing and the new bushing into the knuckle spindle.

NOTE: If equipped with the ball joint type axle joint, install the inner axle with its proper spacer in position until the splines are fully meshed with the differential. If equipped with the Birfield constant velocity joint axle joint, install the axle into the housing and rotate the axle shaft until its splines mesh with the differential. Fill the steering knuckle about $\frac{3}{4}$ full with grease and place the joint ball on the inner shaft end.

13. To complete the installation, reverse the removal procedures. Adjust the wheel bearing preload.

Front Axle Bearing

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the 4WD hubs.

2. Using a small pry bar, pry the grease seal from the rear of the disc/hub assembly, then remove the inner bearing from the assembly.

3. Using a shop cloth, wipe the grease from inside the disc/hub assembly.

4. Using a brass drift, drive the outer bearing races from each side of the disc/hub assembly.

5. Using solvent, clean all of the parts and blow dry with compressed air.

Front drive axle assembly—Pick-Up and 4Runner

To install:

6. Using a bearing installation tool, drive the outer races into the disc/hub assembly until they seat against the shoulder.

7. Using multi-purpose grease, coat the area between the races and pack the bearings.

8. Place the inner bearing into the rear of the disc/hub assembly. Using a bearing installation tool, drive a new grease seal into the rear of the disc/hub assembly until it is flush with the housing.

9. Install the disc/hub assembly onto the axle shaft, the outer bearing, the thrust washer and the adjusting nut.

10. To adjust the bearing preload, perform the following:

a. Torque the adjusting nut to 43 ft. lbs.

b. Turn the disc/hub assembly 2-3 times, from the left to the right.

c. Loosen the adjusting nut until it can be turned by hand.

d. Retorque the adjusting nut to 18 ft. lbs.

e. Install the lock washer and the locknut. Torque the locknut to 33 ft. lbs.

f. Check that the bearing has no play.

g. Using a spring gauge, connect it to a wheel stud, the gauge should be held horizontal, then measure the rotating force, it should be 6-12 lbs.

11. Lower the vehicle.

Rear Axle Shaft and Bearings

REMOVAL & INSTALLATION

Pick-Up and 4Runner

1. Loosen the rear wheel lug nuts, then raise and safely support the vehicle. Remove the wheel and tire assembly.

2. Place a pan under the axle, remove the plug and drain the axle housing.

3. For 2WD vehicles, remove the clip/clamp-to-frame bolts and disconnect the parking brake cable from the equalizer. For 4WD vehicles, remove the pin and disconnect the rear parking brake cable from the bell crank.

4. Remove the brake drum securing screw and the drum.

5. Disconnect the brake line from the wheel cylinder and plug it, being careful not to damage the fitting.

6. Remove the brake backing plate-to-axle housing nuts and pull the backing plate with the axle from the axle housing.

NOTE: When removing the axle shaft, be careful not to damage the oil seal.

7. Using a pair of snapping pliers, remove the snapping from the axle shaft.

8. Slip tool No. 09521-25011, or its equivalent, over the axle shaft and fasten it to the backing plate. Using 2 metal blocks and a press, press the axle from the backing plate assembly.

9. If necessary to remove the bearing from backing plate, perform the following:

a. Remove the brake spring, the retracting spring clamp bolt, the lower springs, the shoe strut, the brake shoes and the parking brake lever.

b. Using a slide hammer puller, pull the outer oil seal from the backing plate.

c. Press the bearing from the backing plate.

d. Using the proper installation tools, press the new bearing into the backing plate.

e. Using the proper seal installation tool, press the new oil seal into the backing plate.

f. Reassemble the brake components to the backing plate.

10. Using a slide hammer, pull the oil seal from the axle housing.

To install:

11. Using the installation tool and a hammer, drive a new oil seal into the axle housing.

12. Using a press, press the axle shaft into the backing plate and the bearing retainer. Using snapping pliers, install the snapping onto the axle shaft.

13. Clean the gasket mounting surfaces.

14. To complete the installation, reverse the removal procedures. Torque the backing plate-to-axle housing nuts to 51 ft. lbs. Adjust the brake shoe clearance and bleed the brake system. Refill the axle housing with SAE 90W GL5 gear oil.

Van

1. Loosen the rear wheel nuts. Raise and safely support the vehicle. Remove the wheel and tire assembly.

2. Working through the hole in the axle flange, remove the backing plate-to-axle housing bolts.

3. Using a slide hammer puller, pull the axle shaft from the housing.

4. Using a grinder, grind down the inner bearing retainer on the axle shaft. Using a chisel and a hammer, cut off the retainer and remove it from the shaft.

5. Using a arbor press, press the bearing from the axle shaft.

6. Using a slide hammer puller, pull the oil seal from the axle housing.

To install:

7. Lubricate the new oil seal with multi-purpose grease. Using the proper seal installation tool and a hammer, drive the new oil seal into the axle housing to a depth of 0.236 in.

8. To install, use new gaskets and reverse the removal procedures. Torque the axle retainer-to-housing bolts to 48 ft. lbs.

Land Cruiser

SEMI-FLOATING TYPE

1. Loosen the rear wheel nuts. Raise and safely support the vehicle. Remove the wheel and tire assembly.

2. Place a pan under the axle, remove the plug and drain the oil from the differential.

3. Remove the brake drum and related parts, as follows:

a. Remove the cover from the back of the differential housing.

b. Remove the pin from the differential pinion shaft.

c. Withdraw the pinion shaft and its spacer from the case.

d. Use a mallet to tap the rear axle shaft toward the differential, then remove the C-lock from the axle shaft.

e. Withdraw the axle shaft from the housing.

4. Using a bearing puller, remove axle bearing and oil seal together from the axle housing. Using a metal tube and a hammer, drive the bearing and the seal into the housing until they seat.

NOTE: Do not mix the parts of the left and right axle shaft assemblies.

5. To complete the installation, reverse the removal procedures. Refill the axle housing with SAE 90W GL5 gear oil.

NOTE: After installing the axle shaft, C-lock, spacer and pinion shaft, measure the clearance between the axle shaft and the pinion shaft spacer with a feeler gauge. The clearance should fall between 0.0024-0.0181 in. If the clearance is not within specifications, use one of the following spacers to adjust it:

a. 1.172-1.173 in.

b. 1.188-1.189 in.

c. 1.204-1.205 in.

FULL FLOATING TYPE

1. Loosen the rear wheel nuts. Raise and safely support the vehicle. Remove the wheel and tire assembly.

2. Place a pan under the axle, remove the plug and drain the oil from the differential.

3. Remove the rear axle shaft plate nuts.

4. Remove the cone washers from the mounting studs by tapping the slits of the washers with a tapered punch.

5. Install bolts into the 2 unused holes of the axle shaft plate.

6. Tighten the bolts to draw the axle shaft assembly out of the housing.

7. To install, use a new gasket, sealant and reverse the removal procedures. Torque the axle shaft nuts to 21-25 ft. lbs.

Front Wheel Hub, Knuckle and Bearing

REMOVAL & INSTALLATION

2WD Pick-Up, 4Runner and Van

1. Raise and safely support the ve-

hicle. Remove the wheel and tire assembly.

2. Remove the brake caliper (do not disconnect the brake hose from the caliper) and suspend it on a wire.

3. Remove axle hub dust cap, the cotter pin, the nut lock, the adjusting nut, the thrust washer and the outer bearing, then pull the hub/disc assembly from the axle spindle.

4. Remove the backing plate cotter pins and the mounting nuts or bolts, then the backing plate.

5. Remove steering knuckle arm from the back of the steering knuckle.

6. Remove the nuts, the retainers and the bushings, then the shock absorber from the lower control arm.

7. Support the lower arm with a jack and raise to put pressure on spring.

NOTE: Be careful not to unbalance vehicle support stands when jacking up lower arm.

8. Remove cotter pins, then the upper and lower ball joint nuts. Using a

ball joint removal tool, separate the ball joints from the steering knuckle.

9. Remove the steering knuckle from the vehicle.

NOTE: Whenever the hub/disc assembly is removed from the vehicle, it is good practice to replace the grease seal.

10. To install, reverse the removal procedures. Torque the upper ball joint nut to 80 ft. lbs. (Pick-Up and 4Runner) or 58 ft. lbs. (Van), the lower ball joint nut to 105 ft. lbs. (Pick-Up and 4Runner) or 76 ft. lbs., the steering knuckle arm-to-steering knuckle bolts to 80 ft. lbs. (Pick-Up and 4Runner) or 61 ft. lbs. (Van), the shock absorber-to-lower control arm nuts to 19 ft. lbs. and the backing plate-to-steering knuckle bolts to 80 ft. lbs. (Pick-Up and 4Runner) or 61 ft. lbs. (Van). Adjust the wheel bearing.

4WD Vehicles

1. Remove the front axle shaft assembly from the vehicle.

2. Remove the oil seal retainer and the oil seal set from the rear of the steering knuckle.

3. At the drag link end of the steering knuckle arm, remove the cotter pin. Using the proper tool, remove the plug from the drag link, then disconnect the drag link from the steering knuckle arm.

4. Remove the tie-rod-to-steering knuckle, cotter pin and nut. Using the proper ball joint removal tool, separate the tie-rod from the steering knuckle arm.

5. Remove the steering knuckle

Front hub and steering knuckle—typical 4WD vehicle

Front hub and steering knuckle—typical 2WD vehicle

To install:

6. Using a bearing installation tool, drive the outer races into the disc/hub assembly until they seat against the shoulder.
7. Using multi-purpose grease, coat the area between the races and pack the bearings.
8. Place the inner bearing into the rear of the disc/hub assembly. Using a bearing installation tool, drive a new grease seal into the rear of the disc/hub assembly until it is flush with the housing.
9. Install the disc/hub assembly onto the axle shaft, the outer bearing, the thrust washer and the adjusting nut.
10. To adjust the bearing preload, perform the following:
 - a. Torque the adjusting nut to 43 ft. lbs.
 - b. Turn the disc/hub assembly 2-3 times, from the left to the right.
 - c. Loosen the adjusting nut until it can be turned by hand.
 - d. Retorque the adjusting nut to 18 ft. lbs.
 - e. Install the lock washer and the locknut. Torque the locknut to 33 ft. lbs.
 - f. Check that the bearing has no play.
 - g. Using a spring gauge, connect it to a wheel stud, the gauge should be held horizontal, then measure the rotating force, it should be 6-12 lbs.
11. Lower the vehicle.

Rear Axle Shaft and Bearings

REMOVAL & INSTALLATION

Pick-Up and 4Runner

1. Loosen the rear wheel lug nuts, then raise and safely support the vehicle. Remove the wheel and tire assembly.
2. Place a pan under the axle, remove the plug and drain the axle housing.
3. For 2WD vehicles, remove the clip/clamp-to-frame bolts and disconnect the parking brake cable from the equalizer. For 4WD vehicles, remove the pin and disconnect the rear parking brake cable from the bell crank.
4. Remove the brake drum securing screw and the drum.
5. Disconnect the brake line from the wheel cylinder and plug it, being careful not to damage the fitting.
6. Remove the brake backing plate-to-axle housing nuts and pull the backing plate with the axle from the axle housing.

NOTE: When removing the axle shaft, be careful not to damage the oil seal.

7. Using a pair of snapping pliers, remove the snapping from the axle shaft.
8. Slip tool No. 09521-25011, or its equivalent, over the axle shaft and fasten it to the backing plate. Using 2 metal blocks and a press, press the axle from the backing plate assembly.
9. If necessary to remove the bearing from backing plate, perform the following:
 - a. Remove the brake spring, the retracting spring clamp bolt, the lower springs, the shoe strut, the brake shoes and the parking brake lever.
 - b. Using a slide hammer puller, pull the outer oil seal from the backing plate.
 - c. Press the bearing from the backing plate.
 - d. Using the proper installation tools, press the new bearing into the backing plate.
 - e. Using the proper seal installation tool, press the new oil seal into the backing plate.
 - f. Reassemble the brake components to the backing plate.
10. Using a slide hammer, pull the oil seal from the axle housing.

To install:

11. Using the installation tool and a hammer, drive a new oil seal into the axle housing.
12. Using a press, press the axle shaft into the backing plate and the bearing retainer. Using snapping pliers, install the snapping onto the axle shaft.
13. Clean the gasket mounting surfaces.
14. To complete the installation, reverse the removal procedures. Torque the backing plate-to-axle housing nuts to 51 ft. lbs. Adjust the brake shoe clearance and bleed the brake system. Refill the axle housing with SAE 90W GL5 gear oil.

Van

1. Loosen the rear wheel nuts. Raise and safely support the vehicle. Remove the wheel and tire assembly.
2. Working through the hole in the axle flange, remove the backing plate-to-axle housing bolts.
3. Using a slide hammer puller, pull the axle shaft from the housing.
4. Using a grinder, grind down the inner bearing retainer on the axle shaft. Using a chisel and a hammer, cut off the retainer and remove it from the shaft.
5. Using a arbor press, press the bearing from the axle shaft.

6. Using a slide hammer puller, pull the oil seal from the axle housing.

To install:

7. Lubricate the new oil seal with multi-purpose grease. Using the proper seal installation tool and a hammer, drive the new oil seal into the axle housing to a depth of 0.236 in.
8. To install, use new gaskets and reverse the removal procedures. Torque the axle retainer-to-housing bolts to 48 ft. lbs.

Land Cruiser

SEMI-FLOATING TYPE

1. Loosen the rear wheel nuts. Raise and safely support the vehicle. Remove the wheel and tire assembly.
2. Place a pan under the axle, remove the plug and drain the oil from the differential.
3. Remove the brake drum and related parts, as follows:
 - a. Remove the cover from the back of the differential housing.
 - b. Remove the pin from the differential pinion shaft.
 - c. Withdraw the pinion shaft and its spacer from the case.
 - d. Use a mallet to tap the rear axle shaft toward the differential, then remove the C-lock from the axle shaft.
 - e. Withdraw the axle shaft from the housing.
4. Using a bearing puller, remove axle bearing and oil seal together from the axle housing. Using a metal tube and a hammer, drive the bearing and the seal into the housing until they seat.

NOTE: Do not mix the parts of the left and right axle shaft assemblies.

5. To complete the installation, reverse the removal procedures. Refill the axle housing with SAE 90W GL5 gear oil.

NOTE: After installing the axle shaft, C-lock, spacer and pinion shaft, measure the clearance between the axle shaft and the pinion shaft spacer with a feeler gauge. The clearance should fall between 0.0024-0.0181 in. If the clearance is not within specifications, use one of the following spacers to adjust it:

- a. 1.172-1.173 in.
- b. 1.188-1.189 in.
- c. 1.204-1.205 in.

FULL FLOATING TYPE

1. Loosen the rear wheel nuts. Raise and safely support the vehicle. Remove the wheel and tire assembly.

2. Place a pan under the axle, remove the plug and drain the oil from the differential.

3. Remove the rear axle shaft plate nuts.

4. Remove the cone washers from the mounting studs by tapping the slits of the washers with a tapered punch.

5. Install bolts into the 2 unused holes of the axle shaft plate.

6. Tighten the bolts to draw the axle shaft assembly out of the housing.

7. To install, use a new gasket, sealant and reverse the removal procedures. Torque the axle shaft nuts to 21-25 ft. lbs.

Front Wheel Hub, Knuckle and Bearing

REMOVAL & INSTALLATION

2WD Pick-Up, 4Runner and Van

1. Raise and safely support the ve-

hicle. Remove the wheel and tire assembly.

2. Remove the brake caliper (do not disconnect the brake hose from the caliper) and suspend it on a wire.

3. Remove axle hub dust cap, the cotter pin, the nut lock, the adjusting nut, the thrust washer and the outer bearing, then pull the hub/disc assembly from the axle spindle.

4. Remove the backing plate cotter pins and the mounting nuts or bolts, then the backing plate.

5. Remove steering knuckle arm from the back of the steering knuckle.

6. Remove the nuts, the retainers and the bushings, then the shock absorber from the lower control arm.

7. Support the lower arm with a jack and raise to put pressure on spring.

NOTE: Be careful not to unbalance vehicle support stands when jacking up lower arm.

8. Remove cotter pins, then the upper and lower ball joint nuts. Using a

ball joint removal tool, separate the ball joints from the steering knuckle.

9. Remove the steering knuckle from the vehicle.

NOTE: Whenever the hub/disc assembly is removed from the vehicle, it is good practice to replace the grease seal.

10. To install, reverse the removal procedures. Torque the upper ball joint nut to 80 ft. lbs. (Pick-Up and 4Runner) or 58 ft. lbs. (Van), the lower ball joint nut to 105 ft. lbs. (Pick-Up and 4Runner) or 76 ft. lbs., the steering knuckle arm-to-steering knuckle bolts to 80 ft. lbs. (Pick-Up and 4Runner) or 61 ft. lbs. (Van), the shock absorber-to-lower control arm nuts to 19 ft. lbs. and the backing plate-to-steering knuckle bolts to 80 ft. lbs. (Pick-Up and 4Runner) or 61 ft. lbs. (Van). Adjust the wheel bearing.

4WD Vehicles

1. Remove the front axle shaft assembly from the vehicle.

2. Remove the oil seal retainer and the oil seal set from the rear of the steering knuckle.

3. At the drag link end of the steering knuckle arm, remove the cotter pin. Using the proper tool, remove the plug from the drag link, then disconnect the drag link from the steering knuckle arm.

4. Remove the tie-rod-to-steering knuckle, cotter pin and nut. Using the proper ball joint removal tool, separate the tie-rod from the steering knuckle arm.

5. Remove the steering knuckle

Front hub and steering knuckle—typical 4WD vehicle

Front hub and steering knuckle—typical 2WD vehicle

arm-to-steering knuckle (top) nuts and the steering knuckle-to-bearing cap (bottom) nuts. Using a tapered punch, tap the cone washers slits and remove the washers.

NOTE: Do not mix or lose the upper and lower bearing cap shims.

6. Using a bearing removal tool (without a collar), press the steering knuckle arm with the shims from the steering knuckle.

7. Using a bearing removal tool (without a collar), press the bearing cap with the shims from the steering knuckle.

8. Remove the steering knuckle from the vehicle.

To install:

9. To install the steering knuckle, use a suitable tool to support the upper inner bearing. Using a hammer, tap the steering knuckle arm into the bearing inner race.

10. Using the proper tool, support the lower bearing inner race. Using a hammer, tap the bearing cap into the bearing inner race.

NOTE: When installing the drag link-to-steering knuckle arm, torque the plug all the way, then loosen it 1 1/3 turns and secure it with the cotter pin.

11. To install, use gaskets, seals, pack the steering knuckle with multi-

purpose grease and reverse the removal procedures. Torque the steering knuckle arm-to-steering knuckle nuts to 71 ft. lbs., the bearing cap-to-steering knuckle nuts to 71 ft. lbs., the tie-rod-to-steering knuckle arm nut to 67 ft. lbs., the axle spindle-to-steering knuckle bolts to 38 ft. lbs. Adjust the wheel bearing preload.

NOTE: To test the knuckle bearing preload, attach a spring scale to the tie-rod end hole (at a right angle) in the steering knuckle arm. The force required to move the knuckle from side to side should be 6.6-13 lbs. or 4-5 lbs. (Land Cruiser). If the preload is not correct, adjust by replacing shims.

Locking Hubs

REMOVAL & INSTALLATION

1. If equipped with free-wheeling hubs, turn the hub control handle to the **FREE** position.

2. Remove the hub cover bolts and pull off the cover.

3. If equipped with automatic locking hubs, remove the axle bolt with the washer.

4. Using snapping pliers, remove the snapping from the axle shaft.

5. Remove the hub body mounting nuts.

6. Remove the cone washers from the hub body mounting studs by tapping on the washer slits with a tapered punch.

7. Remove the hub body from the axle hub.

8. Apply multi-purpose grease to the inner hub splines.

9. To install, use new gaskets and reverse the removal procedures. Torque the hub body-to-axle hub nuts to 23 ft. lbs., the plate washer/bolt to 13 ft. lbs. (auto. locking hub) and the hub cover-to-hub body bolts to 7 ft. lbs.

NOTE: To install the snapping onto the axle shaft, install a bolt into the axle shaft, pull it out and install the snapping.

Pinion Seal

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Matchmark and remove the driveshaft.

3. Remove the companion flange from the differential.

4. Using puller 09308-10010 or equivalent, remove the oil seal from the housing.

5. Remove the oil slinger.

6. Remove the bearing and spacer.

To install:

7. Install the bearing spacer and bearing.

NOTE: Lubricate the seal lips with multi-purpose grease before installing it.

8. Install the oil slinger and using seal installer 09554-30011 or equivalent, install the oil seal.

9. Drive the seal into place, to a depth of 0.59 in. below the housing lip for 7.5 in. axles and 0.39 in. below the lip for 8 in. axles.

10. Install the companion flange and install the driveshaft.

11. Lower the vehicle.

Differential Carrier

REMOVAL & INSTALLATION

Rear

1. Raise and safely support the vehicle. Drain the lubricant from the differential.

2. Remove the axle shafts from the axle housing.

3. Matchmark the driveshaft flange to the differential flange. Remove the mounting bolts and separate the driveshaft from the differential.

4. Remove the carrier retaining

Manual 4WD hub assembly

Axle Housing

REMOVAL & INSTALLATION

Front—4WD Vehicles

1. Raise and safely support the vehicle.
 2. Matchmark and remove the front driveshaft.
 3. Disconnect the axle shafts from the axle assembly.
 4. Disconnect vacuum hoses, if equipped with automatic locking hubs.
 5. Disconnect the 4WD indicator. Remove the front differential mounting bolt.
 6. Support the axle housing with an suitable jack and remove the rear mounting bolts.
- To install:**
7. Install the differential in position under the vehicle.
 8. Install the rear mounting bolts and torque to 123 ft. lbs. (167 Nm).
 9. Install the front mounting bolt and torque to 108 ft. lbs. (147 Nm).
 10. Connect vacuum hoses and the 4WD indicator.
 11. Install the axle shafts and the driveshaft, aligning matchmarks made during removal.
 12. Refill the axle with the correct oil and lower the vehicle.

Rear—Except Van

1. Raise and safely support the vehicle.
2. Remove the tire and wheel assemblies.
3. Support the axle housing with a suitable jack.
4. Disconnect the shock absorber lower bolts.
5. Disconnect the stabilizer bar and lateral rod. Disconnect the brake lines from the axle housing.
6. Remove the leaf spring U-bolts and carefully lower the axle housing from the vehicle.
7. Installation is the reverse of the removal procedure. Torque the shock absorber lower bolts to 19 ft. lbs (25 Nm) on 2WD vehicles and to 47 ft. lbs (64 Nm) on 4WD vehicles. Tighten the U-bolt nuts to 90 ft. lbs (123 Nm).

Rear—Van

1. Raise and safely support the vehicle.
2. Remove the tire and wheel assemblies.
3. Support the axle housing with a suitable jack.
4. Disconnect the shock absorber lower bolts.
5. Disconnect the stabilizer bar and lateral rod. Also, disconnect the upper and lower control arms.

Automatic 4WD hub assembly

nuts and pull the carrier assembly out of the differential housing.

5. To install, use new gaskets and reverse the removal procedures. Torque the differential-to-axle nuts to 23 ft. lbs. and the driveshaft flange-to-differential flange nuts/bolts to 31 ft. lbs. Refill the axle with 80W-90 gear oil to a level of $\frac{1}{4}$ in. below the fill hole.

NOTE: Before installing the carrier, apply a thin coat of liquid or silicone sealer to the carrier housing gasket and to the carrier side face of each carrier retaining nut.

Front

1. Raise and safely support the vehicle. Drain the lubricant from the differential.
2. Remove the front axle shafts from the axle housing.
3. Matchmark the front driveshaft

flange to the differential flange. Remove the mounting bolts and separate the driveshaft from the differential.

4. Remove the carrier retaining nuts and pull the carrier assembly out of the differential housing.

5. To install, use new gaskets and reverse the removal procedures. Torque the differential-to-axle nuts to 19 ft. lbs. and the front driveshaft flange-to-differential flange nuts/bolts to 54 ft. lbs. Refill the axle with 80W-90 gear oil to a level of $\frac{1}{4}$ in. below the fill hole.

NOTE: Before installing the carrier, apply a thin coat of liquid or silicone sealer to the carrier housing gasket and to the carrier side face of each carrier retaining nut.

6. Remove the brake lines from the axle housing.

7. Slowly lower the axle housing from the vehicle.

8. Installation is the reverse of the removal procedure. Observe the following torques:

- Shock absorber bottom bolts—27 ft. lbs (37 Nm) 2WD, 94 ft. lbs (127 Nm) 4WD vehicles.
- Upper control arm bolts—105 ft. lbs. (142 Nm).
- Lower control arm bolts—105 ft. lbs. (142 Nm).
- Stabilizer bar bolts—19 ft. lbs (25 Nm).

STEERING

Steering Wheel

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Position the wheels in a straight ahead position.
2. Remove the steering wheel center cover, some vehicles use a screw to retain the cover.
3. Disconnect the horn wire. Matchmark the wheel and the shaft.
4. Using an appropriate wheel puller tool remove the steering wheel.
5. Installation is the reverse of the removal procedure. Tighten the steering wheel nut to 25 ft. lbs (34 Nm).

Manual Steering Gear

REMOVAL & INSTALLATION

2WD Pick-Up

1. Raise and safely support the vehicle. Remove the pitman arm-to-relay rod cotter pin and nut. Separate the relay rod from the pitman arm.
2. Matchmark the flexible steering coupling-to-steering gear, then remove the lock bolt and separate the steering coupling from the steering gear.
3. Remove the steering gear housing mounting bolts and the gear housing.
4. To install, reverse the removal procedures. Torque the housing-to-frame bolts to 48 ft. lbs., the pitman arm-to-relay rod nut 67 ft. lbs. and the steering gear-to-coupling yoke to 15–20 ft. lbs.

4WD Pick-Up and 4Runner

1. Raise and safely support the ve-

hicle. Remove the stone shield from the gear housing, if equipped.

2. Matchmark the intermediate shaft-to-steering gear and disconnect them.

3. Remove the cotter pin and plug from the drag link.

4. Disconnect the drag link from the pitman arm.

5. Remove the pitman arm nut. Using a puller tool, separate the pitman arm from the steering gear.

6. Remove the steering gear housing-to-frame bolts and the gear housing.

7. To install, reverse the removal procedures. Torque the steering gear-to-frame bolts to 42 ft. lbs., the steering gear-to-intermediate bolts to 29 ft. lbs., the pitman arm-to-steering gear nut to 127 ft. lbs.

NOTE: When installing the drag link to the pitman arm, tighten the plug completely and loosen it 1 1/3 turns.

Van

1. Raise and safely support the vehicle.
2. Remove the wheel and tire assemblies.
3. Disconnect the tie rod ends from the steering knuckle.
4. Matchmark and disconnect the intermediate shaft from the gear.
5. Remove the retaining bolts from the 2 brackets and slide the rack out from under the vehicle.
6. Installation is the reverse of the removal procedure. Torque the bracket bolts to 56 ft. lbs (76 Nm), the coupling bolts to 26 ft. lbs. (35 Nm) and the tie rod bolts to 43 ft. lbs. (59 Nm).

Land Cruiser

1. Raise and safely support the vehicle. Remove the worm yokes from the worm and the main shaft.
2. Remove the intermediate shaft assembly.
3. Remove the pitman arm from the sector shaft.
4. Remove the steering gear-to-

Manual steering gear assembly—all except Van

frame bolts and the steering gear from the vehicle.

5. To install, reverse the removal procedures. Torque the pitman arm to 119–141 ft. lbs.

NOTE: The intermediate shaft must be installed with the wheels in a straight ahead position and the steering wheel straight ahead.

Power Steering Gear REMOVAL & INSTALLATION

2WD Pick-Up

1. Raise and safely support the vehicle. Disconnect and plug the pressure line clamp bolts at the steering gear.
2. Matchmark the intermediate shaft-to-steering gear, then, remove the coupling bolt and separate the intermediate shaft from the steering gear.
3. Remove the pitman arm-to-steering gear and the pitman arm-to-relay rod nuts.
4. Using a puller tool, separate the pitman arm from the relay rod and the pitman arm from the steering gear.
5. Remove the steering gear-to-frame bolts and the steering gear from the vehicle.
6. To install, reverse the removal procedures. Torque the steering gear-to-frame bolts to 48 ft. lbs., the pitman arm-to-steering gear nut to 90 ft. lbs., the pitman arm-to-relay rod nut to 67 ft. lbs., the intermediate shaft-to-steering gear bolt to 19 ft. lbs. and the pressure line nuts to 33 ft. lbs. Bleed the power steering system.

4WD Pick-Up and 4Runner

1. Remove the battery and the engine lower gravel shield.
2. Raise and safely support the vehicle. Disconnect and plug the pressure lines at the steering gear.
3. Remove the steering gear stone shield.
4. Matchmark the intermediate shaft-to-steering gear, then remove coupling bolt and the intermediate shaft from the steering gear.
5. Remove the pitman arm-to-steering gear nut. Using a puller tool, separate the pitman arm from the steering gear.
6. Remove the gear housing-to-frame bolts and the steering gear from the vehicle.
7. To install, reverse the removal procedures. Torque the steering gear-to-frame bolts to 42 ft. lbs., the pitman arm-to-steering gear nut to 127 ft. lbs., the intermediate shaft-to-steering

Steering gear removal—Van

gear bolt to 29 ft. lbs. and the pressure line union nuts to 33 ft. lbs. Bleed the power steering system.

Van

1. Raise and safely support the vehicle.
2. Remove the wheel and tire assemblies.
3. Disconnect and plug the power steering fluid lines from the gear.
4. Disconnect the tie rod ends from the steering knuckle.
5. Matchmark and disconnect the intermediate shaft from the gear.
6. Remove the retaining bolts from the 2 brackets and slide the rack out from under the vehicle.
7. Installation is the reverse of the removal procedure. Torque the bracket bolts to 56 ft. lbs. (76 Nm), the coupling bolts to 26 ft. lbs. (35 Nm) and the tie rod bolts to 43 ft. lbs. (59 Nm).

Land Cruiser

1. Raise and safely support the vehicle. Disconnect the pressure lines from the steering gear.
2. Remove the intermediate shaft-to-steering gear bolt and the steering column-to-firewall bolts.
3. Loosen the steering column-to-dash bolts. Remove the pitman arm-to-steering gear nut.
4. Using a puller, separate the relay rod from the pitman shaft and the pitman arm from the steering gear.
5. Pull the steering column towards the passenger compartment to uncouple the steering shaft from the steering gear.
6. Remove the steering gear-to-frame bolts and the steering gear from the vehicle.

7. To install, reverse the removal procedures. Torque the steering gear-to-frame bolts to 40–63 ft. lbs., the pitman arm-to-steering gear nut to 120–141 ft. lbs., the intermediate shaft-to-steering gear bolt to 22–32 ft. lbs., the pressure hose fitting to 29–36 ft. lbs. and the return hose fitting to 24–30 ft. lbs. Bleed the power steering system.

NOTE: During installation of the hydraulic lines, position each line clear of any surrounding components, then tighten the fittings.

Power Steering Pump

REMOVAL & INSTALLATION

Pick-Up, Land Cruiser and 4Runner

NOTE: Disconnect the air hoses from the air control valve and the high tension wires from the distributor.

1. Disconnect the negative battery cable. Loosen the power steering pump pulley nut.

NOTE: Use the drive belt as a brake to keep the pulley from rotating.

2. Place a container under the pump. Disconnect the return line and the pressure tube, then drain the fluid into the container.
3. Loosen the idler pulley nut and the adjusting bolt, then remove the drive belt.
4. Remove the drive pulley and the Woodruff key from the pump shaft.

5. Remove the mounting bolts and the power steering pump from the vehicle.

6. To install, reverse the removal procedures. Torque the pump pulley mounting bolt to 29 ft. lbs., the pump pulley nut to 32 ft. lbs. and the pressure hoses to 33 ft. lbs. Adjust the drive belt tension. Bleed the power steering system.

Van

1. Disconnect the negative battery cable. Disconnect the air hoses from the air control valve of the power steering pump.
2. Drain the fluid from the power steering reservoir tank.
3. At the power steering pump, disconnect the return hose and the pressure tube.
4. Loosen the power steering pump adjusting bolt, then, remove the drive belt, the pulley and the woodruff key.
5. Remove the mounting bolts, the power steering pump and the bracket from the vehicle.
6. To install, reverse the removal procedures. Torque the power steering pump-to-engine bolts to 29 ft. lbs., the pulley set nut to 32 ft. lbs. and the pressure tube to 33 ft. lbs.

SYSTEM BLEEDING

1. Raise and safely support the vehicle.
2. Fill the pump reservoir with power steering fluid.
3. With the engine running, rotate the steering wheel from lock to lock several times. Add fluid as necessary.

NOTE: Perform the bleeding procedure until all of the air is bled from the system.

4. The fluid level should not have risen more than $\frac{2}{10}$ in.; if it does, check the pump.

Tie Rod Ends

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. Remove the wheel and tire assembly.
3. Using a tie rod end puller, disconnect the tie rod from the relay rod.
4. Using a tie rod end puller remove the tie rod from the steering knuckle.
5. Remove the tie rod end from the vehicle.
6. Installation is the reverse of the removal procedure. Tighten the clamp nuts to 19 ft. lbs. (25 Nm) and the knuckle-to-arm nuts to 67 ft. lbs.

BRAKES

For all brake system repair and service procedures not detailed below, please refer to "Brakes" in the Unit Repair section.

Master Cylinder

REMOVAL & INSTALLATION

Pick-Up, 4Runner and Land Cruiser

1. Disconnect the negative battery cable. Using a syringe, remove the brake fluid from the master cylinder.
2. Disconnect and plug the hydraulic lines at the master cylinder.
3. If equipped, disconnect the level warning switch connector from the master cylinder.
4. Remove the master cylinder-to-power booster nuts and the master cylinder assembly from the power brake unit.
5. To install, reverse the removal procedures. Torque the master cylinder mounting bolts to 9 ft. lbs. and the brake lines-to-master cylinder to 11 ft. lbs. Refill the master cylinder with new brake fluid and bleed the brake system.

Van

1. Disconnect the negative battery terminal from the battery.
2. To expose the master cylinder, perform the following:
 - a. Remove the master cylinder reservoir cap, located at the left-side of the instrument panel.

- b. Remove the instrument cluster finish panel and the lower cluster finish panel. Disconnect the electrical connectors and the speedometer cable from the instrument panel, then remove the instrument panel.
 - c. Remove the No. 1, 2 and 3 air ducts.
3. Using a syringe, remove the brake fluid from the master cylinder reservoir.
 4. Remove the reservoir hoses from the master cylinder. Disconnect and plug the brake lines at the master cylinder.
 5. Remove the master cylinder mounting nuts, the vacuum check valve bracket and the master cylinder from the vehicle.
 6. To install, reverse the removal procedures. Torque the master cylinder mounting nuts to 9 ft. lbs. and the brake lines-to-master cylinder to 11 ft. lbs. Refill the master cylinder with new brake fluid and bleed the brake system.

Load Sensing Proportioning Valve

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle, so that it is level.
2. Disconnect the No. 2 shackle from the bracket.
3. Disconnect and plug the brake lines from the load sensing valve.
4. Remove the load sensing valve bracket from the frame.
5. To install, reverse the removal procedures. Torque the load sensing valve-to-frame bolts to 14 ft. lbs. and

the brake tubes to 11 ft. lbs. Bleed the brake system.

6. Adjust the load sensing valve and the rear axle load.

7. Check and/or adjust the length of the No. 2 shackle (distance from the center of the No. 2 shackle-to-shackle bracket bolt to the center of the No. 1 shackle-to-spring bolt): 3.07 in. (2WD Pick-Up and Van) or 4.72 in. (4WD Pick-Up, 4Runner and Land Cruiser).

Power Brake Booster

REMOVAL & INSTALLATION

Except Van

1. Disconnect the negative battery cable. Separate the master cylinder from the power brake booster.
2. Remove the vacuum hose from the power brake booster.
3. Working under the instrument panel, remove the brake pedal-to-brake booster rod clevis pin. Remove the power brake booster mounting bolts and the booster from the vehicle.
4. To install, reverse the removal procedures. Torque the power brake booster nuts to 9 ft. lbs.

NOTE: When installing a new booster, make sure there is a little clearance between the pushrod end and the master cylinder piston.

Van

1. Disconnect the negative battery terminal from the battery.
2. To expose the master cylinder, perform the following:
 - a. Remove the master cylinder reservoir cap, located at the left-side of the instrument panel.
 - b. Remove the instrument cluster finish panel and the lower cluster finish panel. Disconnect the electrical connectors and the speedometer cable from the instrument panel, then remove the instrument panel.
 - c. Remove the No. 1, 2 and 3 air ducts.
3. Using a syringe, remove the brake fluid from the master cylinder reservoir.
4. Remove the reservoir hoses from the master cylinder. Disconnect and plug the brake lines at the master cylinder.
5. Remove the master cylinder mounting nuts, the vacuum check valve bracket and the master cylinder from the vehicle.
6. Remove the bolts retaining the brake pedal and booster bracket. Remove the bracket from the vehicle.
7. To install, reverse the removal procedures. Torque the master cylin-

Removing the brake booster and master cylinder—Van

der mounting nuts to 9 ft. lbs. and the brake lines-to-master cylinder to 11 ft. lbs. Refill the master cylinder with new brake fluid and bleed the brake system.

Brake Caliper

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. Remove the wheel and tire assembly.
3. Remove the 2 wire clips at the ends of the brake pad pins.
4. Pull out the pads and anti-rattle springs.
5. Lift out the anti squeal shims.
6. Plug the vent hole on the master cylinder cap, to prevent fluid leakage. Disconnect and plug the brake line from the caliper.
7. Remove the 2 caliper mounting bolts and remove the caliper.

To install:

8. Position the caliper and install the mounting bolts. Tighten the caliper mounting bolts to 29 ft. lbs. on 2WD vehicles and to 90 ft. lbs on 4WD vehicles.
9. Install the brake pads. Install the wheel and tire assembly and lower the vehicle.
10. Road test the vehicle.

Disc Brake Pads

REMOVAL & INSTALLATION

2WD Vehicle

1. Raise and safely support the vehicle.
2. Remove the wheel and tire assembly.
3. Remove the bottom caliper retaining bolt and loosen the top bolt.
4. Pivot the caliper upward and suspend it with wire, do not disconnect the brake line.
5. Remove the anti-squeal springs, brake pads, anti-squeal shims, wear indicator plates and the 4 pad support plates.
6. Installation is the reverse of the removal procedure. Torque the caliper bolts to 29 ft. lbs. (39 Nm).

4WD Vehicle

1. Raise and safely support the vehicle.
2. Remove the wheel and tire assembly.
3. Remove the brake pad retaining clips, 2 locating pins, anti-rattle spring, brake pads and anti-squeal shims.
4. Installation is the reverse of the removal procedure.

Brake Rotor

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. Remove the wheels and tires.
3. On 2WD vehicles, remove the grease cap, cotter pin and nut from the hub.
4. On 4WD vehicles, remove the bolt retaining the locking hub assembly and lift it off the hub. Remove the nuts and washer from the inside of the hub.
5. Remove the rotor from the vehicle. Be careful not to drop the bearings from the hub.

6. Installation is the reverse of the removal procedure. Adjust the wheel bearings as required.

7. Bleed the brake system.

Brake Drums

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. Remove the wheel and tire assemblies.
3. Remove the brake drum retaining screws.
4. Remove the drum from the vehicle. If the drum is difficult to remove, release the brake adjusters from behind the drum.

5. Install the drum on the vehicle and install the retaining screws.
6. Install the wheel and tire assemblies.
7. Lower the vehicle. Check the operation of the brakes and adjust as needed.

Brake Shoes

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. Remove the wheel and tire assemblies.
3. Remove the brake drum retaining screws and remove the brake drum.
4. Disconnect the return spring from the rear shoe.
5. Remove the rear shoe hold-down spring, cups and pin. Disconnect the anchor spring from the shoe and remove the shoe.
6. Remove the front shoe hold-down spring, cups and pin. Disconnect the parking brake cable from the lever and remove the front shoe with the adjuster.
7. Remove the adjuster from the front shoe.
8. Installation is the reverse of the removal procedure.
9. Adjust the brake shoes after the drum is installed. Once the vehicle is lowered, pump the brakes several times to seat the shoes.

Wheel Cylinder

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. Remove the wheel and tire assemblies.
3. Remove the brake drum and the brake shoes.
4. Disconnect and plug the brake line from the wheel cylinder.
5. Remove the wheel cylinder mounting bolts and remove the wheel cylinder from the vehicle.
6. Installation is the reverse of the removal procedure. Torque the mounting bolts to 7 ft. lbs. (10 Nm).
7. Bleed the brake system after installation.

Parking Brake Cable

ADJUSTMENT

2WD Pick-Up

1. Working under the vehicle, tighten the adjusting nut at the equalizer

until the travel is within limits and there is no drag at the rear shoes.

2. Apply the parking brake several times and again check that there is no drag with the brake released.

4WD Pick-Up and 4Runner

1. Working under the vehicle, tighten the bellcrank stopper screw until the play at the rear brake links is gone, then loosen the nut one full turn. Tighten the locknut.
2. Tighten one of the adjusting nuts on the intermediate lever while loosening the other, until the travel is correct. Tighten the locknuts.
3. Confirm that the bellcrank is in contact with the backing plate.

Van

1. Raise and safely support the rear of the vehicle.
2. Remove the shift knob and the console box.
3. At the parking brake handle, loosen the cable locknut. Pull the hand brake upward about 7-9 clicks.
4. Turn the adjust nut until the rear wheels can no longer be turned, then, tighten the locknut.
5. Install the console and the shift knob.

FRONT SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

2WD Pick-Up and Van

1. Raise and safely support the vehicle. Remove the wheel and tire assembly.
2. Unfasten the double nuts at the top end of the shock absorber. Remove the cushions and the cushion retainers.
3. Remove the shock absorber-to-lower control arm bolts.
4. Compress the shock absorber and remove it from the vehicle.
5. To install, reverse the removal procedures. Torque the shock absorber-to-lower control arm bolts to 13 ft. lbs. and the shock absorber-to-body nuts to 19 ft. lbs.

4WD Pick-Up, 4Runner and Van

1. Raise and safely support the vehicle. Remove the wheel and tire assembly.

Front suspension components—2WD vehicle

2. Unfasten the double nuts at the top end of the shock absorber. Remove the cushions and the cushion retainers.

3. Remove the shock absorber-to-axle housing bolt.

4. Compress the shock absorber and remove it from the vehicle.

5. To install, reverse the removal procedures. Torque the shock absorber-to-suspension arm nut/bolt to 101 ft. lbs. (Pick-Up and 4Runner) or 70 ft. lbs. (Van) and the shock absorber-to-body nuts to 19 ft. lbs.

Land Cruiser

1. Raise and safely support the vehicle. Remove the wheel and tire assembly.

2. Remove mounting bolts from the top and the bottom of the shock and remove shock.

3. To install, reverse the removal procedures.

Leaf Springs

REMOVAL & INSTALLATION

Land Cruiser

1. Raise and safely support the vehicle. Support the axle housing with a floor jack. Remove the wheel and tire assembly.

2. Lower the floor jack to take the tension off of the spring. Remove the shock absorber mounting nuts/bolts and the shock absorber.

3. Remove the cotter pins and the nuts from the lower end of the stabilizer link. Detach the link from the axle housing.

4. Remove the spring-to-axle housing u-bolt nuts, the spring bumper and the u-bolt.

5. At the front of the spring, remove the hanger pin bolt. Disconnect the spring from the bracket.

6. Remove the spring shackle retaining nuts and the spring shackle inner plate, then carefully pry out the spring shackle with a pry bar.

7. Remove the spring from the vehicle.

To install:

8. To install, perform the following procedure:

a. Install the rubber bushings in the eye of the spring.

b. Align the eye of the spring with the spring hanger bracket and drive the pin through the bracket holes and rubber bushings.

NOTE: Use soapy water as lubricant (if necessary), to aid in pin installation. Never use oil or grease.

c. Finger-tighten the spring hanger nuts/bolts.

d. Install the rubber bushings in the spring eye at the opposite end of the spring.

e. Raise the free end of the spring. Install the spring shackle through the bushings and the bracket.

f. Install the shackle inner plate and finger-tighten the retaining nuts.

g. Center the bolt head in the hole which is provided in the spring seat on the axle housing.

h. Fit the u-bolts over the axle housing. Install the spring bumper and the nuts.

9. To complete the installation, reverse the removal procedures. Torque the u-bolt nuts to 90 ft. lbs., the hanger pin-to-frame nut to 67 ft. lbs., the shackle pin nuts to 67 ft. lbs., the shock absorber bolts to 47 ft. lbs.

NOTE: When installing the U-bolts, tighten the nuts so that the length of the bolts are equal.

Torsion Bars

REMOVAL & INSTALLATION

2WD Pick-Up and Van

These vehicles are equipped with torsion bar front springs.

NOTE: Great care must be taken to make sure springs are not mixed after removal. It is strongly suggested that before removal, each spring be marked with paint, showing front and rear of spring and from which side of the vehicle it was taken. If the springs are installed backwards or on the wrong sides of the vehicle, they could fracture. If replacing the springs, it is not necessary to mark them.

1. Raise and safely support the front of the vehicle.

2. Slide the boot from the rear of torsion bar spring, then paint an alignment mark from the torsion bar spring onto the anchor arm and the torque arm. There are right and left identification marks on the rear end of the torsion bar springs.

3. On the rear torsion bar spring holder, there is a long bolt that passes through the arm of the holder and up through the frame crossmember. Remove the locking nut only from this bolt.

4. Using a small ruler, measure the length from the bottom of the remaining nut to the threaded tip of the bolt and record this measurement.

5. Place a jack under the rear tor-

sion bar spring holder arm and raise the arm to remove the spring pressure from the long bolt. Remove the adjusting nut from the long bolt.

6. Slowly lower jack.

7. Remove the long bolt, the spacers, the anchor arm and the torsion bar spring. The torsion bar should be easily pulled out of the anchor and the torque arms.

NOTE: Inspect all parts for wear damage or cracks. Check the boots for rips and wear. Inspect the splined ends of the torsion bar spring and the splined holes in the rear holder and the front torque arm for damage. Replace as necessary.

To install:

8. Coat the splined ends of the torsion bar with multi-purpose grease.

9. If installing the old torsion bars, perform the following:

a. Slide the front of the torsion bar spring into the torque arm, making sure that the alignment marks are matched.

b. Slide the anchor arm onto the rear of the torsion bar spring, making sure that the alignment marks are matched. Install the long bolt and its spacers.

c. Tighten the adjusting nut so that it is the same length as it was before removal.

NOTE: Do not install the locknut.

10. When installing a new torsion bar spring, perform the following:

a. Raise the front of the vehicle, replace the wheel and tire assembly, place a wooden block (7½ in. high) under the front tire. Lower the jack until the clearance between the spring bumper (on the lower control arm) and the frame is ½ in.

b. Slide the front of the torsion bar spring into the torque arm.

c. Install the anchor arm into the rear of the torsion bar spring, then the long bolt and the spacers. The distance from the top of the upper spacer to the tip of the threaded end of bolt is 0.310–1.100 in. (½ ton vehicles) or 0.430–1.220 in. (¾ ton vehicles).

NOTE: Make sure the bolt and bottom spacer are snugly in the holder arm while measuring.

d. Remove the wooden block and lower the vehicle until it rests on the jackstands.

e. Install and tighten the adjusting nut until the distance from the bottom of the nut to the tip of the threaded end of the bolt is 2.7–3.5 in.

NOTE: Do not install the locknut.

11. Apply multi-purpose grease to the boot lips, then refit the boots to the torque and the anchor arms.

12. Lower the vehicle to the floor and bounce it several times to settle the suspension. With the wheels on the ground, measure the distance from the ground to the center of the lower control arm-to-frame shaft. Adjust the vehicle height using the adjusting nut on the anchor arm. The height should be approximately 10.31 in.

NOTE: If, after achieving the correct vehicle height, the distance from the bottom of the adjusting nut to the top of the threaded end of the long bolt is not within 2.7–3.5 in., change the position of the anchor arm-to-tension bar spring spline and reassemble.

13. Install and torque the locknut on the long bolt to 61 ft. lbs.

NOTE: Make sure the adjusting nut does not move when tightening locknut.

4WD Van

NOTE: Great care must be taken to make sure springs are not mixed after removal. It is strongly suggested that before removal, each spring be marked with paint, showing front and rear of spring and from which side of the vehicle it was taken. If the springs are installed backwards or on the wrong sides of the vehicle, they could fracture. If replacing the springs, it is not necessary to mark them.

1. Raise and safely support the vehicle.

2. Using a piece of chalk, remove the boots, then, matchmark the torsion bar spring, the anchor arm and the torque arm.

3. Remove the locknut.

4. Measure the protruding length of the adjusting arm bolt (from the nut to the end of the bolt).

NOTE: The adjusting arm bolt measurement is used as a reference to establish the chassis ground clearance.

5. Remove the adjusting nut, the anchor arm and the torsion bar spring.

NOTE: When installing the torsion bar springs, be sure to check the left/right indicating marks on the rear end of the springs; be careful not to interchange the springs.

To install:

6. Using molybdenum disulphide lithium base grease, apply a coat to the torsion bar spring splines.

7. If installing a used torsion bar spring, perform the following procedures:

a. Align the matchmarks and install the torsion bar spring to the torque arm.

b. Align the matchmarks and install the anchor arm to the torsion bar spring.

c. Tighten the adjusting nut until the bolt protrusion is the same as it was before.

8. If installing a new torsion bar spring, perform the following procedures:

a. Make sure the upper and lower arms rebound.

b. Install the boots onto the torsion bar spring.

c. Install one end of the torsion bar spring to the torque arm.

d. Install the torsion bar spring onto the opposite end of the anchor arm.

e. Finger tighten the adjusting nut until the adjusting bolt protrudes about 1.570 in.

f. Tighten the adjusting nut until the adjusting bolt protrudes about 2.480 in. (wagon) or 2.400 in. (van).

g. Install the wheel(s) and lower the vehicle. Bounce the front of the vehicle to stabilize the suspension.

9. To adjust the ground clearance, turn the adjusting nut until the center of the cam plate nut (located at the front end of the lower suspension arm) is 10.090 in. (wagon) or 9.940 in. (van) above the ground.

10. After adjusting the ground clearance, torque the locknut to 58 ft. lbs., then, install the boots.

4WD Pick-Up and 4Runner

These vehicles are equipped with torsion bar front springs.

NOTE: Great care must be taken to make sure springs are not mixed after removal. It is strongly suggested that before removal, each spring be marked with paint, showing front and rear of spring and from which side of the vehicle it was taken. If the springs are installed backwards or on the wrong sides of the vehicle, they could fracture. If replacing the springs, it is not necessary to mark them.

1. Raise and safely support the vehicle.

2. Using a piece of chalk, remove the boots. Matchmark the torsion bar spring, the anchor arm and the torque arm.

3. Remove the locknut.

4. Measure the protruding length of the adjusting arm bolt (from the nut to the end of the bolt).

NOTE: The adjusting arm bolt measurement is used as a reference to establish the chassis ground clearance.

5. Remove the adjusting nut, the anchor arm and the torsion bar spring.

NOTE: When installing the torsion bar springs, be sure to check the left/right indicating marks on the rear end of the springs; be careful not to interchange the springs.

To install:

6. Using molybdenum disulphide lithium base grease, apply a coat to the torsion bar spring splines.

7. If installing a used torsion bar spring, perform the following procedures:

a. Align the matchmarks, install the torsion bar spring to the torque arm.

b. Align the matchmarks and install the anchor arm to the torsion bar spring.

c. Tighten the adjusting nut until the bolt protrusion is the same as it was before.

8. If installing a new torsion bar spring, perform the following procedures:

a. Make sure the upper and lower arms rebound.

b. Install the boots onto the torsion bar spring.

c. Install one end of the torsion bar spring to the torque arm.

d. Install the torsion bar spring onto the opposite end of the anchor arm.

e. Finger tighten the adjusting nut until the adjusting bolt protrudes about 1.570 in.

f. Tighten the adjusting nut until the adjusting bolt protrudes about 3.430 in.

g. Install the wheel(s) and remove the jackstands. Bounce the front of the vehicle to stabilize the suspension.

9. To adjust the ground clearance, turn the adjusting nut until the center of the cam plate nut (located at the front end of the lower suspension arm) is about 11.220 in. above the ground.

10. After adjusting the ground clearance, torque the locknut to 61 ft. lbs., then, install the boots.

Upper Ball Joints

INSPECTION

1. Raise the lower control arm and check for excess play.

2. If the ball joints are within specifications and a looseness problem still exists, check the other suspension parts (wheel bearings, tie-rods and etc.).

3. The bottom of the tire should not move more than 0.200 in. when the tire is pushed and pulled inward and outward. The tire should not move more than 0.090 in. up and down.

4. If the play is greater than these figures, replace the ball joint.

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the wheel and tire assembly.

2. Support the lower control arm with a floor jack.

3. Remove the brake caliper and support it out of the way, with a wire.

4. Using a ball joint removal tool, separate the tie-rod end from the knuckle arm.

5. Remove the ball joint-to-control arm mounting bolts and separate the joint from the arm.

6. To install, reverse the removal procedures. Torque the ball joint-to-upper control arm bolts 20 ft. lbs. (2WD Pick-Up), 25 ft. lbs. (4WD Pick-Up) or 22 ft. lbs. (2WD Van), the ball joint-to-lower control arm bolts to 51 ft. lbs. (Pick-Up) or 49 ft. lbs. (Van), and the lower ball joint-to steering knuckle nut to 25 ft. lbs. (4WD Pick-Up), 76 ft. lbs. (2WD Van) or 83 ft. lbs. (4WD Van).

NOTE: Be sure to grease the ball joints before moving the vehicle.

Lower Ball Joint

INSPECTION

1. Raise the lower control arm and check for excess play.

2. If the ball joints are within specifications and a looseness problem still exists, check the other suspension parts (wheel bearings, tie-rods and etc.).

3. The bottom of the tire should not move more than 0.200 in. when the tire is pushed and pulled inward and outward. The tire should not move more than 0.090 in. up and down.

4. The upper ball joint should be replaced if a distinct looseness is felt when turning the ball joint stud with the steering knuckle removed.

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the wheel and tire assembly.

2. Support the lower control arm with a floor jack.

3. Remove the brake caliper and support it out of the way, with a wire.

4. Using a ball joint removal tool, separate the tie-rod end from the knuckle arm.

5. Using a ball joint removal tool, separate the upper ball joint from the steering knuckle.

6. Remove the ball joint-to-control arm mounting bolts and separate the joint from the arm.

7. To install, reverse the removal procedures. Torque the ball joint-to-upper control arm bolts 20 ft. lbs. (2WD Pick-Up), 25 ft. lbs. (4WD Pick-Up) or 22 ft. lbs. (2WD Van), the upper ball joint-to-steering knuckle nut to 80 ft. lbs. (2WD Pick-Up), 105 ft. lbs. (4WD Pick-Up), 58 ft. lbs. (2WD Van) or 83 ft. lbs. (4WD Van).

NOTE: Be sure to grease the ball joints before moving the vehicle.

Upper Control Arm

REMOVAL & INSTALLATION

Pick-Up and 4Runner

1. Raise and safely support the vehicle. Remove the wheel and tire assembly.

2. Using a floor jack, support the lower control arm.

3. Remove the upper ball joint-to-upper control arm nuts/bolts, then, disconnect the upper control arm.

4. Remove the upper control arm-to-chassis bolts and camber adjusting shims and the upper control arm.

NOTE: When removing the camber adjusting shims, be sure to record their location and thickness of shims, so they may be reinstalled in their original positions.

5. To install, reverse the removal procedures. Torque the upper control arm-to-chassis bolts to 72 ft. lbs. and the upper control arm-to-upper ball joint nuts/bolts to 20 ft. lbs. Check and/or adjust the front wheel alignment.

2WD Van

1. Raise and safely support the vehicle. Remove the torsion bar spring.

2. Remove the cool air intake duct.

3. Remove the upper control arm-to-upper ball joint nuts/bolts and separate the upper control arm from the ball joint.

4. Remove the upper control arm-to-chassis bolts and the control arm from the vehicle.

5. To install, reverse the removal

procedures. Torque the upper control arm-to-chassis bolts to 65 ft. lbs. (front) and 112 ft. lbs. (rear), then, the upper control arm-to-ball joint nuts/bolts to 22 ft. lbs. Check and/or adjust the front end alignment.

4WD Van

1. Raise and safely support the vehicle. Remove the torsion bar spring. Lower the vehicle.

2. Remove the front-right seat and the console box. Disconnect the control and shift cables from the shift levers, then, remove the transmission/transfer shifting levers (with retainer).

3. Disconnect the parking brake cable from the brake lever, then, remove the parking brake lever assembly from the vehicle.

4. Disconnect the parking brake cable from the intermediate lever and remove it. Disconnect the shift cable from the transmission and remove it.

5. Remove the seat floor panel.

6. Remove the fan shroud, the radiator mounting bolts/nuts and move it aside; do not drain the coolant. Raise and safely support the vehicle.

7. Remove the shock absorber-to-frame nuts and disconnect the shock absorber from the frame.

8. From the upper ball joint, remove the cotter pin and the nut. Using a ball joint removal tool, press the ball joint from the steering knuckle.

9. Remove the upper control arm-to-chassis bolts and the arm from the vehicle.

10. To install, reverse the removal procedures. Torque the upper control arm-to-chassis bolts to 112 ft. lbs., the upper ball joint-to-steering knuckle nut to 83 ft. lbs.

Lower Control Arm

REMOVAL & INSTALLATION

2WD Pick-Up

1. Raise and safely support the vehicle. Remove the torsion bar spring.

2. Remove the shock absorber, the stabilizer bar and the strut bar from the lower arm.

3. Remove the shock absorber from the lower arm.

4. From the lower ball joint, remove the cotter pin and the nut. Using a ball joint removal tool, press the ball joint from the lower control arm.

NOTE: If the lower ball joint is not to be replaced, simply unbolt it from the lower control arm. It is not necessary to separate the ball joint from the steering knuckle.

5. Remove the lower control arm

shaft nut. Remove the spring torque arm from the other side of the lower control arm, then, remove the lower arm shaft bolt and the lower arm.

6. To install, reverse the removal procedures.

7. Tighten the bolt(s) holding the lower control arm to the frame but do not torque them until the vehicle is on the ground.

8. Torque the ball joint-to-lower control arm nuts/bolts to 51 ft. lbs., the strut bar-to-lower control arm bolts to 70 ft. lbs., the stabilizer bar-to-lower control arm bolts to 9 ft. lbs., the lower shock absorber bolt to 13 ft. lbs., upper shock absorber bolt to 18 ft. lbs. and the lower arm mounting nuts to 166 ft. lbs.

9. Check and/or adjust the front end alignment.

NOTE: Do not torque the control arm bolts fully until the vehicle is lowered and bounced several times; if the bolts are tightened with the control arm(s) hanging, excessive bushing wear will result.

4WD Pick-Up and 4Runner

1. Raise and safely support the vehicle. Remove the shock absorber.

2. Disconnect the stabilizer bar from the lower suspension arm.

3. Remove the lower ball joint-to-lower control arm bolts, then, separate the control arm from the ball joint.

4. Using a piece of chalk, place matchmarks on the front/rear adjusting cams.

5. Remove the nuts and adjusting cams and the lower control arms.

6. To install, reverse the removal procedures. Torque the lower ball joint-to-lower control arm bolts to 20 ft. lbs., the stabilizer bar-to-lower control arm bolts to 19 ft. lbs., the shock absorber-to-lower control arm nut/bolt to 101 ft. lbs.

7. Lower the vehicle to the ground, bounce it a few times, align the matchmarks and torque the adjusting cam nuts to 203 ft. lbs. Check and/or adjust the front wheel alignment.

2WD Van

1. Raise and safely support the vehicle.

2. Remove the stabilizer bar and the strut bar from the lower arm.

3. Remove the shock absorber from the lower arm. If necessary, disconnect the tie-rod end from the steering knuckle.

4. From the lower ball joint, remove the cotter pin and the nut. Using a ball joint removal tool, press the ball joint from the lower control arm.

NOTE: If the lower ball joint is not to be replaced, simply unbolt it from the lower control arm. It is not necessary to separate the ball joint from the steering knuckle.

5. Using a piece of chalk, matchmark the adjusting cam of the lower control arm.

6. Remove the adjusting cam, the nut and the lower control arm.

7. To install, reverse the removal procedures. Align the cam matchmarks and finger tighten the nut. Torque the ball joint-to-lower control arm nuts/bolts to 49 ft. lbs., the lower ball joint-to-steering knuckle nut to 76 ft. lbs., the strut bar-to-lower control arm bolts to 49 ft. lbs., the stabilizer bar-to-lower control arm bolts to 9 ft. lbs., the tie-rod end-to-steering knuckle nut to 43 ft. lbs., the lower shock absorber bolt to 13 ft. lbs., upper shock absorber bolt to 19 ft. lbs. and the adjusting cam nut to 152 ft. lbs. Check and/or adjust the front end alignment.

NOTE: Do not torque the control arm bolts fully until the vehicle is lowered and bounced several times.

4WD Van

1. Raise and safely support the vehicle.

2. Remove the stabilizer bar from the lower control arm.

3. Remove the shock absorber from the lower control arm.

4. From the lower ball joint, remove the cotter pin and the nut. Using a ball joint removal tool, press the ball joint from the lower control arm.

NOTE: If the lower ball joint is not to be replaced, simply unbolt it from the lower control arm. It is not necessary to separate the ball joint from the steering knuckle.

5. Using a piece of chalk, matchmark the adjusting cam of the lower control arm.

6. Remove the adjusting cam, the nut and the lower control arm.

7. To install, reverse the removal procedures. Align the cam matchmarks and finger tighten the nut. Torque the ball joint-to-lower control arm nuts/bolts to 83 ft. lbs., the stabilizer bar-to-lower control arm bolts to 14 ft. lbs., the tie-rod end-to-steering knuckle nut to 43 ft. lbs., the lower shock absorber bolt to 70 ft. lbs. and the adjusting cam nut to 152 ft. lbs. Check and/or adjust the front end alignment.

NOTE: Do not torque the control arm bolts fully until the vehicle is lowered and bounced several times.

REAR SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

Pick-Up, 4Runner and Land Cruiser

1. Raise and safely support the vehicle.
3. Remove the upper shock absorber retaining bolts from the upper frame member.
4. Remove the lower end bolt of the shock absorber from the spring seat.
5. Remove the shock absorber from the vehicle.

NOTE: Inspect the shock for wear, leaks or other signs of damage.

6. To install, reverse the removal procedures. Torque the upper bolt to 19 ft. lbs. (2WD vehicle) or 47 ft. lbs. (4WD vehicle) and the lower bolt to 19 ft. lbs. (2WD vehicle) or 47 ft. lbs. (4WD vehicle).

Van

1. Raise and safely support the vehicle.
2. Remove the shock absorber-to-axle housing bolt.
3. Working inside the vehicle, remove the locknut, the retaining nut, the retainers and the rubber bushings from the top of the shock absorber.

NOTE: When removing the retaining nut, from the top of the shock absorber, it may be necessary to hold the top of the shock to keep it from turning.

4. Remove the shock absorber from the vehicle.
5. To install, reverse the removal procedures. Torque the shock absorber-to-body nut to 16-24 ft. lbs. and the shock absorber-to-axle housing bolt to 27 ft. lbs.

Coil Spring

REMOVAL & INSTALLATION

Van

1. Raise and safely support the vehicle. Support the axle housing with a floor jack. Remove the wheel and tire assembly.

2. Remove the shock absorber-to-axle housing bolt.
3. Remove the stabilizer-to-axle housing bar bushing bracket bolts.
4. Remove the lateral control arm-to-axle housing nut and disconnect the lateral control arm.

5. Lower the floor jack, then remove the coil spring(s) and the insulators.

NOTE: While lowering the axle housing, be careful not to snag the brake line of the parking brake cable.

6. To install, reverse the removal procedures. Torque the shock absorber bolt to 27 ft. lbs., the lateral control arm-to-axle housing nut to 43 ft. lbs. and the stabilizer-to-axle housing bolts to 27 ft. lbs.

NOTE: Before tightening the lateral control arm and the stabilizer nuts/bolts, bounce the vehicle to stabilize the suspension.

Leaf Springs

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Support the axle housing with a

floor jack. Remove the wheel and tire assembly.

2. Lower the floor jack to take the tension off of the spring. Remove the shock absorber mounting nuts/bolts and the shock absorber.

3. Remove the cotter pins and the nuts from the lower end of the stabilizer link. Detach the link from the axle housing.

4. Remove the spring-to-axle housing U-bolt nuts, the spring bumper and the U-bolt.

5. At the front of the spring, remove the hanger pin bolt. Disconnect the spring from the bracket.

6. Remove the spring shackle retaining nuts and the spring shackle inner plate, then carefully pry out the spring shackle with a pry bar.

7. Remove the spring from the vehicle.

To install:

8. To install, perform the following procedure:

a. Install the rubber bushings in the eye of the spring.

b. Align the eye of the spring with the spring hanger bracket and drive the pin through the bracket holes and rubber bushings.

NOTE: Use soapy water as lubricant (if necessary), to aid in pin installation. Never use oil or grease.

c. Finger-tighten the spring hanger nuts/bolts.

d. Install the rubber bushings in the spring eye at the opposite end of the spring.

e. Raise the free end of the spring. Install the spring shackle through the bushings and the bracket.

f. Install the shackle inner plate and finger-tighten the retaining nuts.

g. Center the bolt head in the hole which is provided in the spring seat on the axle housing.

h. Fit the U-bolts over the axle housing. Install the lower spring seat (2WD vehicle) or spring bumper (4WD vehicle) and the nuts.

9. To complete the installation, reverse the removal procedures. Torque the U-bolt nuts to 90 ft. lbs., the hanger pin-to-frame nut to 67 ft. lbs., the shackle pin nuts to 67 ft. lbs., the shock absorber bolts to 47 ft. lbs. (4WD vehicle).

NOTE: When installing the u-bolts, tighten the nuts so that the length of the bolts are equal.

Rear Control Arms

REMOVAL & INSTALLATION

Van

1. Raise and safely support the vehicle. Place a floor jack under the axle housing to support it.

2. Remove the upper control arm-to-body bolt, the upper control arm-to-axle housing bolt and the upper control arm from the vehicle.

3. Disconnect the brake line from the lower control arm.

4. Remove the lower control arm-to-body bolt, the lower control arm-to-axle housing bolt and the lower control arm from the vehicle.

To install:

5. Install the upper control arm to the body and to the axle housing with the nuts. Do not tighten the nuts.

6. Install the lower control arm to the body and to the axle housing with the nuts. Do not tighten the nuts.

7. Remove the jack and the sup-

ports from under the vehicle. Bounce the vehicle to stabilize the suspension.

8. Using the floor jack under the axle housing, raise the vehicle. Place jackstands under the frame but do not let them touch the frame.

9. To complete the installation, torque the upper control arm-to-body bolt to 105 ft. lbs., the upper control arm-to-axle housing bolt to 105 ft. lbs., the lower control arm-to-body bolt to 130 ft. lbs. and the lower control arm-to-axle housing bolt to 105 ft. lbs.

Lateral Control Rod

REMOVAL & INSTALLATION

Van

1. Raise and safely support the vehicle. Place a floor jack under the axle housing and support it.

2. Remove the lateral control rod-to-axle housing nut.

3. Remove the lateral control rod-to-body nut and the control rod from the vehicle.

To install:

4. Raise the axle housing until the frame is just free of the jack.

5. Install the lateral control rod-to-body with the nut. Do not tighten the nut.

6. Install the lateral control rod-to-axle housing in the following order: washer, bushing, spacer, lateral control rod, bushing, washer and nut. Do not tighten the nut.

7. Remove the jack, lower the vehicle to the floor and bounce it to stabilize the suspension.

8. Using the floor jack under the axle housing, raise the vehicle. Torque the lateral control rod-to-body nut to 81 ft. lbs. and the lateral control rod-to-axle housing nut to 43 ft. lbs.

ENGINE ELECTRICAL

NOTE: Disconnecting the battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is disconnected.

Distributor

REMOVAL & INSTALLATION

- 1. Disconnect the negative battery cable.
- 2. Disconnect the connector plug at the distributor. Remove the distributor cap and shield.
- 3. Rotate the engine so that the rotor points to the No. 1 spark plug wire tower on the distributor cap and the timing marks are aligned at 0. Matchmark the rotor-to-distributor. Also, matchmark the distributor housing to engine relationship.
- 4. Remove the distributor mounting bolt and lift off the retaining

- flange. Lift the distributor straight out of the engine.
- 5. If the engine has not been rotated while the distributor was out, reinstall the distributor in the reverse order of removal. Align the matchmarks made during removal and adjust the ignition timing.
 - 6. If the engine has been rotated while the distributor was out, proceed as follows:
 - a. Rotate the engine until the No. 1 cylinder is at TDC on the compression stroke and align the timing

- marks on 0. Align the matchmarks and insert the distributor into the engine.
- b. If the oil pump driveshaft does not engage, remove the distributor and turn the pump shaft so that it is parallel to the center line of the crankshaft.
- c. Install the distributor, aligning the marks and reconnect the wiring.
- d. Install the distributor cap.
- e. Run the engine and adjust the ignition timing.

Removing the distributor shaft using a puller

Distributor assembly - exploded view

Distributor Driveshaft

REMOVAL & INSTALLATION

1. Rotate the engine until No. 1 cylinder is at TDC on the compression stroke. Align the timing marks at 0.
2. Matchmark and remove the distributor.
3. Remove the spacer spring from the driveshaft.
4. Turn the shaft slowly to the left while withdrawing it from its bore.

NOTE: An extractor tool, 0.583–0.782 in. in diameter must be installed into the driveshaft in order to remove it.

5. Carefully, remove the washer under the shaft.

To install:

6. To install, make sure that the engine is at TDC on the compression stroke for No. 1 cylinder with the timing marks aligned at 0. Make sure the rotor is pointing to the No. 1 cylinder mark on the edge of the distributor housing.

7. Install the washer on the shaft and insert the shaft into the bore.

NOTE: Due to the slant of the teeth on the drive gears, the shaft must be rotated slightly to the left when it is inserted into the crankcase.

8. When the shaft is properly inserted in the engine, the slot should be about 12 degrees out of parallel with the center line of the engine and the slot offset should be facing outside the engine.

NOTE: Insert the shaft so that the offset slot in the top of the driveshaft is pointing toward the tapped hole in the crankcase. The small segment points toward the water pump.

9. Reinstall the spacer spring.
10. Install the distributor and adjust the ignition timing.

Ignition Timing

ADJUSTMENT

1. Run the engine until it reaches normal operating temperature.
2. Disconnect the temperature sensor II connector.
3. Connect a timing light and tachometer. Start the engine and raise the idle speed to 2000–2500 rpm.
4. Allow the engine to settle at idle. Aim the timing light at the crankshaft pulley.
5. Loosen and rotate the distributor to adjust the ignition timing. When

Timing mark location—on triple pulley

Disconnect the temperature sensor (arrow)

the timing is correct, tighten the distributor clamp and recheck the timing.

6. Turn the engine off and reconnect the temperature sensor II connector. Reset the idle speed.

Alternator

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

BELT TENSION ADJUSTMENT

1. Loosen the alternator pivot and mounting bolts.
2. Pivot the alternator to adjust the belt tension.
3. The correct tension is measured using the deflection method. The deflection should be 10–15mm.
4. After the tension is adjusted, tighten the mounting and pivot bolts to 14 ft. lbs.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Disconnect the alternator wiring at the voltage regulator and alternator.
3. Remove the dipstick and oil filler neck.
4. Loosen the alternator adjusting bolt and remove the drive belt.

5. Remove the right rear engine cover plate and alternator cover plate.
6. Remove the mounting bolt and remove the alternator from above.
7. Installation is the reverse of the removal procedure. Use care to ensure that the rubber grommet on the intake cover for the wiring harness is installed correctly.
8. After installation, adjust the drive belt tension.

Starter

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Disconnect and tag the wiring at the starter.
3. Remove the upper starter mounting bolt through the engine compartment.
4. Raise and support the vehicle safely.
5. Remove the lower starter mounting bolt and remove the starter.

To install:

6. Before installing the starter, lubricate the outboard bushing in the nose with grease. Apply sealing compound to the mating surfaces between the starter and transaxle.
7. Locate the starter on the transaxle housing and install the lower mounting bolt.
8. Lower the vehicle and install the upper mounting bolt.
9. Connect the starter wiring and battery cable.

CHASSIS ELECTRICAL

Heater Blower Motor

REMOVAL & INSTALLATION

Front

1. Disconnect the negative battery cable.
2. Drain the cooling system, using the following procedures:
 - a. Open the heater controls.
 - b. Open the expansion tank cap.
 - c. Position a catch pan under the water pump.

d. Disconnect the lower coolant hose from the water pump connection pipe and the center coolant hose from the water pump.

e. Drain the system to a level below the heater core.

3. Disconnect the electrical and vacuum cables from the center heater unit, under the instrument panel. Disconnect the air ducts from the housing.

4. Remove the heater housing mounting bolts and remove the housing from under the instrument panel.

5. Remove the top cover and remove the blower from the housing.

To install:

6. Install the blower motor in position in the housing and install the cover.

7. Install the heater assembly in position under the instrument panel.

8. Connect the electrical wires and the vacuum lines to the housing. Connect the air ducts to the housing.

9. Connect the negative battery cable and fill the cooling system. Run the engine at 2500 rpm and check that water flows at the breather valve with no bubbles.

10. Check the operation of the blower motor.

Auxiliary Blower

1. Disconnect the negative battery cable.

2. Remove the kick panel from under the rear seat.

3. Remove the 4 bolts retaining the auxiliary heater unit to the floor.

4. Pivot the heater unit outward, do not disconnect the heater hoses or the cables from the housing.

5. Disconnect the blower electrical lead and remove the blower from the housing.

6. Installation is the reverse of the removal procedure.

7. Check the operation of the blower.

Windshield Wiper Motor

REMOVAL & INSTALLATION

1. Place the wiper arms in the park position.

2. Disconnect the negative battery cable.

3. Remove both wiper arms.

4. Remove the glove compartment.

5. Remove the bearing cover and nut from the motor.

6. Remove the heater branch connections under the instrument panel.

7. Disconnect the wiper motor wiring.

8. Remove the wiper motor mounting screws and remove the motor.

Typical heater assembly

To install:

9. Install the wiper motor in position under the instrument panel.

10. Install the bearing cover and nut to the motor.

11. Install the fresh air ducts and reconnect the wiring.

12. Install the glove compartment.

13. Install the wiper arms and connect the negative battery cable.

14. The wiper blades should be 2 $\frac{3}{4}$ in. (70mm) from the bottom of the windshield, when correctly installed.

Windshield Wiper Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Matchmark and remove the steering wheel.

3. Disconnect the combination switch wiring and remove the combination switch.

4. Disconnect the wiper switch wiring and remove the wiper switch.

5. Installation is the reverse of the removal procedure.

6. Align the steering wheel matchmarks during installation.

Instrument Cluster

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Grasp the rear of the instrument

Instrument cluster—exploded view

cluster cover, by the 2 recesses, and pull the cover off.

3. Remove the 2 screws retaining the instrument cluster and pull it forward.

4. Disconnect the speedometer cable from the EGR counter and remove the cluster from the vehicle.

5. All instruments can be removed from the rear of the cluster.

6. Installation is the reverse of the removal procedure.

Radio

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

NOTE: On vehicles equipped with the Heidelberg 5 stereo system, disconnecting the battery cable will cause the radio to lock. This is a function of the built in security of the radio. The radio must be unlocked with a special code that is given to the owner at the time of purchase. If the code is not entered, the radio will not function.

2. Remove the radio knobs and remove the retaining nuts from the shafts.

3. Remove the radio from the instrument panel and disconnect the electrical leads from it.

4. If equipped with the Heidelberg 5 stereo system, the radio must be pulled from the instrument panel using special tools VW-160 or equivalent. Insert the tools in each of the set of holes on the sides of the radio and pull the radio out of the instrument panel.

5. Disconnect the electrical and antenna leads from the radio.

6. Installation is the reverse of the removal procedure.

Combination Switch

REMOVAL & INSTALLATION

The combination switch incorporates the headlight, turn signal, dimmer and cruise control switches.

Combination switch mounting

1. Disconnect the negative battery cable.
2. Matchmark and remove the steering wheel.
3. Pry off the switch cover on the end of the steering column.
4. Disconnect and tag the switch wiring.
5. Remove the switch mounting screws and remove the switch from the steering column.
6. Installation is the reverse of the removal procedure.
7. Align the steering wheel matchmarks during installation. Tighten the steering wheel retaining nut to 36 ft. lbs. (50 Nm).

Ignition Lock/Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the ignition switch.
3. With the key in the cylinder and turned to the ON position, pull the lock cylinder out far enough so the securing pin can be depressed through a hole in the side of the lock cylinder housing.
4. As the pin is depressed, gently push the cylinder into its housing.
5. Make sure the pin engages correctly and that the retainer fits easily in place. Do not force any parts together. When they are correctly aligned, they will fit easily together.
6. Installation is the reverse of the removal procedure.

Stoplight Switch

REMOVAL & INSTALLATION

The stoplight switch is located in the side of the master cylinder.

1. Disconnect the negative battery cable.

Dimensions for drilling the Ignition lock cylinder

2. Remove the instrument cluster cover.
3. Remove the instrument cluster from the vehicle.
4. Disconnect the electrical lead from the stoplight switch.
5. Place a rag under the stoplight switch. Remove the switch and quickly plug the opening in the master cylinder.

NOTE: It is important that the switch opening be plugged immediately, to prevent the brake fluid from leaking out and to protect the interior trim components from damage.

To install:

6. Install the switch into the master cylinder and reconnect the electrical lead.
7. Fill the master cylinder to the correct level.
8. Install the instrument cluster and cover.
9. Connect the negative battery cable.
10. Check the operation of the switch and the operation of the brake system.

Fuses and Circuit Breakers

LOCATION

The fuse box is located behind a panel, under the left side of the instrument panel. The panel can be removed by lifting it from the bottom and pulling it upward. The fuse ratings and circuits protected are listed on the fuse box cover.

ENGINE COOLING

Radiator

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Drain the cooling system.
2. Remove the grille retaining screws and remove the grille.
3. Raise and safely support the vehicle.
4. Remove the spare tire from the spare tire tray and remove the spare tire tray bracket.
5. Remove the lower radiator cover.
6. Disconnect the hoses from the radiator and remove the radiator lower bolts.

NOTE: If equipped with air conditioning, the system does not

have to be discharged. The condenser can be lowered with the radiator and supported aside.

7. Lower the radiator partially and disconnect the electrical lead from the thermo-time switch.

8. Carefully remove the radiator from the vehicle. If equipped with air conditioning, use care not to kink the refrigerant lines. Remove the condenser-to-radiator bolts and support the condenser aside.

To install:

9. If equipped with air conditioning, attach the condenser to the radiator.
10. Raise the radiator assembly into position and install the lower retaining bolts. Tighten to 11 ft. lbs. (15 Nm).
11. Connect the electrical lead to the thermo-time sensor.
12. Connect the hoses to the radiator. Install the lower radiator cover.
13. Install the spare tire tray bracket and tire. Lower the vehicle.
14. Install the grille assembly. Connect the negative battery cable.
15. Fill and bleed the cooling system.

Electric Cooling Fan

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the grille assembly.
3. Raise and safely support the vehicle.
4. Remove the spare tire and spare tire bracket.
5. Lower the radiator from the vehicle, it is not necessary to disconnect the hoses from the radiator or to drain the coolant. Support the radiator assembly aside.
6. Disconnect the fan electrical lead and remove the fan retaining bolts.
7. Remove the fan from the vehicle.
8. Installation is the reverse of the removal procedure. Check the operation of the fan.

Heater Core

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Drain the cooling system.
3. Locate and remove the heater core cover in the side of the heater box.
4. Disconnect the heater hoses from the heater core.

NOTE: It may be necessary to remove the heater box from the vehicle. If so, disconnect and tag the wiring and cables at the heater box.

Water pump assembly—exploded view

5. If the unit has a core cover on the side, remove the screws or unclip the cover and remove the core. The core should pull straight out.

6. If the heater box is separated in halves, remove the heater box clips that hold the halves of the heater box together. Separate the halves and remove the heater core.

7. Installation is the reverse of the removal procedure.

8. Fill the cooling system and check the operation of the heater when finished.

9. If the heater box was removed, check the heater controls to insure that there is full travel with the controls.

surfaces of the water pump and engine.

7. Lightly grease the O-ring and install the water pump on the engine.

8. Torque the bolts to 15 ft. lbs.

9. Install the left side coolant elbow with a new O-ring and torque the bolts to 15 ft. lbs.

10. Install the right side coolant elbow with a new O-ring and torque the bolts to 15 ft. lbs.

11. Install the drive belt pulley and torque the retaining bolts to 15 ft. lbs. Install the drive belt. Adjust the belt tension.

12. Fill the cooling system, run the engine and check for leaks.

Water Pump

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Drain the cooling system. Loosen the water pump pulley bolts.

2. Remove the drive belt and pulley from the water pump.

3. Disconnect the coolant hoses and remove the left side coolant elbow from the water pump.

4. Remove the right side coolant elbow from the pump.

5. Remove the water pump.

To install:

6. Clean and inspect the mounting

Thermostat

REMOVAL & INSTALLATION

The thermostat is mounted in the top of the coolant distribution housing, above the water pump.

1. Disconnect the negative battery cable.

2. Drain the coolant from the engine.

3. Remove the hoses from the top of the housing.

4. Remove the housing top retaining bolts and remove the top from the housing.

5. Remove the thermostat from the housing.

To install:

6. Replace the O-ring in the top of the thermostat housing.

7. Install the thermostat in position and install the top of the housing.

8. Tighten the retaining bolts to 15 ft. lbs. Connect the hoses and refill the cooling system.

9. Connect the battery cable and bleed the cooling system.

BLEEDING THE COOLING SYSTEM

NOTE: The manufacturer specifies the use of a specially-formulated coolant, part no. ZVW 237 102 in this engine. Anti-freeze other than this may cause corrosion of the cooling system, leading to engine damage.

1. Set the heater control to **MAX** heat.

2. Open the control valve for the auxiliary heater under the rear seat.

3. Remove the radiator grille.

4. Raise and safely support the vehicle approximately 15 3/4 in. at the front, under the crossmember.

5. Open the bleeder screw on the radiator.

6. Open the bleeder valve in the engine compartment.

7. Fill the coolant expansion tank until the tank is full.

8. Start the engine. Increase the engine speed to 2000 rpm and continue to fill the tank until coolant flows from the bleeder screw on the radiator. Wait until the coolant flowing is free of bubbles.

9. Add more coolant until the tank is full. Close the tank cap.

10. Turn the engine **OFF**. Restart the engine after 20 seconds.

11. At 2000 rpm, open the expansion cap.

12. Close the bleeder screw on the radiator when coolant flows out. Add coolant if necessary and close the tank cap.

13. Close the bleeder screw in the engine compartment and turn **OFF** the engine. If necessary, check and fill the expansion tank.

FUEL SYSTEM

Fuel System Service Precaution

When working with the fuel system certain precautions should be taken; always work in a well ventilated area,

keep a dry chemical (Class B) fire extinguisher near the work area. Always disconnect the negative battery cable and do not make any repairs to the fuel system until all the necessary steps for repair have been reviewed.

RELIEVING FUEL SYSTEM PRESSURE

1. Connect an fuel pressure gauge, VW-1318 or equivalent to the pressure fitting at the fuel pressure regulator.
2. Use the switch on the gauge assembly to slowly release the pressure.
3. Disconnect the gauge assembly.

Fuel Filter

REMOVAL & INSTALLATION

The fuel filter is located under the right front side of the vehicle, just behind the fuel tank.

1. Relieve the fuel system pressure.
2. Raise and safely support the vehicle.
3. Disconnect the fuel lines from the filter.
4. Remove the filter bracket retaining bolt and remove the filter.
5. Install the new filter in position, note the direction of the arrows for fuel flow.
6. Reconnect the fuel lines and lower the vehicle.
7. Lower the vehicle. Run the engine and check for leaks.

Electric Fuel Pump

PRESSURE TESTING

1. Connect fuel pressure gauge VW-1318 or equivalent, to the pressure fitting at the fuel pressure regulator.
2. Run the engine at idle and check the pressure reading. The pressure should be 29 psi. with the vacuum line connected to the regulator and 36 psi. with the vacuum line disconnected.
3. Shut off the engine and wait 10 minutes. If the value is not maintained; check the fuel pump by clamping off the line from the fuel pump to

Fuel pump location

the regulator and observing the gauge. Check the pressure regulator by clamping off the return line to the fuel tank and observing the gauge and check the injectors by clamping the lines from the injectors to the regulator.

4. If the pressure drop stops or slows down the problem is in the tested component.

ADJUSTMENT

1. Electric fuel pump pressure is 29 psi.
2. Fuel pump pressure is determined by a pressure regulator which diverts part of the fuel pump output to the gas tank when 29 psi is reached.
3. The regulator, located on the engine firewall, has a screw and locknut on its end.
4. Loosen the locknut and adjust the screw to adjust the pressure.
5. Do not force the screw in or out if it does not turn.

REMOVAL & INSTALLATION

1. Relieve the fuel system pressure. Disconnect the negative battery cable.
2. Raise and safely support the vehicle. Disconnect the fuel pump wiring. Pull the plug from the pump, but do not pull on the wiring.
3. Disconnect and plug the fuel hoses.
4. Remove the fuel pump mounting nuts and remove the pump.
5. Reconnect the fuel pump hoses and wiring.
6. Install the pump on the vehicle.

Fuel Injection

IDLE SPEED ADJUSTMENT

1. Run the engine until it reaches normal operating temperature. Turn OFF all electrical accessories including the radiator fan. Check that the throttle valve switch is in the closed position at idle. The crankcase breather hose should be removed from the oil vent and plugged. Check to see that the idle stabilizer is operating properly. With the ignition turned ON, the valve should vibrate.
2. Connect the tester, VW tool VAG 1367 or equivalent. Using adapter VW 1473, connect the tester VW 1473 or equivalent to the No. 1 terminal of the ignition coil.
3. Connect the CO meter to the left side exhaust pipe.
4. With the ignition switched OFF, disconnect the oxygen sensor connector and the idle stabilizer control valve connector.
5. Run the engine at idle speed. Af-

ter 2 minutes adjust as necessary by turning the adjusting screw on the throttle valve housing. The idle speed should be 880 ± 50 rpm.

6. Check the CO and adjust as necessary. The CO should be 0.3–1.1%. If the CO% is above this level use the following procedures.

7. Stop the engine. To adjust the CO, first remove the screw caps. Center punch the plug in the CO adjusting hole. Drill a $\frac{3}{32}$ in. hole in the center of the plug, $\frac{9}{64}$ – $\frac{5}{32}$ in. deep. Keep the area clean of metal shavings.

8. Screw a sheet metal screw into the plug and remove the plug by pulling upwards.

9. Start the engine and set the idle speed to 880 ± 50 rpm and the CO content to 0.7% by alternately turning the adjusting screws to obtain the correct specifications.

10. Reconnect the oxygen sensor connector and idle stabilizer connec-

CO meter test connection

Oxygen sensor (1) and Idle stabilizer (2) connection locations

(1) Idle speed adjustment screw and (2) idle mixture adjustment screw locations

tor. Let the engine idle for approximately 2 minutes. Check the CO content and correct if necessary by repeating the above procedure.

11. Stop the engine. Install a new plug until it is flush with the intake air sensor.

Fuel Injector

REMOVAL & INSTALLATION

1. Relieve the fuel system pressure.
2. Disconnect the negative battery cable.
3. Remove the electrical connector from the injector.
4. Disconnect the fuel line from the injector.
5. Pull the injector from its bore.
6. Using a new O-ring, install the injector in position.
7. Connect the fuel line and electrical lead.
8. Connect the negative battery cable. Check for leaks around the injector base and at the fuel line.

EMISSION CONTROLS

Please refer to "Emission Control" in the Unit Repair section for system maintenance procedures. Due to the complex nature of modern electronic engine control systems, comprehensive diagnosis and testing procedures fall outside the confines of this repair manual. For complete information on diagnosis, testing and repair procedures concerning all modern engine and emission control systems, please refer to "Chilton's Guide to Electronic Engine Controls".

Emission Warning Lamps

RESETTING

The emission systems incorporates a mileage counter which activates the oxygen sensor warning light on the instrument panel. The counter will illuminate the light at 60,000 mile intervals. The oxygen sensor must be replaced when the light comes on.

The light can reset by locating the counter under the left front dash of the vehicle and depressing the reset button on it.

Mileage counter assembly—press button to reset

ENGINE MECHANICAL

NOTE: Disconnecting the battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is disconnected.

Engine

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the air cleaner from the air flow sensor and air intake duct.
3. Disconnect and tag the alternator wires at the alternator.
4. Disconnect and tag the connectors at the fuel injectors, the plug at the throttle valve switch and the plug at the auxiliary air regulator.
5. Disconnect and tag the hoses at the charcoal filter valve.
6. Disconnect and plug the fuel hoses near the distributor. Remove the accelerator cable from the throttle valve lever. On automatic transaxle equipped vehicles, remove the circlip and spring from the accelerator rod.
7. Disconnect and tag the connector at the oxygen sensor, the distributor, oil pressure switch, temperature sensor, temperature sender and coolant level warning switch (located at the coolant expansion tank).

8. Plug the coolant hoses and open the coolant expansion tank cap. Remove the drain plugs at the cylinder heads and drain the coolant.

NOTE: Always replace the sealing rings underneath the drain plugs during installation.

9. Disconnect the brake booster line

and all coolant hoses. Remove the coolant expansion tank.

10. Raise and support the vehicle safely. Remove the engine-to-transaxle bolts and nuts on both sides.

11. On automatic transaxle equipped vehicles, remove the bolts which attach the torque converter to the drive plate through the hole on the top of the transaxle housing.

12. Disconnect and tag the starter motor wiring.

13. On automatic transaxle equipped vehicles, disconnect the accelerator rod.

14. The vehicle must be raised and safely supported, to remove the engine from under the vehicle.

15. Remove the engine mounting plates from underneath.

16. Loosen the transaxle mounting bolt.

17. Support the underside of the engine.

Engine carrier bolts positioned at the top of their elongated holes

Checking the position of the engine carrier

Shift linkage coupling location

18. Remove the engine carrier bolts. Carefully lower the engine and transaxle assembly slightly. Keep the wiring harness aside so that it can pass the oil filler tube. Lower the assembly more, to have access to the lower engine mounting bolts. Remove the engine from the transaxle and lower it out of the vehicle.

To install:

19. Check the clutch release bearing for wear and replace if necessary.

20. Lubricate the clutch release bearing and main shaft splines lightly with grease. Do not lubricate the guide sleeve for the release bearing.

21. Raise the engine and transaxle assembly into position. Install the transaxle mounting bolts. Tighten to 22 ft. lbs. Install the mounting bolts for the engine carrier, make sure they are correctly positioned at the top of their holes.

22. Install the torque converter bolts on automatic transaxle equipped vehicles.

23. Connect the accelerator rod and the wiring to the starter. Install the coolant expansion tank and reconnect all coolant lines.

24. Reconnect all electrical leads on the engine. Reconnect all of the fuel lines to the injectors and the fuel pressure regulator.

25. Connect the wiring to the alternator and install the air cleaner assembly.

26. Connect the negative battery cable. Refill the cooling system, using the correct procedure.

27. Run the engine to normal operating temperature and check for leaks. Check the idle speed and transmission operation.

Cylinder Head

REMOVAL & INSTALLATION

NOTE: It is not necessary to remove or lower the engine to remove the cylinder heads. Either head can be removed and installed while the engine is in place in the vehicle.

Cylinder head bolt torque sequence

1. Relieve the fuel system pressure. Disconnect the negative battery cable.

2. Drain the coolant from the cooling system using the coolant drain plugs on the bottom of each cylinder head.

3. Install new sealing rings and re-install the drain plugs.

4. Remove the valve cover and gasket.

5. Remove the rocker arm assembly.

6. Unbolt the intake manifold from the cylinder head. The cylinder head is held in place by 8 studs. The cylinder head also holds the cylinders in place, it will be necessary to hold the cylinders in place after the head is removed.

7. After the rocker arm cover, rocker arm retaining nuts and rocker arm assemblies have been removed, the cylinder head nuts can be removed and the cylinder head lifted off.

8. Before installing the head, make sure all gasket contact areas are completely clean and free of any damage. Apply a thin bead of sealing compound to the gasket surface facing the cylinder head.

To install:

9. The pushrod tubes should be installed so that the small end faces the cylinder head and so that the seam on the tube is facing upward. Guide the tubes into the hydraulic lifter holes carefully. Always replace the sealing rings.

NOTE: If the pushrod tube rests on the edge of the valve lifter, the basic valve setting will be incorrect and the lifter(s) will be damaged when the engine is started.

10. Install the cylinder head. Coat the cylinder head cap nuts with sealer. Tighten stud No. 1 cap nut just enough so that the remaining 7 cap nuts can be installed.

11. Torque all nuts in sequence to the correct torque.

12. Complete the installation in the reverse order of the removal procedures.

13. Torque the rocker shaft nuts to 18 ft. lbs. Use new rocker cover gaskets.

14. Connect the negative battery cable. Fill the cooling system, run the engine and check for leaks.

Valve Lash

ADJUSTMENT

NOTE: No routine valve adjustment is necessary however; the valves must still be adjusted whenever the cylinder heads have been removed. The rocker arms in

the Vanagon engines are equipped with conventional lock-nut-type adjusters.

1. Disconnect the negative battery cable. Remove the rocker arm covers. Unscrew the adjusting screws on the rocker arms so that the ball shaped end is flush with the surface of the rocker arm.

2. Rotate the crankshaft until No. 1 cylinder is at TDC on compression. Both valves should be closed and the mark on the distributor rotor should be in line with the mark on the distributor housing.

3. Turn the adjusting screws in so that they just touch the valve stems.

4. Turn the adjusting screws 2 turns clockwise and tighten the locknuts.

5. Rotate the crankshaft 180 degrees and adjust cylinder No. 2. Repeat the procedure on cylinders 3 and 4 until all valves are adjusted.

6. Install the rocker covers. Connect the negative battery cable.

Rocker Arms/Shfts

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Pull the clip that retains the rocker cover over the cover and remove the cover.

2. Remove the rocker arm retaining nuts, rocker arm shaft and the rocker arms. Remove the stud seals.

3. Before installing the rocker arm assembly, be sure that the parts are as clean as possible.

4. Install new stud seals. Install the rocker arm assembly, the slot on the rocker shaft support faces upward.

5. Tighten the retaining nuts to 18 ft. lbs.

6. Make sure that the ball ends of the pushrods are centered in the sockets of the rocker arms.

7. Adjust the valve clearance.

8. Install the rocker cover using a new gasket. Connect the negative battery cable.

Intake Manifold

REMOVAL & INSTALLATION

1. Relieve the fuel system pressure. Disconnect the negative battery cable. Remove the air cleaner.

2. Remove the pressure switch which is mounted under the right pair of intake manifold pipes. Disconnect the injector wiring.

3. Disconnect the fuel lines to the injectors and remove the fuel injectors.

4. Disconnect the hoses from the intake air distributor to the manifold pipes.

5. Remove the manifold retaining nuts. Remove the manifold from its mounting.

To install:

6. Using new gaskets, install the manifold in position on the cylinder head.

7. Tighten the intake manifold bolts to 15 ft. lbs. (20 Nm).

8. Connect the hoses from the intake air distributor to the manifold pipes.

9. Install the injectors, using new O-rings. Reconnect the fuel and electrical leads to the injectors.

10. Install the pressure switch to the right manifold.

11. Connect the negative battery cable.

12. Run the engine and check for leaks.

Intake Air Distributor

REMOVAL & INSTALLATION

The intake air distributor is located at the center of the engine at the junction of the intake manifold pipes. The throttle valve housing and the air inlet pipes are connected to it.

NOTE: It is not necessary to remove the distributor if only the manifold pipes are to be removed.

1. Disconnect the negative battery cable. Relieve the fuel system pressure. Remove the air cleaner and pressure switch which are located under the right pair of manifold pipes.

2. Push the 4 rubber hoses onto the intake manifold pipes and away from the intake air distributor.

3. Remove the accelerator cable and the throttle valve switch.

4. Disconnect the accelerator cable.

5. Disconnect and tag the leads to the ignition distributor and the pressure sensor.

6. Disconnect the vacuum hose at the auxiliary air regulator.

7. Remove the retaining bolts and remove the throttle valve housing from the crankcase.

To install:

8. Install the air intake distributor in position on the crankcase.

9. Connect the vacuum hoses and auxiliary air regulator. Connect the distributor electrical leads.

10. Connect the accelerator cable and the throttle valve switch.

11. Reposition the rubber hoses from the intake pipes to the air distributor.

12. Install the pressure switch and the air cleaner.

Exhaust system components

13. Connect the negative battery cable. Check the operation of the accelerator cable and adjust the idle as needed.

Exhaust Manifold

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and support the vehicle safely. Remove the rear wheel and tire assemblies.

2. Remove the catalytic converter to muffler clamps and bolts.

3. Support the converter/tail pipe assembly and remove the converter to exhaust manifold bolts. Remove the converter.

4. Remove the exhaust manifold to pre-heat pipe bolts.

5. Support the manifold and remove the manifold supporting clamp bolt.

6. Remove the exhaust manifold from the engine.

7. To install, always use new gaskets and O-rings.

8. Installation is the reverse of the removal procedure.

9. Run the engine and check for exhaust leaks.

Crankcase

DISASSEMBLY AND ASSEMBLY

1. Relieve the fuel system pressure.
2. Disconnect the negative battery cable.

3. Remove the engine and position it in a suitable holding fixture.

4. Remove the intake and exhaust manifolds. Remove the cylinder heads, cylinders and pistons.

5. Remove the oil strainer, oil pressure switch and crankcase nuts. Remove the flywheel and oil pump. Matchmark the flywheel so that it can be replaced in the same position.

6. Keep the cam followers in the right crankcase half in position by using a retaining spring.

7. Use a rubber hammer to break the seal between the crankcase halves.

NOTE: Never insert sharp metal tools, wedges, or any prying device between the crankcase halves.

8. After the seal between the crankcase halves is broken, remove the right-hand crankcase half, crankshaft

Crankcase assembly—exploded view

oil seal and the camshaft can now be lifted out of the crankcase half.

9. Remove the cam followers, bearing shells and oil pressure relief valve.

10. Before starting reassembly, check the crankcase for any damage or cracks.

11. Flush and blow out all oil passages. Check the studs for tightness.

12. Install the crankshaft bearing dowel pins and bearing shells for the crankshaft and camshaft. Make sure that the bearing shells with thrust flanges are installed in the proper journal.

13. Install the crankshaft and camshaft after the bearings have been well lubricated. When installing the camshaft and crankshaft, make sure that the timing marks on the timing gears are aligned.

14. Install the oil pressure relief valve.

15. Lubricate and install the cam followers.

16. Install the camshaft end plug using sealing compound.

17. Install the thrust washers and crankshaft oil seal. The oil seal must rest squarely on the bottom of its recess in the crankcase. The thrust washers at the flywheel end of the crankshaft are shims used to set the crankshaft endplay.

18. Spread a thin film of VW AMV 188-000-02 or equivalent, sealing compound on the crankcase joining faces and place the halves together. Torque the nuts in several stages. Tighten the 8mm nut located next to the 122mm stud of the No. 1 crankshaft bearing first. As the crankcase halves are being torqued, continually check the crankshaft for ease of rotation.

19. Crankshaft end-play is checked when the flywheel is installed. It is adjusted by varying the number and thickness of the shims located behind the flywheel. Measure the end-play with a dial indicator mounted against the flywheel and attached firmly to the crankcase.

20. Install the cylinders and pistons. Install the cylinder heads.

21. Install the intake and exhaust manifolds.

22. Install the engine in the vehicle. Connect the negative battery cable.

2. Disconnect the negative battery cable.

3. Remove the engine from the vehicle and position it in a suitable holding fixture.

4. Remove the intake and exhaust manifolds. Remove the cylinder heads, cylinders and pistons.

5. Disassemble the crankcase.

6. Remove the camshaft and timing gear from the case.

To install:

7. Before reinstalling the camshaft, it should be checked for wear on the lobe surfaces and on the bearing surfaces. In addition, the riveted joint between the camshaft timing gear and the camshaft should be checked for tightness.

Camshaft and Timing Gear

REMOVAL & INSTALLATION

1. Relieve the fuel system pressure.

Align the timing marks on the gears

8. The camshaft should be checked for a maximum run-out of 0.0015 in.

9. The timing gear should be checked for the correct tooth contact and for wear.

10. If the camshaft bearing shells are worn or damaged, new shells should be fitted. The camshaft bearing shells should be installed with the tabs engaging the notches in the crankcase. Before installing the camshaft, the bearing journals and cam lobes should be generously coated with oil.

11. When the camshaft is installed, care should be taken to ensure that the timing gear tooth marked **0** is located between the teeth of the crankshaft timing gear marked with a center punch.

12. Coat the camshaft end cap with sealant and make sure it is installed in its original position.

13. The camshaft endplay is measured at the No. 3 bearing on all engines. Endplay is 0.0015–0.005 in. (0.04–0.12mm) and the wear limit is 0.006 in. (0.16mm).

14. Assemble the crankcase and install the cylinders, pistons, cylinder heads, intake and exhaust manifolds.

15. Install the engine in the vehicle. Connect the negative battery cable.

Pistons and Cylinders

REMOVAL & INSTALLATION

1. Relieve the fuel system pressure.
2. Disconnect the negative battery cable.

3. Remove the engine from the vehicle and position it in a suitable holding fixture. Remove the intake and exhaust manifolds.

4. Remove the cylinder head(s) and pushrod tubes.

5. Matchmark the tops of each piston to its respective cylinder liner. Pistons and liners must be installed in the same locations. Note the boss on the inner side of each liner.

6. Set the piston to be removed at TDC. Using tool 3092 or an equivalent sleeve puller, pull out the cylinder until the piston pin circlip is visible through the coolant passage on the drive belt side of the engine. Remove the circlip.

7. To remove the sleeve, remove the circlip on the flywheel side. Remove the wrist pin through the same coolant passage using wrist pin puller no. 3091 or equivalent.

8. The cylinder block can be removed after the second piston on each side of the crankcase is removed. The block slides off of the cylinder block cylinder head studs which protrude

Cylinder and piston assemblies

Removing the cylinder using a puller

from the crankcase.

To install:

9. Make sure the cylinder block-to-crankcase mating surfaces are clean. Install the cylinder block onto the crankcase.

10. The sealing rings on the top and bottom sides of the cylinder liners must always be replaced. The cylinder head end ring is a thin green ring and the crankcase end ring is thick and black in color.

11. Lubricate the piston and liner bore with clean engine oil. Install the piston into the cylinder sleeve. The arrow on the piston faces the flywheel side of the engine. The gap on the oil scraper ring must be to the top and the piston ring gaps must be offset by 180 degrees. Install the flywheel-side wrist pin circlip into the piston.

12. Obtain a connecting rod support tool 3090 or equivalent. Note the markings on the tool; R is the right side of the engine, L is the left side of the engine.

13. Push the connecting rod support onto the center stud so that the finger of the tool supports the connecting rod, then secure it with a rubber band to prevent it from slipping. Align the connecting rod so that the piston wrist pin can be installed through the same coolant passage from which it was removed. The crankshaft must be at TDC and the lug on the rod faces UP.

14. Install the piston/sleeve assembly.

15. The piston should be protruding from the bottom of the sleeve just enough so that the entire wrist pin area is exposed. Using tool 3091 or equivalent, install the wrist pin through the coolant passage. Install

the other wrist pin clip and slide the liner down into seated position.

16. Repeat this procedure for all cylinders. Install the cylinder head and remaining components in the reverse order of the removal procedure.

Piston and Connecting Rod

POSITIONING

Piston Identification and positioning marks: A = stamped arrow, must face towards the flywheel when the piston is installed; B = blue paint dot, indicates the matching size; C = weight group (+ or -); D = piston size in mm

ENGINE LUBRICATION

Oil Pump

REMOVAL & INSTALLATION

1. Relieve the fuel system pressure.
2. Disconnect the negative battery cable.

3. Remove the engine from the vehicle and position it in a suitable holding fixture.

4. Remove the 4 oil pump securing nuts and pry the pump assembly out of the crankcase.

5. To disassemble the pump, the pump cover must be pressed apart.

To install:

4. Prior to assembly, check the oil pump body for wear, especially the gear seating surface. If the pump body is worn, the result will be loss of oil pressure. Check the driven gear shaft for tightness and if necessary, peen it tightly into place or replace the pump housing. The gears should be checked for excessive wear, backlash and endplay. Maximum endplay without a gasket is 1mm (0.004 in.).

Oil pump assembly and lubrication system components

5. The endplay can be checked using a T-square and a feeler gauge. Check the mating surface of the pump body and the crankcase for damage and cleanliness.

6. Install the pump into the crankcase with a new gasket. Do not use any sealing compound.

7. Turn the camshaft several revolutions in order to center the pump body opposite the slot in the camshaft.

8. Tighten the securing nuts.

9. Install the engine and fill the crankcase to the correct level.

Crankshaft Oil Seal

REMOVAL & INSTALLATION

1. Relieve the fuel system pressure.
2. Disconnect the negative battery cable.

3. Remove the engine from the vehicle and support it in a suitable holding fixture.

4. Remove the flywheel. Once the flywheel is removed, inspect the surface on the flywheel joining flange where the seal makes contact.

5. If there is a deep groove or any other damage, the flywheel must be replaced.

6. Remove the oil seal by prying it out of its bore.

7. Before installing a new seal, clean the crankcase oil seal recess and coat it with sealing compound.

8. Be sure that the seal rests squarely on the bottom of its recess.

Make sure that the correct side of the lip of the seal is facing inward, towards the crankcase.

9. Reinstall the flywheel after coating the oil seal contact surface with oil.

NOTE: Be careful not to damage the seal when sliding the flywheel into place.

MANUAL TRANSAXLE

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transaxle Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Raise and safely support the vehicle.

3. Remove the top engine-to-transaxle bolts.

4. Remove the rear skid plate on 4WD vehicles.

5. Loosen the side bolts of the transaxle mounting bracket.

6. Remove the driveshaft-to-flange bolts and support the driveshaft aside.

7. Remove the left side halfshaft bolts and support the axle shaft aside.

8. Disconnect the clutch line bracket from the side of the transaxle.

9. Remove the clutch slave cylinder from its bracket and support it aside.

10. Disconnect the backup light switch wiring.

11. Remove the right side halfshaft bolts and support the halfshaft aside.

12. Disconnect the shift linkage from the transaxle. Place a suitable support under the transaxle/engine assembly.

13. Remove the front transaxle mounting bracket and lower the front of the transaxle approximately 6 in.

14. Disconnect the starter cables. Remove the vent hose from the transaxle.

15. Remove the bottom transaxle mounting bolts and pull the transmission off the engine guides.

16. Lower the transaxle from the vehicle.

Front differential housing forward

Front differential housing side mount bolts

Front transaxle bracket—mounting bolt

To install:

17. Raise the transaxle into position.
18. Install the lower transaxle mounting bolts, tighten to 22 ft. lbs. (30 Nm).
19. Reconnect the starter cables and install the vent hose. Raise the transaxle and install the front mounting bracket.
20. Connect the shift linkage to the transaxle and connect both halfshafts. Tighten the halfshaft bolts to 26 ft. lbs. (35 Nm).
21. Connect the backup light switch. Install the slave cylinder in its bracket.
22. Connect the clutch line bracket to the transaxle.
23. Connect the driveshaft to the drive flange and tighten the bolts to 26 ft. lbs. (35 Nm).
24. Install the transaxle bracket side mounting bolts.
25. Install the skid plate, if equipped.
26. Install the top transaxle mounting bolts. Tighten to 22 ft. lbs. (30 Nm).
27. Lower the vehicle and connect the battery cable.
28. Check the operation of the transaxle and check the clutch operation.

CLUTCH

Clutch Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Raise and safely support the vehicle.
3. Remove the transaxle from the vehicle.
4. Remove the pressure plate securing bolts a turn at a time until all spring pressure is released.
5. Remove the bolts and remove the clutch assembly.

NOTE: Note which side of the clutch disc faces the flywheel and install the new disc in the same direction.

6. Before installing the new clutch, check the condition of the flywheel. It should not have excessive heat cracks and the friction surface should not be scored or warped. Check the condition of the throw out bearing. If the bearing is worn, replace it.

To install:

7. Lubricate the pilot bearing in the end of the crankshaft with grease.
8. Insert a pilot shaft, used for centering the clutch disc, through the clutch disc and place the disc against

Hydraulic clutch system components

Clutch pedal stop adjusting screw

Adjusting the clutch pedal free-play

the flywheel. The pilot shaft will hold the disc in place.

NOTE: Make sure the correct side of the clutch disc is facing outward. The disc will rub the flywheel if it is incorrectly positioned.

9. After making sure that the pressure plate aligning dowels will fit into the pressure plate, gradually tighten the bolts.

10. Remove the pilot shaft and install the transaxle.

11. Lower the vehicle. Bleed the clutch system.

12. Connect the negative battery cable. Check the operation of the clutch.

CLUTCH PEDAL FREE-PLAY ADJUSTMENT

1. The clutch pedal should have a free-play of 0.20–0.28 in. and a 7 in. total travel. If either of the above are not to specifications, adjust the master cylinder as follows.

2. Loosen the master cylinder pushrod locknut and shorten the pushrod length slightly.

3. Loosen the master cylinder bolts and push the cylinder as far forward as it will go. Retighten the bolts.

4. Remove the rubber cap from the clutch pedal stop screw and adjust distance to 0.89 in. Install the rubber cap.

5. Lengthen the pushrod as necessary to obtain a pedal free-play of 0.20–0.28 in. Tighten the pushrod locknut.

6. Road test the vehicle to insure proper clutch operation.

Clutch Master Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Siphon the hydraulic fluid from the clutch master cylinder reservoir.
3. Pull back the carpeting from the pedal area and place some absorbent rags under the reservoir.
4. Pull the elbow connection from the top of the clutch master cylinder.
5. Disconnect and plug the pressure line from the rear of the master cylinder.
6. Remove the master cylinder mounting bolts and remove the cylinder from the rear.
7. Installation is the reverse of the removal procedure. Bleed the clutch system when finished.

Clutch Slave Cylinder

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.
2. Locate the slave cylinder on the bell housing.
3. Disconnect and plug the pressure line from the slave cylinder.
4. Disconnect the return spring from the pushrod.
5. Remove the retaining circlip from the boot and remove the boot.

6. Remove the circlip and slide the slave cylinder rearwards from its mount.

7. Remove the spring clip from the mount.

8. Installation is the reverse of the removal procedure. Bleed the system and check the operation of the clutch.

BLEEDING THE HYDRAULIC CLUTCH SYSTEM

NOTE: Use brake fluid that meets DOT 3 or DOT 4 specifications.

1. Fill the clutch fluid reservoir and make sure the cap vent is open.

2. Locate the slave cylinder bleed nipple and remove all dirt and grease from the valve. Attach a hose to the nipple and submerge the other end of the hose in a glass jar containing clean brake fluid.

3. Have an assistant operate the clutch pedal. Depresses the clutch pedal slowly to the floor, open the bleeder valve 1 turn. Hold the pedal on the floor until the bleeder valve is closed. Repeat this operation several times until no air bubbles are emitted from the tube.

NOTE: During the procedure, check the fluid level in the fluid reservoir. Never let the level fall below the 1/2 full mark.

4. After bleeding, discard the old fluid and top up the reservoir.

AUTOMATIC TRANSAXLE

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transaxle Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the torque converter-to-flywheel bolts through the hole in the top of the transaxle housing. Rotate the crankshaft to bring each bolt into position. Remove the top transaxle-to-engine bolts.

3. Raise and safely support the vehicle.

4. Disconnect both halfshafts from the transaxle, support them aside. On 4WD vehicles, remove engine skid

plate and disconnect the front driveshaft at the drive flange.

5. Disconnect the starter wiring and remove the starter.

6. Loosen the transaxle fluid dipstick tube.

7. Disconnect the accelerator linkage and accelerator cable.

8. Remove the circlip from the selector lever.

9. Support the engine with a suitable support bar.

10. Remove the ground strap and selector lever cable. Remove the side mounting bracket.

11. Support the transaxle with a suitable lifting device. Remove the rear transaxle support.

12. Remove the lower transaxle-to-engine bolts. Slowly lower the transaxle out of the vehicle. Use care not to drop the converter from the input shaft.

To install:

13. Raise the transaxle into position under the vehicle. Install the lower transaxle-to-engine bolts and tighten to 22 ft. lbs. (30 Nm).

14. Install the rear transaxle support.

15. Install the ground strap and selector lever cable. Install the side mounting bracket.

16. Remove the engine support bar and connector the selector lever.

17. Connect the accelerator cable and linkage. Attach the dipstick tube.

18. Install the starter. Install the front driveshaft and tighten the flange bolts to 33 ft. lbs. (45 Nm).

19. Connect the halfshafts and tighten the bolts to 33 ft. lbs. (45 Nm).

20. On 4WD vehicles, install the skid plate.

21. Install the upper transaxle bolts, tighten to 22 ft. lbs. (35 Nm).

22. Lower the vehicle and install the converter bolts. Tighten to 22 ft. lbs. (35 Nm).

23. Connect the negative battery cable and check the operation of the transaxle.

SHIFT LINKAGE ADJUSTMENT

1. Make sure the shift cable is not kinked or bent and that the linkage and cable are properly lubricated.

2. Move the gear shift lever to the P position.

3. Loosen the clamp which holds the front and rear halves of the shifting rod together. Loosen the clamping bolts on the transaxle lever.

4. Press the lever on the transaxle rearward, as far as possible. Spring pressure will be felt. The manual valve must be on the stop in the valve body.

5. Holding the transaxle lever against its stop, tighten the clamping bolt.

6. Holding the rear shifting rod half, push the front half forward to take up any clearance and tighten the clamp bolt.

7. Test the shift pattern.

NEUTRAL SAFETY SWITCH ADJUSTMENT

1. The combination neutral start and backup light switch is mounted inside the shifter housing.

2. The engine should start in P or N only and the backup lights should only come on only in R.

3. Adjust the switch by loosening the screws and moving it on its mounts.

4. After any adjustment or replacement, check that the engine starts only with the switch in P or N and the backup lights come on only in R.

DRIVE AXLE

Halfshaft

REMOVAL & INSTALLATION

Front

1. With the vehicle on the ground, remove the front halfshaft end-nut and washer.

Front suspension and drive assembly — Syncro 4WD

Front halfshaft assembly — exploded view

Rear wheel bearing and halfshaft assembly

2. Raise and support the vehicle safely. Remove the wheel and tire assembly.

3. Remove the socket head bolts retaining the halfshaft to the differential.

4. Remove the bolts holding the ball joint to the lower control arm.

5. Removing the ball joint from the control arm will give enough clearance to remove the axle shaft. It pulls right out of the steering knuckle.

6. Installation is the reverse of the removal procedure.

7. Always use a new halfshaft end-nut when installing. Tighten the halfshaft to differential bolts to 26 ft. lbs., the ball joint bolts to 22 ft. lbs. and the halfshaft end-nut to 236 ft. lbs.

Rear

1. Raise and support the vehicle safely.

2. Matchmark the halfshaft to the transaxle and to the stub axle.

3. Remove the bolts which secure the halfshaft at each end.

3. Tilt the halfshaft downwards and remove the halfshaft from the vehicle.

4. Install the halfshaft in position, aligning the matchmarks made during removal.

5. Torque the axleshaft bolts to 32 ft. lbs.

Driveshaft and U-Joints

REMOVAL & INSTALLATION

Syncro 4WD

1. Raise and safely support the vehicle.

2. Matchmark the driveshaft ends to the flanges.

3. Remove the driveshaft retaining bolts and remove the driveshaft from the vehicle.

4. Install the driveshaft in position, aligning the matchmarks.

5. Tighten the bolts to 33 ft. lbs. (45 Nm).

6. Lower the vehicle.

Front Wheel Bearing and Seal

REMOVAL & INSTALLATION

Syncro 4WD

1. Remove the outer halfshaft end nut and washer with the vehicle on the ground.

2. Raise and support the vehicle safely. Remove the wheel and tire assembly.

3. Remove the brake caliper from the steering knuckle and support it out of the way.

4. Remove the disc brake rotor from the hub assembly.

5. Remove the ball joint to control arm bolts and separate the ball joint from the control arm.

6. Remove the lower shock absorber mounting bolt.

7. Remove the tie rod end to steering knuckle nut and separate the tie rod from the steering knuckle.

8. While supporting the halfshaft, pull the steering knuckle and hub assembly out away from the vehicle. After separating the halfshaft from the steering knuckle assembly, support it out of the way.

9. Remove the steering knuckle to upper ball joint bolts and remove the steering knuckle assembly from the vehicle.

10. Use a suitable tool on top of parallel rail blocks on an arbor press to support the steering knuckle assembly. Place the steering knuckle and hub assembly on top of tools with the hub facing down.

11. Stack a suitable tool on top of the

hub shaft and press the hub from the steering knuckle.

12. Secure the hub in a vise. Using a puller, remove the inner race from the hub shaft.

13. Remove the internal snaprings from the steering knuckle.

14. With the steering knuckle assembly in the same pressing position, stack suitable pressing tools, on the bearing and press the bearing from the steering knuckle.

15. Thoroughly clean all parts. If worn or damaged parts are present, replace them.

To install:

16. Use the same set of tools used to extract the bearing, place the new bearing on the steering knuckle and press it into the steering knuckle until it seats against the bottom retaining ring. Install the other retaining ring.

17. Lift the steering knuckle assembly and place the hub on a flat surface followed by the steering knuckle, it must be facing the same direction.

18. Using suitable pressing tools, stack them on the bearing and press the hub into the steering knuckle assembly.

19. To complete the installation, reverse the removal procedures. Align the matchmarks and torque the steering knuckle bolts to 59 ft. lbs.

20. Torque the control arm to steering knuckle to 32 ft. lbs., the tie rod to the steering knuckle to 22 ft. lbs. and the halfshaft end nut to 236 ft. lbs.

Stub Axle, Bearing and Seal

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.

2. Remove the wheel and tire assembly, grease cap, cotter pin and axle nut.

3. Remove the brake drum and wheel hub.

4. Disconnect and plug the brake line at the wheel cylinder. Remove the brake assembly and backing plate.

5. Remove the 4 wheel bearing housing retaining bolts and remove the wheel bearing housing.

6. Slide the halfshaft out of the bearing housing.

7. Press the stub shaft from the bearing housing using the appropriate tools and a press.

8. Remove the inner and outer grease seals from the bearing housing.

9. Remove the spacer sleeve and the outer bearing.

10. Remove the inner grease seal and circlip. Press out the inner wheel bearing using the proper tools. Remove the spacer sleeve.

To install:

11. Pack new wheel bearings with grease.

12. Install a new spacer sleeve in the inner wheel bearing housing. Press the inner wheel bearing in until it is seated in the bearing housing. Fill the space between the inner and outer bearing with grease. Press the outer bearing into position using the same tools used to place the inner bearing. Install new spacer sleeves, circlip and grease seals.

13. Press the stub axle into the bearing housing.

14. Installation of the halfshaft is the reverse of the removal procedure.

15. Torque the wheel bearing housing to axle housing retaining bolts to 14 ft. lbs.

16. Install the remaining components in the reverse order of the removal procedure.

17. Tighten the brake line hose.

18. Bleed the brake system.

Front Differential

REMOVAL & INSTALLATION

Syncro 4WD

1. Raise and support the vehicle safely. Remove the skid plate.

2. Loosen, but do not remove, the front differential mounting bolt and the side differential mounting bracket bolts.

3. Matchmark and remove the driveshaft.

4. Disconnect the halfshafts, speedometer cable and vent hose from the differential.

5. Remove the differential rear mounting bolt. Remove the bracket from the frame.

6. Support the differential and remove the front mounting bolts.

7. Carefully lower the differential from the vehicle.

To install:

8. Raise the differential into position.

9. Install the rear mounting bolts, do not tighten. Install the bracket to the frame.

10. Connect the halfshafts, speedometer cable and vent hose.

11. Install the front mounting bolts.

12. Tighten the halfshaft-to-differential bolts to 26 ft. lbs., driveshaft-to-differential bolts to 26 ft. lbs.

13. Tighten the differential mounts and bolts last.

14. Align the driveshaft matchmarks during installation.

STEERING

Steering Wheel

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the horn pad from the steering wheel. Pull the horn pad up by hand to remove it.

3. Disconnect the electrical lead from the horn pad.

4. Matchmark the steering wheel and the steering shaft.

5. Remove the steering wheel hold-down nut and remove the steering wheel.

6. To install the steering wheel, align the matchmarks made during removal and install the wheel.

7. Tighten the retaining nut to 36 ft. lbs (50 Nm).

8. Install the horn pad. Connect the negative battery cable.

Manual Rack and Pinion

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Detach the connecting shaft from the coupling disc.

3. Remove the tie rod retaining nut from the end stud.

4. Using a suitable tie rod removal tool, remove the tie rod end from the bearing housing, being careful not to pull the ball out of its socket.

5. Unscrew the tie rod from the tie rod ends, while counting and recording the number of turns necessary to remove the tie rods.

6. At the steering rod/steering gear junction, pull back the boot and remove the clamping bolts, then separate the steering rod from the steering gear.

7. Remove the steering gear-to-subframe clamp nuts, the clamps and the steering gear assembly from the vehicle.

Steering assembly—typical

To install:

8. Install the steering gear in position in the vehicle. Torque the steering gear clamp nuts to 22 ft. lbs.

9. Install the steering rod to the steering gear. Install the boot over the steering rod. Tighten the steering rod bolt to 22 ft. lbs.

10. Install the tie rod into the tie rod end, counting the same number of turns as for removal.

11. Install the tie rods to the bearing housing.

12. Connect the steering rod to the coupling shaft.

Power Rack and Pinion

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Detach the connecting shaft from the coupling disc.

3. Remove the tie rod retaining nut from the end stud.

4. Using a suitable tie rod removal tool, remove the tie rod end from the bearing housing, being careful not to pull the ball out of its socket.

5. Disconnect and plug the power steering lines from the steering gear housing.

NOTE: Place a drain pan under the power steering pump suction hose to catch the fluid when removing the power steering lines, then discard the fluid.

6. Unscrew the tie rod from the tie rod ends, while counting and recording the number of turns necessary to remove the tie rods.

7. At the steering rod/steering gear junction, pull back the boot and remove the clamping bolts, then separate the steering rod from the steering gear.

8. Remove the steering gear-to-subframe clamp nuts, the clamps and the steering gear assembly from the vehicle.

To install:

9. Use new O-rings at the pressure hose connections and reverse the removal procedures.

NOTE: When reassembling the steering linkage, never put lubricant in the tapered steering gear fluid holes.

10. Torque the pressure hose-to-steering gear fittings to 15 ft. lbs., the steering gear clamp nuts and the steering rod-to-steering gear retaining bolt to 22 ft. lbs.

11. Fill the reservoir with an ap-

proved power steering fluid and bleed the system.

Power Steering Pump

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Place a pan under the power steering pump when draining the fluid.
2. Remove the suction hose and pressure line from the pump, then drain the fluid into the pan.
3. Loosen the belt tensioning bolt at the front of the bracket and remove the drive belt from the pulley.
4. Remove the pump mounting bolts and remove the pump from the vehicle.
5. Install the pump in position on the engine.
6. Tension the drive belt. Torque the mounting bolts to 15 ft. lbs.
7. Fill the reservoir with approved power steering fluid and bleed the system.

SYSTEM BLEEDING

1. Fill the power steering reservoir to **MAX** with Dexron® II automatic transmission fluid.
2. Raise and safely support the vehicle.
3. With the engine off, rotate the steering wheel from lock to lock.
4. Fill the reservoir to the **MAX** mark.
5. Start the engine several times, turning it off immediately after the engine starts. Add fluid as necessary, maintaining the level at the **MAX** mark.

NOTE: Never let the reservoir run out of fluid. Damage to the pump and/or steering gear may result.

6. When the fluid level no longer drops, start and run the engine. Rotate the steering wheel lock to lock several times. Check that no bubbles appear in the reservoir and that the level remains steady.

7. If air bubbles appear, repeat the procedure until the fluid is clear.

Tie Rod Ends

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the tie rods from the bearing housing. All tie rod ends are secured by a nut which holds the tapered tie rod end stud into a matching tapered hole.

2. Once the tie rod end stud has been removed, turn the tie rod end out of the adjustment sleeve, while counting the number of turns.

3. When reassembling, install the tie rods in the sleeve the same number of turn as when removing.

4. Check and adjust the toe in when finished.

BRAKES

For all brake system repair and service procedures not detailed below, please refer to "Brakes" in the Unit Repair section.

Master Cylinder

REMOVAL & INSTALLATION

NOTE: In order to remove the master cylinder reservoir, the instrument cluster must first be removed.

1. Disconnect the negative battery cable. Grasp the recesses provided on the back of the instrument cluster frame and pull it forward.
2. Disconnect and tag the wiring leading to the back of the instrument cluster and then remove the cluster.
3. Disconnect and plug the brake lines at the master cylinder.
4. Disconnect the electrical plug from the sending unit for the brake failure switch.
5. Remove the master cylinder mounting nuts.
6. Lift the master cylinder and reservoir out of the vehicle.

NOTE: Do not depress the brake pedal while the master cylinder is removed.

To install:

7. Position the master cylinder and reservoir assembly onto the mounting studs and install the washers and nuts. Tighten the nuts to 11-14 ft. lbs.
8. Remove the plugs and connect the brake lines to the master cylinder.
9. Connect the wiring to the sending unit for the brake failure switch.
10. Install the instrument cluster. Connect the negative battery cable.
11. Fill the master cylinder and bleed the brake system.
12. Install the instrument cluster cover.

Master cylinder and brake booster mounting

Power Brake Booster

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the instrument cluster. Remove the steering column covers and remove the steering column bolts (there are 2 shear bolts that retain the column, these must be drilled out and replaced).
3. Remove the glove box and remove the center dash panel. Pull off the heater controls levers.
4. Remove the screws inside the center cover and to the side of the instrument cluster opening.
5. Disconnect the air ducts under the instrument panel. Remove the instrument panel retaining screws at the top of the panel and at the sides. Remove the instrument panel from the firewall.
6. Disconnect the electrical leads from the stop light switch.
7. Remove the bolts that retain the pedal bracket to the firewall and remove the booster/pedal bracket assembly from the vehicle. Disconnect the pushrod from the pedal assembly.
8. Remove the booster retaining bolts and remove the booster from the bracket.

To install:

9. Install the booster to the bracket assembly. Tighten the nuts to 11 ft. lbs. (15 Nm).
10. Install the booster/pedal bracket assembly to the firewall. Connect the pedal to the pushrod and connect the stop light switch lead.
11. Install the instrument panel to the firewall. Use new shear bolts at the steering column.
12. Install the master cylinder.
13. Install the instrument cluster.
14. Bleed the brake system.
15. Connect the negative battery cable.

ble and install the instrument cluster hood.

Brake Caliper

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Remove the wheel and tire assembly.
2. Remove the brake pads from the caliper.
3. Disconnect and plug the brake fluid line at the caliper.
4. Remove the brake caliper mounting bolts and remove the caliper.

To install:

5. Position the caliper on the mount and install the mounting bolts.

NOTE: The upper caliper mounting bolt has a shoulder on the top of the bolt. This bolt must be installed on the top.

6. Torque the mounting bolts to 123 ft. lbs.
7. Connect the brake fluid line to the caliper. Install the brake pads, pins and clips.
8. Fill and bleed the entire brake system.

Disc Brake Pads

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Remove the wheel and tire assembly.
2. Using a suitable tool, knock out the brake pad retaining pins, inward.
3. Remove the brake pads.
4. Push the caliper piston into the caliper until it bottoms out.

To install:

5. Install the new brake pads and retaining pins. Check that the pins are fully seated in the caliper.
6. Install the wheel and tire assembly.
7. Repeat the procedure for the opposite side. Check the brake fluid level in the reservoir when finished.
8. Depress the brake pedal several

Front rotor and hub assembly—except Syncro 4WD

times until pressure is felt before moving the vehicle.

Brake Rotor

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Remove the wheel and tire assembly.
2. Remove the brake pads and pins.
3. Without disconnecting the brake fluid line, remove the brake caliper and mount. Support it aside.
4. Remove the cotter pin and bearing retaining nut. Remove the rotor.
5. Installation is the reverse of the removal procedure.
6. Adjust the wheel bearings.

Brake Drums

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. Remove the wheel and tire assembly.
3. Remove the drum retaining screws.
4. Remove the brake drum.
5. Install the brake drum in position and install the retaining screws. If the drum will not go on easily, turn the brake shoes in with the brake adjuster.
6. Install the wheel and tire assembly.
7. Lower the vehicle.

Brake Shoes

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. Remove the wheel and tire assembly.
3. Remove the brake drum.
4. Remove the brake shoe hold-down springs and pins.
5. Unhook the parking brake lever at the leading brake shoe.
6. Remove the lower return spring and the adjuster spring.
7. Move the brake shoes out of the lower support and unhook the return springs.
8. Remove the brake shoes and the push/adjusting rod.

To install:

9. Install the return springs and adjuster/push rod on the brake shoes.
10. Install the shoes on the backing plate and into the lower support.
11. Pull the top of the brake shoes around the wheel cylinder.
12. Install the hold-down spring and the pins.
13. Install the adjuster spring.

Parking brake lever and cable assemblies

14. Attach the parking brake lever. Install the lower return spring.
15. Turn the brake adjuster to pre-adjust the shoes.
16. Install the brake drum. Install the wheel and tire assembly.
17. Check the adjustment of the brakes.

Wheel Cylinder

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Remove the wheel and tire assembly. Remove the brake drum and brake shoes.
2. Disconnect and plug the brake line on the rear of the wheel cylinder.
3. Remove the bolts and lockwashers that attach the wheel cylinder to the backing plate and remove the wheel cylinder.
4. Position the new wheel cylinder on the backing plate and install the attaching bolts and lockwashers.
5. Connect the brake line.
6. Install the brake drum, brake shoes, wheel and tire assembly. Bleed the wheel cylinder.

Parking Brake Cable

REMOVAL & INSTALLATION

1. Disconnect the cables at the hand brake lever by removing the nuts which secure the cables to the lever. Pull the cables rearward to remove that end from the lever bracket.
2. Raise and support the vehicle safely. Remove the wheel and tire assemblies.
3. Remove the brake drum and de-

tach the cable end from the lever attached to the rear brake shoe.

4. Remove the brake cable bracket from the backing plate and remove the cable from the vehicle.

5. Installation is the reverse of the removal procedure.

6. Adjust the parking brake.

ADJUSTMENT

1. Brake cable adjustment is performed at the hand brake lever in the passenger compartment.

2. There is a cable for each rear wheel and there are 2 adjusting nuts at the lever.

3. Loosen the locknut at each cable.

4. Raise and safely support the rear wheel to be adjusted so that it can be turned by hand.

5. Turn the adjusting nut until a very slight drag is felt as the wheel is turned.

6. Back off on the adjusting nut until the lever can be pulled up 3 notches.

FRONT SUSPENSION

Shock Absorber

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely so that the front suspension is hanging freely. Remove the wheel and tire assembly.

2. Support the lower control arm and remove the upper and lower shock absorber mounting bolts, nuts and washers.

3. Remove the shock absorber from the vehicle.

4. Install the shock absorber, rubber boot and stopper.

5. Tighten the upper shock absorber mounting nut until the rubber washer is compressed to the same width as the metal washer.

6. Raise the lower control arm and tighten the lower shock absorber mounting bolt to 23-29 ft. lbs.

7. Install the wheel and tire assembly. Lower the vehicle.

Coil Spring

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Remove the wheel and tire assembly.

3. Remove the shock absorber.

4. With the shock absorber removed, the coil spring can be removed.

5. Remove the coil spring, noting the position of the rubber stopper.

To install:

6. Install the new coil spring and seat the spring in the lower control arm seat.

7. Install the shock absorber.

8. Install the wheel and tire assembly.

Upper Ball Joint

INSPECTION

1. Raise and support the vehicle safely so that the front wheels are hanging freely.

2. Insert a pry bar between the ball joint pinch bolt and upper control arm.

3. Measure the distance of ball joint play.

4. If the play exceeds 0.1 in., replace the ball joint.

Removing the lower ball joint mounting bolts

Removing the upper ball joint mounting bolts

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Remove the wheel and tire assembly.

2. Place an adjustable support under the lower control arm as close to the steering knuckle as possible. Raise

the control arm enough to put a slight load on the coil spring.

3. Loosen the steering knuckle-to-ball joint nut but do not remove the nut.

4. Free the ball joint from the steering knuckle, using the proper tools. Remove the ball joint nut.

5. Remove the upper ball joint to upper control arm bolts and remove the ball joint.

6. Installation is the reverse of the removal procedure. Check the front wheel alignment when finished.

Lower Ball Joint

INSPECTION

1. Raise and support the vehicle safely so that the front wheels are hanging freely.

2. Insert a pry bar between the ball joint pinch bolt and lower control arm.

3. Measure the distance of ball joint play.

4. If the play exceeds 0.1 in., replace the ball joint.

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Remove the wheel and tire assembly.

2. Place an adjustable support under the lower control arm as close to steering knuckle as possible and place a slight load on the coil spring.

3. Without disconnecting the brake caliper hose from the caliper, remove the brake caliper and rotor. Support them out of the way.

4. Loosen the upper ball joint-to-steering knuckle nut, but do not remove the nut. Free the upper ball joint from the steering knuckle, using the proper tools and remove the nut.

5. Remove the lower ball joint to lower control arm nut and remove the ball joint from the control arm. Remove the bearing housing.

6. Press the ball joint off of the bearing housing.

7. Press a new ball joint in place on knuckle, observing any alignment marks on the ball joint and the housing.

8. Installation is the reverse of the removal procedure.

Upper Control Arms

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Remove the wheel and tire assembly.

2. Raise the lower control arm to place a slight load on the coil spring.

3. Disconnect the upper ball joint from the bearing housing.

4. Remove the upper control arm to frame mounting bolt and remove the control arm.

To install:

5. Install the control arm to the frame and install the mounting bolt.

6. Connect the upper ball joint.

7. Check and adjust front wheel alignment when finished.

8. Install the wheel and tire assembly. Lower the vehicle.

Lower Control Arms

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Remove the wheel and tire assembly.

2. Remove the shock and coil spring.

3. Remove the lower control arm to frame mounting bolt and remove the control arm.

To install:

4. Install the lower control arm in position and install the mounting bolt.

5. Install the shock and coil spring.

6. Install the wheel and tire assembly.

7. Check and adjust the front wheel alignment.

Stabilizer Bar

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Remove the wheel and tire assemblies.

3. Remove the stabilizer bar-to-radius rod nuts on each side.

4. Remove the upper stabilizer bar supports and bushing.

5. Remove the stabilizer bar from the vehicle.

To install:

6. Install the stabilizer in position. Install the upper supports and bushings.

7. Install the stabilizer bar retaining nuts. Tighten to 22 ft. lbs.

8. Install the wheel and tire assembly and lower the vehicle.

Radius Rod

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Remove the wheel and tire assemblies.

3. Disconnect the stabilizer bar from the radius rod.

4. Remove the front retaining nut from the radius rod. Mark the position of the nut for installation.

5. Remove the rear radius rod mounting nuts from the lower control arm.

6. Remove the radius rod from the vehicle.

To install:

7. Install the radius rod in position. Install the rear retaining nuts.

8. Install the front rod nut, install it to the position marked during removal. Tighten the nut to 111 ft. lbs. (150 Nm).

9. Connect the stabilizer bar to the radius rod.

10. Install the wheel and tire assemblies.

11. Lower the vehicle.

REAR SUSPENSION

Shock Absorber

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Remove the wheel and tire assemblies.

3. Support the trailing arm assembly and remove the upper and lower shock mounting bolts.

4. Remove the shock absorber from the vehicle.

5. Installation is the reverse of the removal procedure.

6. Tighten the shock mounting bolts to 65 ft. lbs.

Coil Springs

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

Removing radius rod mounting bolts

2. Remove the wheel and tire assembly.

3. Support the trailing arm and remove the shock absorber.

4. Lower the trailing arm slightly and remove the coil spring.

5. Installation is the reverse of the removal procedure.

Trailing Arms

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Remove the wheel and tire assemblies.

3. Disconnect and plug the brake line. Remove the backing plate assembly from the trailing arm. The brake shoes do not need to be removed.

4. Disconnect the halfshaft from the transaxle.

5. Disconnect and remove the shock absorber and the coil spring.

6. Remove the trailing arm pivot bolt and lower the trailing arm from the vehicle with the halfshaft attached.

To install:

7. Install the trailing arm in position and install the pivot bolt. Tighten the pivot bolt to 65 ft. lbs.

8. Install the shock absorber and coil spring.

9. Connect the halfshaft to the transaxle.

10. Attach the backing plate assembly to the trailing arm, tighten the retaining bolts to 102 ft. lbs.

11. Connect the brake lines and bleed the brakes.

12. Install the wheel and tire assembly.

13. Road test the vehicle and check the handling.

Basic Maintenance

Introduction

Routine maintenance is probably the most important part of automobile care and the easiest to neglect. A regular program aimed at monitoring essential systems ensures that all components are in good and safe working order, and can prevent small problems from developing into major headaches. Routine maintenance also pays off big dividends in keeping major repair costs at a minimum and extending the life of the car.

The vehicle owner's manual includes a maintenance schedule indicating service intervals in numbers of months or thousands of miles. This schedule should always be followed. We have provided in this section a guide to service intervals based on an averaging of manufacturer's recommendations. In most cases the suggested interval offered here will be close to that given by the manufacturer of your car, but the manufacturer's schedule should always take precedence.

We have divided the maintenance work to be done into three categories: Under Hood, Under Car, and Exterior. The checks in each section require only a few minutes of attention every few weeks and the services to be performed can be easily accomplished in a morning. The most important part of any maintenance program is regularity. The few minutes or occasional morning spent on these seemingly trivial tasks will forestall or eliminate major problems later.

Under Hood Maintenance

AUTOMATIC TRANSMISSION, AUTOMATIC TRANSAXLE

The fluid level in the automatic transmission or transaxle should be checked every three months or 6000 miles. All automatic transmissions have a dipstick for fluid level checks.

Check the automatic transmission fluid level with the dipstick provided

1. Drive the car until it is at normal operating temperature. The level should not be checked immediately after the car has been driven for a long time at high speed, or in city traffic in hot weather; in those cases, the transmission should be given a half hour to cool down.

2. Stop the car, apply the parking brake, then shift slowly through all gear positions, ending in Park. Leave the engine running.

3. Remove the dipstick, wipe it clean, then reinsert it, pushing it fully home.

4. Pull the dipstick again and, holding it horizontally, read the fluid level.

5. Cautiously feel the end of the dipstick to determine the temperature. Most dipsticks are marked with both cool and hot levels. If the fluid is not up to the correct level, more will have to be added.

Fill the automatic transmission through the dipstick tube

NOTE: On General Motors Citation, Omega, Phoenix, Skylark, Cavalier, Cimarron, J2000, Celebrity, Cierra and 6000 models, the "Cold" level marks (dimples) are above the "Hot" level area.

6. Fluid is added through the dipstick tube. You will probably need the aid of a spout or a long-necked funnel. Be sure that whatever you pour through is perfectly clean and dry. Fluid recommendations can be found in the owner's manual or the Auto-

matic Transmission Unit Repair Section in this book. Add fluid slowly and in small amounts, checking the level frequently between additions. Do not overfill, which will cause foaming, fluid loss, slippage, and possible transmission damage.

BATTERY

Fluid Level (Except "Maintenance Free" Batteries)

Check the battery electrolyte level at least once a month, or more often in hot weather or during periods of extended car operation. The level can be checked through the case on translucent polypropylene batteries; the cell caps must be removed on other models. The electrolyte level in each cell should be kept filled to the split ring inside, or the line marked on the outside of the case.

If the level is low add only distilled water or colorless, odorless drinking water through the opening until the level is correct. Each cell is completely separate from the others, so each must be checked and filled individually.

If water is added in freezing weather, the car should be driven several miles to allow the water to mix with the electrolyte. Otherwise, the battery could freeze.

Specific Gravity (Except "Maintenance Free" Batteries)

At least once a year, check the specific gravity of the battery. It should be between 1.20 and 1.26 at room temperature. See the "Charging and Starting Systems" Section in this book for details.

Cables and Clamps

Once a year, the battery terminals and the cable clamps should be cleaned. Loosen the clamps and remove the cables, negative cable first. On batteries with posts on top, the use of a puller specially made for the purpose is recommended. These are inexpensive, and available in auto parts stores. Side terminal battery cables are secured with a bolt.

Clean the cable clamps and the battery terminal with a wire brush, until all corrosion, grease, etc. is removed and the metal is shiny. It is especially important to clean the inside of the clamp thoroughly, since a small deposit of foreign material or oxidation there will prevent a sound electrical connection and inhibit either starting or charging. Special tools are available for cleaning these parts, one type for conventional batteries and another type for side terminal batteries.

Fill the battery cell to the bottom of the split ring

Use a puller to remove the clamp on post-type batteries

Clean the clamp with a wire brush

Before installing the cables, loosen the battery hold-down clamp or strap, remove the battery and check the battery tray. Clear it of any debris, and check it for soundness. Rust should be wire brushed away, and the metal given a coat of anti-rust paint. Replace the battery and tighten the hold-down clamp or strap securely, but be careful not to overtighten, which will crack the battery case.

After the clamps and terminals are clean, reinstall the cables, negative cable last; do not hammer on the clamps to install. Tighten the clamps securely, but do not distort them. Give

The posts are easily cleaned with a wire brush, or the battery post tool shown

A special tool is required to clean the terminals and clamps on side terminal batteries

the clamps and terminals a thin external coat of grease after installation, to retard corrosion.

Check the cables at the same time that the terminals are cleaned. If the cable insulation is cracked or broken, or if the ends are frayed, the cable should be replaced with a new cable of the same length and gauge.

CAUTION

Keep flame or sparks away from the battery; it gives off explosive hydrogen gas. Battery electrolyte contains sulphuric acid. If you should splash any on your skin or in your eyes, flush the affected area with plenty of clear water; if it lands in your eyes, get medical help immediately.

15 BASIC MAINTENANCE

BRAKE FLUID

Once a month, the fluid level in the brake master cylinder should be checked.

1. Park the car on a level surface.
2. Clean off the master cylinder cover before removal. Most covers are held on by a wire bail, which can be pushed aside with thumb pressure, or levered off with a screwdriver. Some covers are retained by a bolt. Some of the newer master cylinders with plastic reservoirs have screw caps. Remove the cover, being careful not to drop or tear the rubber diaphragm which will probably be underneath. Be careful also not to drip any brake fluid on painted surfaces; the stuff eats paint.

NOTE: Brake fluid absorbs moisture from the air, which reduces effectiveness and will corrode brake parts once in the system. Never leave the master cylinder or the brake fluid container uncovered for any longer than necessary.

3. The fluid level should be about $\frac{1}{4}$ inch below the lip of the master cylinder well.

4. If fluid addition is necessary, use only extra heavy duty disc brake fluid meeting DOT 3 specifications. The fluid should be reasonably fresh, because brake fluid deteriorates with age.

5. Replace the cover, making sure that the diaphragm is correctly seated.

If the brake fluid level is constantly low, the system should be checked for leaks. However, it is normal for the fluid level to fall gradually as the disc brake pads wear; expect the fluid level to drop about $\frac{1}{8}$ inch for every 10,000 miles of wear.

BELT TENSION ADJUSTMENT

Every six months or 12,000 miles, check the water pump, alternator, power steering pump, air pump, and air conditioning compressor drive belts for proper tension. Also look for signs of wear, fraying, separation, glazing and so on, and replace the belts as required.

Belt tension should be checked with a gauge made for the purpose. If a gauge is not available, tension can be checked with moderate thumb pressure applied to the belt at its longest span midway between pulleys. If the belt has a free span less than twelve inches, it should deflect approximately $\frac{1}{8}$ – $\frac{1}{4}$ inch. If the span is longer

Lever the ball off the master cylinder cap with a screwdriver

Screw caps are used on some master cylinders

Proper brake fluid level

than twelve inches, deflection can range between $\frac{1}{8}$ – $\frac{3}{8}$ inches.

NOTE: On cars except American Motors models which use a one-piece "serpentine" belt to drive all accessories, belt tension is automatically adjusted. On cars which have two "serpentine" belts, or one "serpentine" belt as well as conventional V-belts, and on all American Motors models with the "serpentine" belt, belt

Check the belts for wear

Check the belt tension at the middle of the longest span between pulleys

tensions usually must be checked and adjusted. Belt tension is higher on "serpentine" belts and cannot be tested with thumb pressure. Some Ford models (Thunderbird/XR-7 with AOD transmission) require special tools for adjustment. American Motors "serpentine" belts are adjusted at the alternator.

To adjust or replace belts:

1. Loosen the driven accessory's pivot and mounting bolts. Some air conditioning compressor belts are tensioned by an idler pulley; in this case, loosen the idler pulley and use a $\frac{1}{2}$ in. drive ratchet in the square hole provided to lever the idler pulley up or down.

2. Move the accessory toward or away from the engine until the tension is correct. You can use a wooden hammer handle or broomstick as a lever, but do not use anything metallic.

3. Tighten the bolts and recheck the tension. If new belts have been installed, run the engine for a few minutes, then recheck and readjust as necessary.

NOTE: If the driven component has two drive belts, the belts should be replaced in pairs to maintain proper tension.

It is better to have belts too loose

To either adjust or remove a belt, loosen the driven component's adjusting bolt

Push the component toward the engine to remove the belt

than too tight, because overtight belts will lead to bearing failure, particularly in the water pump and alternator. However, loose belts place an extremely high impact load on the driven component due to the whipping action of the belt.

CARBURETOR AND CHOKE LINKAGE

Every 12 months or 6000 miles, examine the carburetor linkage and choke plate for free movement. The choke plate action can generally be freed, if necessary, with the application of a solvent made for the purpose to the ends of the choke shaft. This solvent

Slip the replacement belt over the pulley

Pull outwards on the component to tension the belt, then tighten the bolts; recheck the belt tension after tightening

Use a spray solvent on the choke shaft, but do not apply any lubricants

will also clean grease and dirt from the throttle linkage.

COOLING SYSTEM

Once a month, the engine coolant level should be checked. On cars without a coolant recovery system, this should only be done when the engine is cold. Remove the radiator cap, the coolant level should be about one inch below the radiator filler neck.

Proper coolant level is about one inch below the radiator neck, or between the lines on the recovery tank

Check the radiator cap gasket and sealing surface

CAUTION

To avoid injury when working with a hot engine, cover the radiator cap with a thick cloth. Wear a heavy glove to protect your hand. Turn the radiator cap slowly to the first stop, and allow all the pressure to vent (indicated when the hissing noise stops). When the pressure has been released, remove the cap the rest of the way.

On cars with a coolant recovery tank, coolant should be visible within the tank; as long as the coolant is between the markings on the tank, the level is correct.

If coolant is needed, a 50/50 mix of ethylene glycol-based antifreeze and water should always be used, both winter and summer. This is imperative on cars with air conditioning; without the antifreeze, the heater core could freeze when the air conditioning is used. Add coolant to the radiator if the car does not have a coolant recovery system. Add coolant to the recovery tank on cars so equipped.

The radiator hoses and clamps and the radiator cap should be checked at the same time as the coolant level. Hoses which are brittle, cracked, or swollen should be replaced. Clamps should be checked for tightness (screwdriver tight only; do not allow the clamp to cut into the hose or crush

15 BASIC MAINTENANCE

the fitting). The radiator cap gasket should be checked for any obvious tears, cracks or swelling, or any signs of incorrect seating in the radiator neck.

The cooling system should be drained, flushed and refilled after the first 24 months or 24,000 miles, and every year thereafter.

1. Drain the radiator by opening the drain cock at the bottom. Some radiators do not have these; the lower radiator hose must be disconnected at the radiator instead. If the engine block has drain plugs, they should be opened to speed draining.

2. Close the drain cocks and fill the system with clear water. A cooling system flushing additive can be used, if desired.

3. Run the engine until it is hot. The heater should be turned on to its maximum heat position so that the core is flushed out.

4. Drain the system, then flush with water until it runs clear.

5. Clean out the coolant recovery tank, if equipped.

6. Fill the system with a 50/50 mix of ethylene glycol-based antifreeze and water. Fill the coolant recovery tank midway between the marks with this mixture also (except G.M. cars, which should be filled to the "Full Cold" mark).

7. Run the engine until it is hot, then let it cool and top up the radiator or coolant recovery tank as necessary with the anti-freeze/water mixture.

HEAT RISER

The heat riser is a thermostatically or vacuum operated valve in the exhaust manifold. (Not all cars have one.) It closes when the engine is warming up, to direct hot exhaust gases to the intake manifold, in order to preheat the incoming fuel/air mixture. If it sticks open, the result will be frequent stalling during warmup, especially in cold and damp weather. If it sticks shut, the result will be a rough idle after the engine is warm.

NOTE: Some 1981 and later GM engines are equipped with an electrically heated ceramic grid mounted below the carburetor which takes the place of a heat riser.

The heat riser should move freely. It can be checked easily when the engine is cold by giving the counterweight on the valve shaft a twirl, or pulling the vacuum rod to open and shut the valve. If the valve is sticking or binding, a quick shot of solvent made for the purpose will free it up. This solvent should be applied every

Exploded view of a vacuum-operated heat riser

Thermostatically-operated heat control valve

Inspect the ignition cables for cracks or breaks in the insulation

six months or 6000 miles to keep the valve free. If the valve is still stuck after application of the solvent, sometimes rapping the end of the shaft lightly with a hammer will break it loose. Otherwise, the components will have to be removed for further repairs.

IGNITION WIRES

The ignition system receives regular attention in the form of a tune-up, and thus is not covered here. But one of the most commonly overlooked components is the ignition cable, or spark plug wire.

Although they rarely show any visible signs of deterioration, the ignition cables should be checked at every tune-up, and replaced every 50,000 miles. Cracking and embrittlement

Test the ignition cables with an ohmmeter. Conventional ignition cables should be removed from the distributor cap, but electronic ignition wires should first be tested through the cap

Check the engine oil level with the dipstick

are of course obvious signs of wear, but most newer cables have silicone insulation and thus are not prone to display these conditions.

The most reliable way to check the cables is with an ohmmeter. On conventional ignitions, the resistance should be less than 7,000 ohms per foot (wire removed). On cars with electronic ignitions, it is generally recommended to leave the wire attached to the distributor cap, test with one lead from the ohmmeter connected to the corresponding terminal in the distributor cap, the other lead touched to the disconnected end of the cable at the spark plug. Then, if resistance seems close to the limit, remove the wire from the cap and retest. In general, the spark plug wires on electronic ignitions should be replaced if the total resistance is over 36,000 ohms. (50,000 ohms on Ford and Chrysler products).

Always replace the cables with new ones of the same type. Replace the wires one at a time, working from the longest to the shortest.

OIL LEVEL

The engine oil should be checked on a regular basis, ideally at each fuel stop, or once a week. It is best to check when the engine is at operating temperature, but checking the level im-

mediately after shutting off the engine will give a false reading, because all of the oil will not yet have drained back into the crankcase. The car should be parked on a level surface to obtain an accurate reading.

1. Remove the oil dipstick. Wipe it clean, then replace it, seating it firmly.

2. Remove the dipstick again and hold it horizontally to prevent the oil from running. The level should be between the "Add" and "Full" marks on the dipstick. The dipstick may be marked "Add" and "Safe", or may have lines scribed on it; in any case, the oil level should be above the lower marking.

3. If the oil is below the lower mark, enough oil should be added to the engine to raise the level to the upper mark. The markings are usually spaced so that one-half to one quart of oil will raise the level from the "Add" mark to the "Full" mark. Oil is added through the capped opening in the valve cover. Only oils labeled SE or SF should be used; select a viscosity that will be compatible with the temperatures expected until the next drain interval.

NOTE: The diesel engines used in GM cars require the use of SF/CC or SF/CD type oils only. Do not use oil which is rated for SE or SF use only, or which is rated for CD use. Do not use the oil if the rating CD appears anywhere on the can, either alone or in combination with ratings other than SF, such as SE/CD. The use of CD type oil will void the manufacturer's warranty, and may cause expensive engine damage and leakage.

4. Replace the dipstick, then check the level again after any additions of oil. Be careful not to overfill, which will lead to leakage and seal damage.

POWER STEERING

The power steering fluid level is checked with a dipstick inserted into the pump reservoir. The dipstick may be attached to the reservoir cap, or inserted into a tube on the pump body. The level should be checked at every oil change. On all cars except Ford products, the level can be checked with the fluid either warm or cold; on Fords, the engine must be at operating temperature.

1. On Ford products, with the engine hot and idling, turn the steering wheel back and forth to the full right and full left stops several times, then center the wheels and shut off the engine.

Add oil through the valve cover

CHECK FLUID
LEVEL ON DIPSTICK

The power steering level is checked with the dipstick installed in the reservoir

2. On all cars, with the engine off, pull or unscrew the dipstick and check the level. If the engine is warm, the level should be between the "Hot" and "Cold" marks on the dipstick; on Fords, the level should be between the "Cold Full" and "Hot Full" marks. If the engine is cold, the fluid should be between the "Add" and "Cold" marks; this does not apply to Ford products.

3. If the level is low, add power steering fluid until correct. Be careful not to overfill, which will cause fluid loss and seal damage.

WINDSHIELD WASHER FLUID

Check the fluid level in the windshield washer tank at every oil level check. The fluid can be mixed in a 50% solution with water, if desired, as long as temperatures remain above freezing. Below freezing, the fluid should be used full strength. Never add engine coolant antifreeze to the washer fluid, because it will damage the car's paint.

Power steering dipstick markings, typical of all types except Ford

Under Car

AXLE

The fluid level in the drive axle should be checked every 12 months or 12,000 miles. On the front wheel drive Omni, Horizon, Aries, Reliant LeBaron and Dodge 400 with automatic transmission, the drive axle lubricant is separate from the automatic fluid and must be checked separately. The level can be checked through the fill plug in the drive axle housing.

On the American Motors Eagle, SX/4 and Kammbach, both drive axles should be checked. Both assemblies have fill plugs for this purpose.

1. With the car parked on a level surface, remove the filler plug. The plug can be found either in the rear cover of the differential, or on the front of the pinion housing.

2. If lubricant dribbles out when the plug is removed, the level is correct. Otherwise, stick in your finger (watch out for sharp threads); the fluid should be even with or just a little below the filler hole.

3. If lubricant is needed, use SAE 80W-90 GL-5 gear oil (SAE 80W GL-5 in very cold climates) to fill standard axles. Limited slip axles require a special lubricant, available in auto parts stores. The Omni, Horizon, Aries, Reliant Dodge 400 and LeBaron drive axles should be filled with DEXRON II ATF fluid.

4. When the level is correct, install the plug and tighten until snug. Do not overtighten.

Drive axles should be drained and refilled according to the manufacturer's maintenance schedule, usually found in the owner's manual. If the unit is used in severe driving conditions (trailer towing, etc.) the lubricant should be changed more often. Some later model drive axles do not require regular draining and refilling. Refer to the owner's manual for information on this subject. The axle may be drained by removing the drain

15 BASIC MAINTENANCE

Rear axle filler plug locations

Apply a bead of silicone sealer to the rear cover if no gasket is used

plug at the bottom of the axle housing, if present. Otherwise the rear cover (if equipped) must be removed or a suction gun used through the filler hole. Always use silicone sealer or a gasket when re-installing the rear cover. Run sealer around the insides of the bolt holes. Tighten the bolts a few turns at a time in a crisscross pattern.

EXHAUST SYSTEM

The exhaust system should be checked twice a year for general soundness. Inspect the pipes for holes, broken welds, leaking seams, or loose connections. Leaks at connections can sometimes be successfully repaired with the use of a commercial exhaust pipe sealer, but holes or breaks warrant replacement of the part. The exhaust pipe hangers and straps should be examined for any breaks or cracks;

Lubricate the parking brake cable with white waterproof grease

MANUAL TRANSMISSION
FILL TO BOTTOM OF FILLER HOLE WITH VEHICLE ON LEVEL GROUND.

Typical manual transmission filler plug location

replace these as necessary. Some slight cracking of rubber hangers is normal, but deep cracks or cuts are cause for replacement.

CAUTION

Check the exhaust system only when it is cold. The temperature on an exhaust system using a catalytic converter can reach 1000°F after only a short period of engine operation.

MANUAL TRANSMISSION OR MANUAL TRANSAXLE

The fluid level in the manual transmission (or transaxle on front wheel drive cars) should be checked twice a year, or every 6000 miles.

1. Park the car on a level surface. The transmission should be cool to the touch.

2. Remove the filler plug from the side of the transmission or transaxle. If lubricant trickles out as the plug is removed, the fluid level is correct. If not, stick in your finger (watch out for

sharp threads); the lubricant should be right up to the edge of the filler hole.

3. If lubricant is needed, use SAE 80W-90 GL-5 gear lubricant (SAE 80W GL-5 in extremely cold climates) in manual transmission.

Front wheel drive transaxles use different lubricants. The Omni and Horizon with the A412 transaxle (starter on the radiator side of the engine) require GL-4 hypoid gear lubricant; the same SAE viscosities apply (80W-90 or 80W; 75W in temperatures below -30°F). GL-5 classification lubricants are specifically not recommended. Omnis and Horizons with the A460 transaxle (starter on the firewall side of the engine), and all Aries, Reliant LeBaron and Dodge 400 models use DEXRON II automatic transmission fluid.

The front wheel drive Citation, Omega, Phoenix, Skylark Cavalier, J2000, Cimarron, Celebrity, Sierra and 6000 require DEXRON II automatic transmission fluid. The use of a manual transmission lubricant is specifically not recommended.

The Ford Escort, EXP, and Mercury Lynx and LN-7 use Ford Type F automatic transmission fluid. The use of a manual transmission lubricant is specifically not recommended.

4. When the level is correct, install the filler plug and tighten until snug.

PARKING BRAKE LINKAGE

The parking brake cable assembly should be inspected twice a year for fraying, kinks, and binding. A smooth white waterproof lubricant should be applied at the same time to all pivot points and areas in sliding contact.

SUSPENSION LUBRICATION

Depending on the year of manufac-

ture, there may be as many as twelve grease fittings on the suspension parts, or as few as two. Typical locations for grease nipples are on the ball joints, control arm pivot points, steering linkage, and the tie-rod ends.

Lubricate these fittings with a small hand operated grease gun filled with EP chassis lubricant. Pump grease into the fitting slowly, until it begins to ooze out around the joint, or until the grease begins to expand the rubber boot around the fitting. Be extremely careful not to rupture any seals or boots, as this will lead to lubricant loss and contamination of the parts involved.

Occasionally, the grease nipples may become clogged with dirt or hardened grease. If so, unscrew them with a wrench of the proper size and clean them out with solvent. When reinstalled, they may be covered with plastic caps made for the purpose, or a piece of aluminum foil.

The chassis and suspension parts should be lubricated once a year, or every 7500 miles, whichever comes first.

TRANSFER CASE

If you have a four-wheel drive AMC car, you should check the transfer case lubricant level every 5000 miles.

1. Park the car on a level surface.
2. Check the build date tag on the rear of the transfer case.

3. If the transfer case was built after March 1980, the fill plug will be at location "A" in the illustration. Remove the fill plug. The lubricant should be right up to the edge of the filler hole. Check and correct as necessary.

4. If the transfer case was built before March, 1980, the filler plug may be in any one of the four locations shown in the illustration. Check to see which one you have, then remove the filler plug. Use a length of wire to measure the distance from the bottom edge of the fill hole to the lubricant. The correct distance depends on the location of the hole:

- "A" 0.56 inch
- "B" 1.13 inch
- "C" 1.20 inch
- "D" 0.56 inch

5. The correct fluid to use is 10W-30 SE or SF motor oil. Capacity is 4.0 pints, regardless of when the transfer case was built. Some early owner's manuals may have listed the capacity as 3.0 pints, but this is incorrect; revised publications call for a capacity of 4.0 pints.

The transfer case should be drained and refilled every 15,000 miles. The drain plug is located at the lower edge

of the rear face of the case. Installation torque for the plugs is 18 ft. lbs. The case is made from aluminum, so this figure should not be exceeded.

Exterior

DRAIN HOLES AND UNDERBODY

Most cars have drain holes spaced along the lower edge of the rocker panels and doors. These holes should be cleared of any debris or rust twice a year. A small screwdriver can be used to open plugged drain holes.

Every spring, the underbody should be flushed with clear water to remove deposits of mud, road salt, and debris. It is advisable to loosen any packed-in sediment before flushing to assure a more thorough cleaning.

HINGES AND LOCKS

Once a year, the door, hood, and trunk hinges, and all locks should be lubricated to ensure smooth operation. The hinge points should be lightly oiled. Lock cylinders may be easily lubricated with a shot of silicone spray directed into the keyhole. Silicone lubricant also works well on the door latch mechanisms, and keeps the door, trunk, and window weather seals pliable when applied in a light film.

TIRES

Tires should be checked weekly for proper air pressure. A chart, located either in the glove compartment or on the driver's or passenger's door, gives the recommended inflation pressures. Maximum fuel economy and tire life will result if the pressure is maintained at the highest figure given on the chart.

Pressures should be checked before driving since pressure can increase as much as six pounds per square inch (psi) due to heat buildup. It is a good idea to have your own accurate pressure gauge, because not all gauges on service station air pumps can be trusted. When checking pressures, do not neglect the spare tire. Note that some spare tires require pressures considerably higher than those used in the other tires.

While you are about the task of checking air pressure, inspect the tire treads for cuts, bruises and other damage. Check the air valves to be sure that they are tight. Replace any missing valve caps.

Check the tires for uneven wear that might indicate the need for front end alignment or tire rotation. Tires

Tire tread depth can be checked with a penny. If the top of Lincoln's head is visible, the tires are due for replacement

Tread wear indicators will appear as a band across the tire when the tread has worn out.

should be replaced when a tread wear indicator appears as a solid band across the tread.

When buying new tires, give some thought to the following points, especially if you are considering a switch to larger tires or a different profile series:

1. All four tires must be of the same construction type. This rule cannot be violated. Radial, bias, and bias-belted tires must not be mixed.

2. The wheels should be the correct width for the tire. Tire dealers have charts of tire and rim compatibility. A mismatch will cause sloppy handling and rapid tire wear. The tread width should match the rim width (inside bead to inside bead) within an inch. For radial tires, the rim width should be 80% or less of the tire (not tread) width.

3. The height (mounted diameter) of the new tires can change speedometer accuracy, engine speed at a given road speed, fuel mileage, acceleration, and ground clearance. Tire manufacturers furnish full measurement specifications.

4. The spare tire should be usable,

Tire rotation diagrams

at least for short distance and low speed operation, with the new tires.

5. There shouldn't be any body interference when loaded, on bumps, or in turns.

Tire Rotation

Tire rotation is recommended every 6000 miles or so, to obtain maximum tire wear. The pattern you use depends on whether or not your car has a usable spare. Radial tires should not be cross-switched (from one side of the car to the other); they last longer if their direction of rotation is not changed. Snow tires sometimes have directional arrows molded into the side of the carcass; the arrow shows the direction of rotation. They will wear very rapidly if the rotation is reversed. Studded tires will lose their studs if their rotational direction is reversed.

NOTE: Mark the wheel position or direction of rotation on radial tires or studded snow tires before removing them.

Storage

Store the tires at the proper inflation pressure if they are mounted on wheels. Keep them in a cool dry place, laid on their sides. If the tires are stored in the garage or basement, do not let them stand on a concrete floor; set them on strips of wood.

WINDSHIELD WIPERS AND WASHERS

For maximum effectiveness and longest element life, the windshield and wiper blades should be kept clean. Dirt, tree sap, road tar and so on will cause streaking, smearing and blade deterioration if left on the glass. It is advisable to wash the windshield carefully with a commercial glass cleaner at least once a month. Wipe off the rubber blades with the wet rag afterwards.

For access to the blades on wiper systems which park below the hood line, turn the ignition key to "On" and run the wipers to the center of the windshield. Shut the wipers off with the ignition key, not the wiper switch. Do not attempt to move the wipers by hand; damage to the motor and drive mechanism will result.

If the blades are found to be cracked, broken or torn, they should be replaced immediately. Replacement intervals will vary with usage, although ozone deterioration usually limits blade life to about one year. If the wiper pattern is smeared or streaked, or if the blade chatters across the glass, the elements should be replaced. It is easiest and most sensible to replace the elements in pairs.

There are basically three different types of refills, which differ in their

method of replacement. One type has two release buttons, approximately one-third of the way up from the ends of the blade frame. Pushing the buttons down releases a lock and allows the rubber filler to be removed from the frame. The new filler slides back into the frame and locks in place.

The second type of refill has two metal tabs which are unlocked by squeezing them together. The rubber filler can then be withdrawn from the frame jaws. A new refill is installed by inserting the refill into the front frame jaws and sliding it rearward to engage the remaining frame jaws. There are usually four jaws; be certain when installing that the refill is engaged in all of them. At the end of its travel, the tabs will lock into place on the front jaws of the wiper blade frame.

The third type is a refill made from polycarbonate. The refill has a simple locking device at one end which flexes downward out of the groove into which the jaws of the holder fit, allowing easy release. By sliding the new refill through all the jaws and pushing through the slight resistance when it reaches the end of its travel, the refill will lock into position.

Regardless of the type of refill used, make sure that all of the frame jaws are engaged as the refill is pushed into place and locked. The metal blade holder and frame will scratch the glass if allowed to touch it.

Windshield wiper blade replacement methods

15 BASIC MAINTENANCE

Washer Nozzle Adjustment

CENTERED SINGLE POST – NON-ADJUSTABLE NOZZLES

This type is usually located on the rear center of the hood panel, directly in front of the windshield. By loosening the body retaining nut from under the hood, the nozzle body can be turned to provide the best spray discharge to cover the windshield. Tighten the retaining nut while holding the nozzle body in position.

Washer nozzles should be adjusted to hit the windshield above center

Some jets can be adjusted with a piece of fine wire or a thin needle

CENTERED SINGLE POST – ADJUSTABLE NOZZLES

This nozzle is adjusted with a wrench, screwdriver, or pliers. If the nozzle has no gripping area, the adjustment is made by inserting a stiff wire into the nozzle opening and moving the nozzle in the direction desired. When using the wire as an adjuster tool, do not force the nozzle; the wire can be broken within the nozzle opening.

INDIVIDUAL NOZZLES

A tab is usually fastened to the nozzle stem to assist in turning the nozzle in the desired direction. If a tab is not present, use a pair of pliers to gently move the nozzle.

WIPER ARM NOZZLES

No adjustment is necessary on this type of nozzle, because the opening is centered on the wiper arm and moves along with the arm.

This type of jet is adjusted with pliers or by hand

Clean the nozzles with a piece of fine wire

LIFT BLADE END OF ARM AWAY FROM WINDSHIELD

RELEASE LATCH

Side latch wiper arm replacement

Some wiper systems use an auxiliary (articulated) wiper arm. It is secured to an auxiliary pivot by a sliding lock.

Pin and hole type wiper arm replacement

Tools And Equipment

In addition to the normal assortment of screwdrivers and pliers, automotive service work requires an investment in wrenches, sockets and the handles needed to drive them, and various measuring tools such as torque wrenches and feeler gauges.

The best approach to gathering the required equipment is to proceed slowly, buying high-quality tools as they are needed. An initial investment should be made in a set of quality wrenches, ranging in size from $\frac{1}{4}$ inch to one inch, if your car has standard bolts, or from 5mm to 19mm if your car has metric fasteners. High quality forged wrenches are available in three styles; open end, box end, and combination open/box end. The combination tools are generally the most desirable as a starter set; the wrenches shown in the illustration are of the combination type.

NOTE: Many later model American cars use both metric and standard nuts and bolts.

The other set of tools inevitably required is a ratchet handle and socket set. This set should have the same size range as your wrench set. The ratchet, extension, and flex drives for the sockets are available in many sizes; it is advisable to choose a $\frac{3}{8}$ inch drive set initially. One break in the inch/metric sizing war is that metric-sized sockets sold in the U.S. have inch-sized drive ($\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$, etc.). Sockets are available in six and twelve point versions; six point types are generally cheaper and are a good choice for a first set.

The choice of a drive handle for the sockets should be made with some care. If this is your first set, take the plunge and invest in a flexhead ratchet; it will get into many places otherwise accessible only through a long

chain of universal joints, extensions and adapters. An alternative is a flex handle; such a tool is shown in the illustration, below the ratchet handle. In addition to the range of sockets mentioned, a rubber-lined spark plug socket should be purchased. Spark plugs have either a $\frac{13}{16}$ or a $\frac{5}{8}$ inch hex; get the correct socket for the plugs in your car.

The most important thing to consider when purchasing hand tools is quality. Don't be misled by the low cost of "bargain" tools. Forged wrenches, tempered screwdriver blades, and fine tooth ratchets are a much better investment than their less expensive counterparts. The skinned knuckles and frustration inflicted by poor quality tools make any job an unhappy core. Another consideration is that quality tools sold by reputable firms come with an on-the-spot replacement guarantee; if the tool breaks, you get a new one, no questions asked.

The tools needed for basic maintenance jobs, in addition to those just mentioned, include:

1. Jackstands, for support;
2. Oil filter wrench;
3. Oil filler spout or funnel;
4. Grease gun;
5. Battery hydrometer;
6. Battery post and clamp cleaner;
7. Container for draining oil;
8. Many rags for the inevitable spills.

In addition to these items there are several others which are not absolutely necessary, but handy to have around. These include a transmission funnel and filler tube, a drop (trouble) light on a long cord, an adjustable wrench (crescent wrench), and slip joint pliers.

A more extensive list of tools, suitable for tune-up work, can be drawn

up easily. While the tools involved are slightly more sophisticated, they need not be outrageously expensive. For example, there are several inexpensive tach/dwell meters on the market that are every bit as good for the average mechanic as a \$100.00 professional model. The key to these purchases is to make them with an eye towards adaptability and wide range. Using the tach/dwell meter example again, if the model you buy runs up to at least 1,500 rpm on the tachometer scale, the dwell meter works on 4, 6, or 8 cylinder engines, and the tachometer unit is adaptable to both conventional and electronic ignitions, it will serve for a long time on a variety of automobiles. A basic list of tune-up tools could include:

1. A tach/dwell meter;
2. Spark plug gauge and gapping tool;
3. Feeler blades;
4. Timing light.

In this list, the choice of a timing light should be made carefully. A light which works on the DC current supplied by the car battery is the best choice; it should have a xenon tube for brightness. If your car has electronic ignition, the light should have an inductive pick-up (the timing light illustrated has one of these), and since nearly all cars will have electronic ignition in the future, this feature is a reasonable one to look for.

In addition to these basic tools, there are several other tools and gauges you may find useful. These include:

1. A compression gauge. The screw-in type is slower to use, but eliminates the possibility of a faulty reading due to escaping pressure.
2. A manifold vacuum gauge.
3. A test light.
4. An induction meter. This is used

16 TOOLS AND EQUIPMENT

A basic tool collection will handle almost any automotive repair work

to determine whether or not there is current flowing in a wire, and thus is extremely helpful in electrical troubleshooting.

Finally, you will probably find a torque wrench necessary for all but in the most basic of work. The beam type models are perfectly adequate, although the newer click (break-away) type are more precise. Whichever type you choose, plan on having it recalibrated every once in a while.

Special Tools

Several procedures in this manual refer to special tools needed to make repairs or adjustments. These tools can be purchased from the following companies:

AMC, GM
Special Tool Division
Kent-Moore Corp.
29784 Little Mack
Roseville, MI 48066

Ford
Owatonna Tool Co.
Owatonna, MN 55060

Chrysler
Miller Special Tools
A Division of Utica Tool Co.
32615 Park Lane
Garden City, MI 48135

SPECIAL TEST EQUIPMENT

A variety of diagnostic tools are available to help troubleshoot and repair computerized engine and emission control systems. The most sophisticated of these devices are the console-type engine analyzers that usually occupy a garage service bay, but there are several types of aftermarket electronic testers available that will allow quick circuit tests of the engine control system by plugging directly into a special test connector located in the engine compartment or under the dashboard. Several tool and equipment manufacturers offer simple, hand-held testers that measure various circuit voltage levels on command to check all system components for proper operation. Although these testers usually cost about \$300-500, consider that the average computer-controlled carburetor can cost twice as much and the money saved by not replacing perfectly good sensors in an attempt to correct a problem could justify the purchase price of a special diagnostic tester.

These testers can allow quick and easy test measurements while the en-

Aftermarket hand-held testers can make diagnosing computer-controlled systems easier

Throttle body fuel injector tester

Special key for activating GM on-board diagnosis system. Insert the prongs into the diagnostic test terminals located under the dash

gine is operating or while the car is being driven. In addition, the on-board computer memory can be read to access any stored trouble codes; in effect allowing the computer to tell you where it hurts and aid trouble diagnosis by pinpointing exactly which circuit or component is malfunctioning. In the same manner, repairs can be tested to make sure the problem has been corrected. The biggest advantage these special testers have is their relatively easy hookups that minimize or eliminate the chances of making the wrong connections and getting false voltage readings or damaging the on-board computer.

NOTE: It should be remembered that these testers check voltage levels in circuits; they don't detect mechanical problems or failed components if the circuit voltage falls within the preprogrammed limits stored in the tester PROM unit. Also, most of the

hand-held testers are designed to work only on one or two systems made by a specific manufacturer.

A variety of aftermarket testers are available to help diagnose different computerized engine control systems. Owatonna Tool Company (OTC), for example, markets a device called the OTC Monitor 2000 which plugs directly into the assembly line diagnostic link (ALDL). When the correct manufacturer cartridge is plugged into the unit, the OTC tester makes diagnosis a simple matter of pressing the correct buttons. An adapter is supplied with the tester to allow connection to all types of ALDL links, regardless of the number of pin terminals used.

Servicing Your Car Safely

It is virtually impossible to anticipate all of the hazards involved with automotive maintenance and service, but care and common sense will prevent most accidents. The rules of safety for mechanics range from "don't smoke around gasoline," to "use the proper tool for the job." The trick to avoiding injuries is to develop safe work habits and take every possible precaution.

Any computer-based electronic engine control system is extremely sensitive to electrical voltages and cannot tolerate careless or haphazard testing or service procedures. An inexperienced individual can literally do major damage looking for a minor problem by using the wrong kind of test equipment or connecting test leads or connectors with the ignition switch ON. When selecting test equipment, make sure the manufacturers instructions state that the tester is compatible with whatever type of electronic control system is being serviced. Read all instructions carefully and double check all test points before installing probes or making any connections.

Aftermarket electronic testers are available from a variety of sources, as well as from the manufacturer, but care should be taken that the test equipment being used is designed to diagnose a particular system accurately without damaging the control unit (ECU) or components being tested.

DO'S

- DO keep a fire extinguisher and first aid kit within easy reach.
- DO wear safety glasses or goggles when cutting, drilling, grinding or prying, even if you have 20-20 vi-

16 TOOLS AND EQUIPMENT

sion. If you wear glasses for the sake of vision, they should be made of hardened glass that can serve also as safety glasses, or wear safety goggles over your regular glasses.

- DO shield your eyes whenever you work around the battery. Batteries contain sulphuric acid. In case of contact with the eyes or skin, flush the area with water or a mixture of water and baking soda and get medical attention immediately.
- DO remove the battery cables before charging the battery. Never use a high-output charger on an installed battery or attempt to use any type of "hot shot" (24 volt) starting aid.
- DO use safety stands for any undercar service. Jacks are for raising vehicles; safety stands are for making sure the vehicle stays raised until you want it to come down. Whenever the car is raised, block the wheels remaining on the ground and set the parking brake.
- DO use adequate ventilation when working with any chemicals or hazardous materials. Follow the manufacturer's directions for usage. Brake fluid, anti-freeze, solvents, paints, etc. are all deadly poisons if taken internally. Seal the containers tightly after use and store them safely, out of the reach of children.
- DO use caution when working on clutches or brakes. The asbestos used in the friction material will cause lung cancer if inhaled. Wipe the component with a damp rag to remove dust, and dispose of the rag after use.
- DO disconnect the negative battery cable when working on the electrical system. The secondary ignition system can contain up to 40,000 volts.
- DO properly maintain your tools. Loose hammerheads, mushroomed punches and chisels, frayed or poorly grounded electrical cords, excessively worn screwdrivers, spread open-end wrenches, cracked sockets, slipping ratchets, or faulty droplight sockets can cause accidents.
- DO use the proper size and type of tool for the job being done.
- DO when possible, pull on a wrench handle rather than push on it, and adjust your stance to prevent a fall.
- DO be sure that adjustable

wrenches are tightly closed on the nut or bolt and pulled so that the face is on the side of the fixed jaw.

- DO select a wrench or socket that fits the nut or bolt. The wrench or socket should sit straight, not cocked.
- DO strike squarely with a hammer; avoid glancing blows.
- DO set the parking brake and block the drive wheels if the work requires the engine running.
- DO depressurize the fuel system before attempting to disconnect any fuel lines. Although only fuel injection vehicles use a pressurized fuel system, it's a good idea to exercise caution whenever disconnecting any fuel line or hose during service procedures. Take precautions to avoid a fire hazard.
- DO use clean rags and tools when working on an open fuel system and take care to prevent any dirt from entering the system. Wipe all components clean before installation and prepare a clean work area for disassembly and inspection of components. Use lint-free cloths to wipe components and avoid using any caustic cleaning solvents.
- DO remove the electronic control unit (on-board computer) if the vehicle is to be placed in an environment where temperatures exceed approximately 176°F (80°C), such as a paint spray booth or when arc or gas welding near the control unit location in the car.

DON'TS

- DON'T run an engine in a garage or anywhere else without proper ventilation—EVER! Carbon monoxide is poisonous; it takes a long time to leave the human body and you can build up a deadly supply of it in your system by simply breathing in a little every day. You may not realize you are slowly poisoning yourself. Always use power vents, windows, fans or open the garage doors.
- DON'T work around moving parts while wearing a necktie or other loose clothing. Short sleeves are much safer than long, loose sleeves; hard-toed shoes with neoprene soles protect your toes and give a better grip on slippery surfaces. Jewelry such as watches, rings, fancy belt buckles, beads or body adornment

of any kind is not safe working around a car. Long hair should be hidden under a hat or cap.

- DON'T use pockets for toolboxes. A fall or bump can drive a screwdriver deep into your body. Even a wiping cloth hanging from the back pocket can wrap around a spinning shaft or fan.

- DON'T smoke when working around gasoline, cleaning solvent or other flammable material.

- DON'T use gasoline to wash your hands; there are excellent soaps available. Gasoline may contain lead, and lead can enter the body through a cut, accumulating in the body until you are very ill. Gasoline also removes all the natural oils from the skin so that bone dry hands will suck up oil and grease.
- DON'T service the air conditioning system unless you are equipped with the necessary tools and training. The refrigerant, R-12, is extremely cold when compressed, and when released into the air will instantly freeze any surface it contacts, including your eyes. Although the refrigerant is normally non-toxic, R-12 becomes a deadly poisonous gas in the presence of an open flame. One good whiff of the vapors from burning refrigerant can be fatal.

- DON'T install or remove battery cables with the key ON or the engine running. Jumper cables should be connected with the key OFF to avoid power surges that can damage electronic control units. Engines equipped with computer controlled systems should avoid both giving and getting jump starts due to the possibility of serious damage to components from arcing in the engine compartment when connections are made with the ignition ON.

- DON'T remove or attach wiring harness connectors with the ignition switch ON, especially to the electronic control unit.

- DON'T drop any components during service procedures and never apply 12 volts directly to any component (like a fuel injector) unless instructed specifically to do so. Some component electrical windings are designed to safely handle only 4 or 5 volts and can be destroyed in seconds if 12 volts are applied directly to the connector.

DOMESTIC CHARGING SYSTEMS

Electrical Diagnosis

To satisfy the growing trend toward organized engine diagnosis and tune-up, the following gauge and meter hook-ups, as well as diagnosis procedures are covered. The most sophisticated tune-up and diagnostic facilities are no more than a complex of the basic gauges and meters in common, everyday use. Therefore, to understand gauge and meter hook-ups, their applications and procedures, is to be equipped with the know how to perform the most exacting diagnosis.

Test Instruments

OHMMETER

An ohmmeter is used to measure electrical resistance in a unit or circuit. The ohmmeter has a self contained power supply. In use, it is connected across (or in parallel with) the terminals of the unit being tested.

AMMETER

An ammeter is used to measure the amount of electricity flowing through a unit, or circuit. Ammeters are always connected in series with the unit or circuit being tested.

VOLTMETER

A voltmeter is used to measure voltage pushing the current through a unit, or circuit. The meter is connected across the terminals of the unit being tested.

Alternator Testing

Diagnosis

The first step in diagnosing troubles of the charging system, is to identify the source of failure. Does the fault lie in the alternator or the regulator? The next move depends upon preference or necessity, either repair or replace the defective unit.

If the system is equipped with an external voltage regulator, it is easy to separate an alternator, electrically, from the regulator. Alternator output is controlled by the amount of current supplied to the field circuit of the system.

Checking field circuit current draw—as a precaution, a field rheostat should be used to control the amount of current allowed to pass through the circuit during isolation test

Checking current output of the charging system—if an overcharge of 10–15 amps is indicated, check for a faulty regulator

Checking charging system resistance to determine the amount of voltage drop between the alternator output terminal wire and the battery

An alternator is capable of producing substantial current at idle speed. Higher maximum output is also a possibility. This presents a potential danger when testing. As a precaution, a field rheostat should be used in the field circuit when making the following isolation test. The field rheostat permits positive control of the amount of current allowed to pass through the field circuit during the isolation test. Unregulated alternator capacity could ruin the unit.

Most manufacturers of precision gauges offer special test connectors, in sets, that will adapt to the leads and connections of any charging system.

Alternator Test Plans

The following is a procedure pattern for testing the various alternators and their control systems.

There are certain precautionary measures that apply to alternator tests in general. These items are listed in detail to avoid repetition when testing each make of alternator and to encourage a habit of good test procedure.

1. Check alternator drive belt for condition and tension.
2. Disconnect the battery cables.

Check physical, chemical and electrical condition of battery.

3. Be absolutely sure of polarity before connecting any battery in the circuit. Reversed polarity will ruin the diodes.

4. Never use a battery charger to start the engine.

5. Disconnect both battery cables when making a battery recharge hook-up.

6. Be sure of polarity hook-up when using a booster battery for starting.

7. Never ground the alternator output or battery terminal.

8. Never ground the field circuit between alternator and regulator.

9. Never run any alternator on an open circuit with the field energized.

10. Never try to polarize an alternator, unless directed by the manufacturer.

11. Do not attempt to motor an alternator.

12. When making engine idle speed adjustments, always consider potential load factors that influence engine rpm. To compensate for electrical load, switch ON the lights, radio, heater, air conditioner, etc.

Low or No Charging

1. Blown fuse
2. Broken or loose fan belt
3. Voltage regulator not working
4. Brushes sticking
5. Slip ring dirty
6. Open circuit
7. Faulty wiring connections
8. Faulty diode rectifier
9. High resistance in charging circuit
10. Grounded stator
11. May be open rectifiers (check all 3 phases)
12. If rectifiers are found or open, check capacitor

Noisy Unit

1. Damaged rotor bearings
2. Poor alignment of unit
3. Broken or loose belt
4. Open diode rectifiers.

CHRYSLER CORPORATION

Chrysler 60 Amp, 78 Amp and 114 Amp Alternator with External Regulator

The 60 and 78 amp alternators are

equipped with 6 built-in silicon rectifiers, while the 114 amp alternator is equipped with 12 built-in silicon rectifiers.

ON VEHICLE SERVICE

System Operation

NOTE: If the current indicator is to give an accurate reading, the battery cables must be of the same gauge and length as the original equipment.

1. With the engine running and all electrical systems **OFF**, place a current indicator over the positive battery cable.

2. If a charge of about 5 amps is recorded, the charging system is working. If a draw of about 5 amps is recorded the system is not working. The needle moves toward the battery when a charge condition is indicated and away from the battery when a draw condition is indicated. If a draw is indicated, proceed to the next testing procedure. If an overcharge of 10-15 amps is indicated, check for a faulty regulator.

Ignition Switch to Regulator Circuit Check

1. Disconnect the regulator wires at the regulator.

2. Turn the key **ON** but do not start the engine.

3. Using a voltmeter or test light check for voltage across the I and F terminals. If there is current present the circuit is good. If there is no current check for faulty connections, a faulty ballast resistor, a faulty ammeter, broken wires or a faulty ground at the alternator or voltage regulator. Also, check for voltage from the I wire to ground, current should be present. Check for voltage from the F terminal to ground, current should not be present.

Isolation Check

This test determines whether the regulator or alternator is faulty if everything else in the circuit was ok.

1. Disconnect, at the alternator, the wire that runs between 1 of the alternator field connections and the voltage regulator.

2. Run a jumper wire from the disconnected alternator terminal to ground.

3. Connect a voltmeter to the battery. The positive voltmeter lead connects to the positive battery terminal and the negative lead goes to the negative terminal. Record the reading.

4. Make sure that all electrical systems are turned **OFF**. Start the engine. Do not race the engine.

5. Gradually increase engine speed to 1500-2000 rpm. There should be an increase of 1-2 volts on the voltmeter. If this is true the alternator is good and the voltage regulator should be repaired. If there is no voltage increase the alternator is faulty.

Charging Circuit Resistance Check

The purpose of this test is to determine the amount of voltage drop between the alternator output terminal wire and the battery.

1. Disconnect the battery ground cable and the BAT lead at the alternator output terminal.

2. Connect an ammeter with a scale to 100 amps in series between the alternator BAT terminal and the disconnected BAT wire.

3. Connect the positive lead of a voltmeter to the disconnected BAT wire. Connect the negative lead of the voltmeter to the negative post of the battery.

4. Disconnect the green colored regulator field wire from the alternator. Connect a jumper lead from the alternator field terminal to ground.

5. Connect a tachometer to the engine and reconnect the battery ground cable.

6. Connect a variable carbon pile rheostat to the battery cables. Be sure

Chrysler 60, 78 and 114 amp alternators with external voltage regulator—charging system resistance test—adjust engine speed and carbon pile to maintain 20 amps, voltmeter reading should not exceed 0.5 volts

17 CHARGING AND STARTING DOMESTIC

Chrysler 60, 78 and 144 amp alternators with external voltage regulator—current output test—adjust engine speed and carbon pile increments until an engine speed of 1250 rpm is reached, voltmeter reading should not exceed 15 volts

the carbon pile is in the **OPEN** or **OFF** position before connecting the leads to the battery terminals.

7. Start the engine and operate at idle.

8. Adjust the engine speed and carbon pile to maintain a flow of 20 amperes in the circuit. Observe the voltmeter reading which should not exceed 0.7 volts.

9. If a higher voltage reading is indicated inspect, clean and tighten all connections in the charging system.

10. If necessary a voltage drop test can be done at each connection until the excessive resistance is located.

11. If the charging system resistance is within specifications reduce the engine speed, turn **OFF** the carbon pile rheostat and stop the engine. Remove battery ground cable.

12. Remove the test instruments from the electrical system and reconnect the charging system wiring. Reconnect the battery ground cable.

Current Output Check

This test determines if the alternator is capable of delivering its rated current output.

1. Disconnect the battery ground cable and the BAT lead wire at the alternator output terminal.

2. Connect an ammeter in series between the alternator output terminal

and the disconnected BAT lead wire. The ammeter must have a scale of 100 amps.

3. Connect the positive lead of a voltmeter to the output terminal of the alternator and the negative lead to a good ground.

4. Disconnect the green colored wire at the voltage regulator and connect a jumper wire from the alternator field terminal to ground.

5. Connect a tachometer to the engine and reconnect the battery ground wire.

6. Connect a variable carbon pile rheostat between the positive and negative battery cables. Be sure the rheostat control is in the **OPEN** or **OFF** position before connecting the leads to the battery cables.

7. Start the engine and operate at idle. Adjust the carbon pile rheostat control and the engine speed in increments until the voltmeter reading is 15 volts (13 volts for the 114 amp al-

ternators) and the engine speed is 1250 rpm (900 rpm for the 114 amp alternators). Do not allow the voltage to rise above 16 volts.

8. The ammeter readings must be within the following specifications.

NOTE: If measured at the battery, current output will be approximately 5 amperes lower than specified.

9. If the readings are less than specified, the alternator should be removed and checked during a bench test.

10. After the current output test is completed, reduce the engine speed, turn the carbon pile rheostat **OFF** and then stop the engine.

11. Disconnect the battery ground cable, remove the ammeter, voltmeter and carbon pile. Remove the jumper wire from the field terminal and reconnect the green colored wire to the alternator field terminal.

Current Rating	Identification	Current Output
60 amp	Blue, natural or yellow	47 amps min.
78 amp	Brown tag	58 amps min.
114 amp	Yellow	97 amps min.

Current rating chart

Chrysler 60, 78 and 114 amp alternators with external voltage regulator—voltage regulator test—idle engine at 1250 rpm with all lights and accessories off, voltmeter readings should equal shown in table

Chrysler alternator with external regulator—rotor field coil current draw test. Connect ammeter as shown, rotate alternator pulley slowly by hand and observe the field coil draw reading.

12. Reconnect the battery cable, if no further testing is to be done to the charging circuit.

Rotor Field Coil Draw Check

1. If on the vehicles remove the drive belt and wiring connections from the alternator.
2. Connect a jumper wire from the negative terminal of the battery to 1 of the field terminals of the alternator.
3. Connect the test ammeter positive lead to the other field terminal of

the alternator and the negative ammeter lead to the positive battery terminal.

4. Connect a jumper wire between the alternator end shield and the battery negative terminal.

5. Slowly rotate the alternator pulley by hand and observe the ammeter reading.

6. The field coil draw should be 4.5–6.5 amperes at 12 volts. (4.75–6.0 amperes at 12 volts 114 amp alternators).

7. A low rotor coil draw is an indication of high resistance in the field coil circuit (brushes, slip-rings or rotor coil). A higher rotor coil draw indicates possible shorted rotor coil or grounded rotor. No reading indicates an open rotor or defective brushes.

8. Remove the test equipment and jumper leads.

Electronic Voltage Regulator Check

1. Make sure battery terminals are clean and battery is charged.
2. Connect the positive lead of a test voltmeter to ignition terminal No. 1 of the ballast resistor.
3. Connect the negative voltmeter lead to a good body ground.
4. Start engine and allow it to idle at 1250 rpm, all lights and accessories turned **OFF**. Voltage should be as in-

dicated in the figure of the voltage regulator test.

5. If the voltage is below specification check the following. Voltage regulator ground check, voltage drop between regulator cover and ground. Harness wiring, disconnect regulator plug (ignition switch **OFF**), then turn **ON** ignition switch and check for battery voltage at the terminals having the red and green leads. Wiring harness must be disconnected from the regulator when checking individual leads. If no voltage is present in either lead the problem is in the wiring or alternator field.

6. If Step 5 tests showed no malfunctions, install a new regulator and repeat Step 4.

7. If voltage is above specifications (Step 4), or fluctuates, check the following. Ground between regulator and body, between body and engine. Ignition switch circuit between switch and regulator.

8. If voltage is still more than $\frac{1}{2}$ volt above specifications install a new regulator and repeat Step 4.

ALTERNATOR OVERHAUL

Alternator disassembly, repair and assembly procedures are basically the same for all Chrysler alternators. Certain variations in design, or produc-

Typical Chrysler alternator—showing assembly sequence of components

tion modifications, could require slightly different procedures that should be obvious upon inspection of the unit being serviced.

Disassembly

To prevent damage to the brush assemblies (114 amp), they should be removed before proceeding with the disassembly of the alternator. The brushes are mounted in a plastic holder that positions the brushes vertically against the slip-rings.

1. Remove the retaining screw, flat washer, nylon washer and field terminal and carefully lift the plastic holder containing the spring and brush assembly from the end housing.

2. The ground brush (60 amp) is positioned horizontally against the slip-ring and is retained in the holder that is integral with the end housing. Remove the retaining screw and lift the clip, spring and brush assembly from the end housing. The stator is laminated so don't burr the stator or end housings.

3. Remove the through bolts and pry between the stator and drive end housing with a suitable tool. Carefully separate the drive end housing, pulley and rotor assembly from the stator and rectifier housing assembly.

4. The pulley is an interference fit on the rotor shaft. Remove with a puller and special adapters.

5. Remove the nuts and washers and, while supporting the end frame, tap the rotor shaft with a plastic hammer and separate the rotor and end housing.

6. The drive end ball bearing is an interference fit with the rotor shaft. Remove the bearing with puller and adapters.

NOTE: Further dismantling of the rotor is not advisable, as the remainder of the rotor assembly is not serviced separately.

7. Remove the DC output terminal nuts and washers and remove terminal screw and inside capacitor (on units so equipped).

8. Remove the insulator.

NOTE: Positive rectifiers are pressed into the heat sink and negative rectifiers in the end housing. When removing the rectifiers it is necessary to support the end housing and the heat sink in order to prevent damage to the castings. Do not subject the diode rectifiers to unnecessary jolting. Heavy vibration or shock may ruin them. Cut rectifier wire at point of crimp. Support rectifier housing. The factory tool is cut away and slotted to fit over the wires and around the bosses in the housing. Be sure the bore of the tool completely surrounds the rectifier, then press the rectifier out of the housing. The roller bearing in the rectifier end frame is a press fit. To protect the end housing, it is necessary to support the housing with a tool when pressing out the bearing.

Inspection

RECTIFIERS OPEN IN ALL 3 PHASES

Testing with Ohmmeter

Disassemble the alternator and separate the wires at the Y-connection of the stator.

There are 6 diode rectifiers mounted in the back of the alternator (60 amp). Three of them are marked with a plus (+) and 3 are marked with a minus (-). These marks indicate diode case polarity. The 114 amp alternator has 12 silicon diodes; 6 positive and 6 negative.

To test, set ohmmeter to its lowest range. If case is marked positive (+), place positive meter probe to case and negative probe to the diode lead. Meter should read between 4-10 ohms. Now, reverse leads of ohmmeter, connecting negative meter probe to positive case and positive meter probe to wire of rectifier. Set meter on a high range. Meter needle should move very little, if any (infinite reading). Do this to all positive diode rectifiers.

The diode rectifiers with minus (-) marks on their cases are checked the same way as above. Only now the negative ohmmeter probe is connected to the case for a reading of 4-10 ohms. Reverse leads as above for the other part to test. If a reading of 4-10 ohms

Chrysler alternator rear housing showing locations of rectifiers and field bushings

Positive rectifier assembly—114 amp alternator—note position of insulators. Positive rectifier is pressed into the heat sink

Chrysler alternator with external regulator removing alternator field brush (vertical)

Chrysler alternator with external regulator—separating alternator drive end shield from stator, using a prybar

is obtained in 1 direction and no reading (infinity) is read on the ohmmeter in the other direction, diode rectifiers are good. If either infinity or a low resistance is obtained in both directions on a rectifier it must be replaced. If meter reads more than 10 ohms when ohmmeter positive probe is connected to positive on diode and negative probe

View of the rear housing terminal location—Chrysler alternator 114 amp

Chrysler alternator with external regulator testing the rotor for short circuit or open circuits using a 110 volt AC test bulb

Chrysler alternator with external regulator—positive and negative rectifier identification—note the different types are not interchangeable

Negative rectifier assembly—114 amp alternator. Negative rectifier is pressed into the end housing

Chrysler alternator with external regulator—heat sink and rectifier assembly removal—note location of studs

to negative diode, replace diode rectifier.

NOTE: With this test it is necessary to determine the polarity of the ohmmeter probes. This can be done by connecting the ohmmeter to a DC voltmeter. The voltmeter

will read up scale when the positive probe of the ohmmeter is connected to the positive side of the voltmeter and the negative probe of the ohmmeter is connected to the negative side of the voltmeter.

Alternate Method with Test Lamp

Be sure that the lead from the center of the diode rectifiers is disconnected. To test rectifiers with positive cases, touch the positive probe of tester to case and the negative probe to lead wire of rectifier. Bulb should light if rectifier is good. If bulb does not light, replace rectifier. Now reverse tester probe connections to rectifier. Bulb should not light. If bulb does light, replace rectifier. For testing minus (–) marked cases follow the above procedure except that now bulb should light with negative probe of tester touching rectifier case and positive probe touching lead wire. Rectifier is good if the bulb lights when tester probes are connected one way and does not light when tester connections are reversed. Rectifier must be replaced if the bulb does not light either way. Also, replace rectifier if bulb lights both ways.

NOTE: The usual cause of an open diode or rectifier is a defective capacitor or a battery that has been installed in reverse polarity. If the battery is installed properly and the diodes are open, test the capacitor.

FIELD COIL DRAW TEST

1. Connect a jumper between one FLD terminal and the positive terminal of a fully charged 12 volt battery.
2. Connect the positive lead of a test ammeter to the other field (Fld) terminal and the negative test lead to the negative battery terminal.

3. Slowly rotate the rotor by hand and observe the ammeter. The proper field coil draw is 2.3–2.7 amps at 12 volts.

NOTE: Field coil draw for the 114 ampere alternators should be 4.75–6.0 amperes at 12 volts.

Chrysler alternator with external regulator—location of negative and positive rectifiers check part number of rectifier to be sure correct rectifier is being used

Chrysler alternator with external regulator—testing the stator for grounding using a 110 volt test lamp if lamp lights stator is grounded and must be replaced

FIELD CIRCUIT GROUND TEST

1. Touch a test lead of a 110 volt AC test bulb to 1 of the alternator brush (field) terminals and the other test lead to the end shield.

2. If the lamp lights, remove the field brush assemblies and separate the end housing by removing the through bolts.

TROUBLESHOOTING CHRYSLER ISOLATED FIELD ALTERNATOR (WITH EXTERNAL ELECTRONIC REGULATOR)

3. Place one test lead on a slip-ring and the other on the end shield.

4. If the lamp lights, the rotor assembly is grounded internally and must be replaced.

5. If the lamp does not light, the cause of the problem was a grounded brush.

GROUNDING STATOR

1. Disconnect the diode rectifiers from the stator leads.

2. Test from stator leads to stator core, using a 110 volt test lamp. Test lamp should not light. If it does, the stator is grounded and must be replaced.

LOW OUTPUT TEST

About 50% output accompanied with a growl-hum caused by a shorted phase or a shorted rectifier. If the rectifiers are found to be within specifications replace the stator assembly.

If the rectifier tests satisfactorily, inspect the stator connections before replacing the stator.

Assembly

1. Support the heat sink or rectifier end housing on circular plate.

2. Check rectifier identification to be sure the correct rectifier is being used. The part numbers are stamped on the case of the rectifier. They are also marked red for positive and black for negative.

3. Start the new rectifier into the casting and press it in squarely. Do not start rectifier with a hammer or it will be ruined.

4. Crimp the new rectifier wire to the wires disconnected at removal or solder using a heat sink with rosin core solder.

5. Support the end housing on tool so that the notch in the support tool will clear the raised section of the heat sink, press the bearing into position with tool SP-3381, or equivalent. New bearings are prelubricated, additional lubrication is not required.

6. Insert the drive end bearing in the drive end housing and install the bearing plate, washers and nuts to hold the bearing in place.

7. Position the bearing and drive end housing on the rotor shaft and, while supporting the base of the rotor shaft, press the bearing and housing in position on the rotor shaft with an arbor press and arbor tool. Be careful that there is no cocking of the bearing at installation; or damage will result. Press the bearing on the rotor shaft until the bearing contacts the shoulder on the rotor shaft.

8. Install pulley on rotor shaft. Shaft of rotor must be supported so that all pressing force is on the pulley hub and rotor shaft. Do not exceed 6800 lbs. pressure. Pulley hub should just contact bearing inner race.

9. Some alternators will be found to have the capacitor mounted internally. Be sure the heat sink insulator is in place.

10. Install the output terminal screw with the capacitor attached through the heat sink and end housing.

11. Install insulating washers, lock-washers and locknuts.

12. Make sure the heat sink and insulator are in place and tighten the locknut.

13. Position the stator on the rectifier end housing. Be sure that all of the rectifier connectors and phase leads are free of interference with the rotor fan blades and that the capacitor (internally mounted) lead has clearance.

14. Position the rotor assembly in the rectifier end housing. Align the through bolt holes in the stator with both end housings.

15. Enter stator shaft in the rectifier end housing bearing, compress stator and both end housings manually and install through bolts, washers and nuts.

16. Install the insulated brush and terminal attaching screw.

17. Install the ground screw and attaching screw.

18. Rotate pulley slowly to be sure the rotor fan blades do not hit the rectifier and stator connectors.

Chrysler 40/90 Amp and 50/120 Amp Alternator with External Electronic Regulator

The 40/90 alternator is used as standard equipment. A 50/120 alternator is optional.

ON VEHICLE SERVICE

Charging Circuit Resistance Test

1. Be sure that the battery is fully charged.

2. Turn OFF ignition switch.

3. Disconnect negative battery cable.

4. Disconnect BAT terminal wire from alternator output BAT terminal post.

5. Connect a 0-100 amps minimum range scale DC test ammeter in series between alternator BAT terminal and disconnected BAT terminal wire. Connect ammeter positive lead wire to alternator BAT terminal and negative ammeter lead to disconnected alternator BAT terminal wire.

6. Connect a 0-18 volt minimum range scale test voltmeter between disconnected alternator BAT terminal wire and positive battery cable. Connect voltmeter positive lead to disconnected alternator BAT terminal wire and negative voltmeter lead to battery positive cable.

7. Disconnect wiring harness connector from electronic voltage regulator on vehicle.

8. Connect a jumper wire from wiring harness connector green wire (outside terminal), to ground. Do not connect blue J2 lead of wiring connector to ground.

9. Connect an engine tachometer and reconnect negative battery cable. Connect a variable carbon pile rheostat to battery terminals. Be sure carbon pile is in **OPEN** or **OFF** position before connecting leads.

10. Start engine. Immediately after starting reduce engine speed to idle.

11. Adjust engine speed and carbon pile to maintain 20 amperes flowing in circuit. Observe voltmeter reading. Voltmeter reading should not exceed 0.5 volts.

NOTE: If a higher voltage drop is indicated, inspect, clean and tighten all connections in the charging circuit. A voltage drop test may be performed at each connection to locate connection with excessive resistance. If charging circuit resistance tested satisfactorily, reduce engine speed, turn OFF carbon pile and turn OFF ignition switch.

12. Disconnect negative battery cable.

13. Remove test ammeter, test voltmeter, variable carbon pile rheostat and engine tachometer.

14. Remove jumper wire connected between electronic voltage regulator wiring harness connector green wire terminal and ground.

15. Connect wiring harness connector to electronic voltage regulator.

16. Connect BAT terminal wire to alternator output BAT terminal.

17. Connect negative battery cable.

Current Output Test

1. Be sure that the battery is fully charged.

2. Turn OFF ignition switch.

3. Disconnect negative battery cable.

17 CHARGING AND STARTING DOMESTIC

Chrysler 90 and 120 amp alternators with external voltage regulator—charging system resistance test—adjust engine speed and carbon pile to maintain 20 amps, voltmeter reading should not exceed 0.5 volts

Chrysler 90 and 120 amp alternators with external voltage regulator—current output test—adjust engine speed and carbon pile increments until an engine speed of 1250 rpm is reached, voltmeter reading should not exceed 15 volts

4. Disconnect the output wire from the alternator BAT terminal. Connect a 0-100 ammeter positive lead wire to alternator BAT terminal and negative ammeter lead to disconnected alternator BAT terminal wire.

5. Connect a 0-18 volt minimum range scale test voltmeter between alternator BAT terminal post and ground. Connect voltmeter positive lead to alternator BAT terminal post. Connect negative lead of test voltmeter to a good ground.

6. Disconnect wiring harness connector from electronic voltage regulator on vehicle.

7. Connect a jumper wire from wiring harness connector green wire (outside terminal) to ground. Do not connect blue J2 lead of wiring connector to ground.

8. Connect an engine tachometer and reconnect negative battery cable. Connect a variable carbon pile rheostat between battery terminals. Be sure the carbon pile is in **OPEN** or **OFF** position before connecting leads.

9. Start the engine. Immediately after starting reduce engine speed to idle.

10. Adjust carbon pile and engine speed in increments until a speed of 1250 rpm and voltmeter reading of 15 volts is obtained. Do not allow voltage meter to read above 16 volts.

11. Ammeter reading must be within

the proper limits. If reading is less than specified alternator should be removed from vehicle and bench tested.

12. After current output test is completed reduce engine speed, turn **OFF** carbon pile and turn **OFF** ignition switch.

13. Disconnect negative battery cable.

14. Remove test ammeter, test voltmeter, tachometer and variable carbon pile rheostat.

15. Remove jumper wire connected between electronic voltage regulator wiring harness connector green wire terminal and ground.

16. Connect wiring harness connector to electronic voltage regulator.

17. Connect BAT terminal wire to alternator output BAT terminal.

18. Connect negative battery cable.

Voltage Regulator Test

1. Be sure that the battery is fully charged.

2. Turn **OFF** ignition switch.

3. Connect a 0-18 volts minimum range scale test voltmeter between vehicle battery and ground. Connect positive lead of voltmeter to positive battery cable terminal. Connect negative lead of voltmeter to a good vehicle body ground.

4. Connect a tachometer to engine.

5. Start engine and adjust engine

speed to 1250 rpm with all lights and accessories turned **OFF**.

6. Check voltmeter, regulator is working properly if voltage readings are in accordance with the voltage chart.

7. If voltage is below limits or is fluctuating, proceed as follows. Check for a good voltage regulator ground. Voltage regulator ground is obtained through regulator case to mounting screws and to sheet metal of vehicle. This is ground circuit that is to be checked for opens.

8. Turn **OFF** ignition switch and disconnect voltage regulator wiring harness connector. Be sure terminals of connector have not spread open to cause an open or intermittent connection.

9. Do not start engine or distort terminals with voltmeter probe: turn **ON** ignition switch and check for battery voltage at voltage regulator wiring harness connector terminals. Both blue and green terminals should read battery voltage. Turn **OFF** ignition switch.

10. If satisfactory, replace the regulator and repeat the test.

11. If the voltage is above limits specification proceed as follows. Turn **OFF** ignition switch and disconnect voltage regulator wiring harness connector. Be sure terminals in connector have not spread open.

Chrysler 90 and 120 amp alternators with external voltage regulator—voltage regulator test—Idle engine at 1250 rpm with all lights and accessories off, voltmeter readings should equal shown in table

17 CHARGING AND STARTING DOMESTIC

View of the rectifier end shield assembly bolts—Chrysler 90 and 120 amp alternator

View of the stator and drive end shield assemblies—Chrysler 90 and 120 amp alternator

12. Do not start engine or distort terminals with voltmeter probe. Turn **ON** ignition switch and check for battery voltage at voltage regulator wiring harness connector terminals. Both blue and green terminals should read battery voltage. Turn **OFF** ignition switch.

13. If satisfactory, then replace regulator and repeat test. Remove test voltmeter and tachometer.

ALTERNATOR OVERHAUL

Disassembly

1. Remove the rectifier dust cover nut and separate the cover from the alternator.

2. Remove the brush holder bolts and separate it from the alternator.

3. Remove the stator lead, the rectifier and capacitor bolts. Separate the rectifier and insulator from the alternator.

4. If disassembling a 50/120 alternator rectifier, perform the following procedures:

a. Remove the connecting strap from between the rectifiers.

b. Remove the buss bar and insulator screws.

c. Separate the insulators from the rectifier.

5. From the shield end, remove the through bolts.

6. From the drive end shield, separate the stator and rectifier end shield.

7. Separate the stator from the rectifier end shield.

8. Remove the drive pulley nut, the washer, the pulley and the fan.

9. Press the rotor shaft from the drive end shield.

NOTE: If the bearing is defective, replace the drive end shield as an assembly.

10. If necessary to remove the rectifier end bearing from the rotor assembly, use a bearing puller to press the bearing from the rotor shaft.

Inspection

BRUSH HOLDER TESTS

1. Make sure the brushes move smoothly and return fully to the stops when released; if not, replace the brush holder assembly.

2. Using an ohmmeter, test inner brush-to-field terminals continuity; a field terminal should be open and the other closed. If not, replace the brush holder.

3. Using an ohmmeter, test outer brush-to-field terminals continuity; 1 field terminal should be open and the other closed. If not, replace the brush holder.

ROTOR TESTS

1. Check the field slip rings for excessive wear or roughness; fine emery cloth may be used to repair minor damage. If the rings are excessively damaged, replace the rotor.

2. Using an ohmmeter, test for continuity between the slip rings; the circuit should be closed. If not, replace the rotor.

3. Using an ohmmeter, test for continuity between the slip rings and the rotor shaft or core; the circuit should be open. If not, replace the rotor.

STATOR TESTS

1. Check the stator for signs damage—weak or broken leads, distorted frame or burned windings; if necessary, replace the stator.

NOTE: Using a scraping device, clean a portion of the stator frame to assure good electrical contact.

2. Using an ohmmeter, test for continuity between the stator leads and frame; the circuit should be open. If not, replace the stator.

3. Using an ohmmeter, test for continuity between the stator leads; the circuit should be closed. If not, replace the stator.

RECTIFIER TESTS

1. Separate the positive diode leads from the negative diode leads.

2. Using an ohmmeter, test for continuity between the positive heat sink to each of the positive diode leads. Reverse the test probes and repeat the test; the diodes should show continuity in 1 direction. If not, replace the rectifier assembly.

3. Using an ohmmeter, test for continuity between the negative heat sink to each of the negative diode leads. Reverse the test probes and repeat the test; the diodes should show continuity in 1 direction. If not, replace the rectifier assembly.

Assembly

1. If the rectifier end bearing was removed, support the rotor assembly in a holding fixture and drive the bearing onto the rotor shaft with a bearing driver.

2. Press the drive end shield onto the rotor shaft and install the fan, the pulley, the washer and the drive pulley nut.

3. Assemble the stator to the rectifier end shield and the stator to the drive end shield. Install the through bolts.

4. If assembling a 50/120 alternator rectifier, perform the following procedures:

a. Install the insulators on the rectifier.

b. Install the insulator screws and the buss bar.

c. Attach the connecting strap between the rectifiers.

5. Assemble the rectifier and insulator to the alternator. Install the capacitor, the rectifier and the stator lead bolts.

6. Install the brush holder and tighten the bolts.

7. Install the rectifier dust cover and nut.

Chrysler 40/90 Amp and 50/120 Amp Alternator with Voltage Regulator in Engine Electronics

The charging system consists of a battery, alternator, voltmeter and connecting wires. The 40/90 has 6 built-in silicon rectifiers, while the 50/120 has 12 built-in silicon rectifiers. The voltage regulator is built into the power and logic modules. The rectifiers convert AC current into DC current. Cur-

Alternator electrical schematic—Chrysler 50/120 amp

Alternator electrical schematic—Chrysler 40/90 amp

rent at the alternator battery terminal is DC. The alternator's main components are rotor, stator, capacitor, rectifiers, end shields, brushes, bearings, poly-vee drive pulley and fan.

The electronic voltage regulator is contained within engine electronics power module and logic module. It is a device that regulates vehicle electrical system voltage by limiting output voltage that is generated by the alternator. This is accomplished by controlling

amount of current that is allowed to pass through alternator field winding. The alternator field is turned **ON** by a driver in power module which is controlled by a predriver in the logic module. The logic module looks at battery temperature to determine control voltage. The field is then driven at a duty cycle proportional to the difference between battery voltage and desired control voltage. One important feature of the electronic regulator is the ability of

its control circuit to vary regulated system voltage up or down as temperature changes. This provides varying charging conditions for battery throughout seasons of the year.

ON VEHICLE SERVICE

Resistance Test

Alternator output wire resistance test will show amount of voltage drop

17 CHARGING AND STARTING DOMESTIC

Chrysler 40/90 amp alternator with with engine electronics—output wire resistance test

across alternator output wire between alternator BAT terminal and positive battery post.

1. Before starting test, make sure vehicle has a fully charged battery.
2. Turn **OFF** ignition switch.
3. Disconnect negative battery cable.

4. Disconnect alternator output wire from alternator output battery terminal.

5. Connect a 0–150 ampere scale DC ammeter in series between alternator BAT terminal and disconnected alternator output wire. Connect positive lead to alternator BAT terminal and negative lead to disconnected alternator output wire.

6. Connect positive lead of a test voltmeter (Range 0–18 volts minimum) to disconnected alternator output wire. Connect negative lead of test voltmeter to positive battery cable at positive post.

7. Remove air hose between power and module and air cleaner.

8. Connect an end of a jumper wire to ground and with other end probe green R3 lead wire on dash side of black 8-way connector.

NOTE: Do not connect the blue J2 lead of the 8-way connector to ground. Both R3 and J2 leads are green on the alternator side of the 8-way connector. At the dash end of the connector, R3 is green and J2 is blue.

9. Connect an engine tachometer and reconnect negative battery cable.
10. Connect a variable carbon pile

rheostat between battery terminals. Be sure carbon pile is in **OPEN** or **OFF** position before connecting leads.

11. Start engine. Immediately after starting, reduce engine speed to idle. Adjust engine speed and carbon pile to maintain 20 amperes flowing in circuit. Observe voltmeter reading. Voltmeter reading should not exceed 0.5 volts.

12. If a higher voltage drop is indicated, inspect, clean and tighten all connections between alternator BAT terminal and positive battery post.

13. A voltage drop test may be performed at each connection to locate connection with excessive resistance. If resistance tested satisfactorily, reduce engine speed, turn **OFF** carbon pile and turn **OFF** ignition switch.

14. Disconnect negative battery cable. Remove test ammeter, voltmeter, carbon pile and tachometer. Remove jumper wire between 8-way black connector and ground.

15. Connect alternator output wire to alternator BAT terminal post. Tighten 45–75 inch lbs. Reconnect negative battery cable. Reconnect hose between power module and air cleaner.

Current Output Test

Current output test determines whether or not alternator is capable of delivering its rated current output.

1. Before starting any tests, make sure vehicle has a fully charged battery.

2. Disconnect negative battery cable.

3. Disconnect alternator output wire at the alternator battery terminal.

4. Connect a 0–150 ampere scale DC ammeter in series between alternator BAT terminal and disconnected alternator output wire. Connect positive lead to alternator BAT terminal and negative lead to disconnected alternator output wire.

5. Connect positive lead of a test voltmeter (range 0–18 volts minimum) to alternator BAT terminal.

6. Connect negative lead of test voltmeter to a good ground.

7. Connect an engine tachometer and reconnect negative battery cable.

8. Connect a variable carbon pile rheostat between battery terminals. Be sure carbon pile is in **OPEN** or **OFF** position before connecting leads.

9. Remove air hose between power module and air cleaner.

10. Connect 1 end of a jumper wire to ground and with other end probe green R3 lead wire on dash side of Black 8-way connector.

NOTE: Do not connect the blue J2 lead of the 8-way connector to ground. Both R3 and J2 leads are green on the alternator side of the 8-way connector. At the dash end of the connector, R3 is green and J2 is blue.

11. Start engine. Adjust carbon pile and engine speed in increments until a speed of 1250 rpm and voltmeter reading of 15 volts is obtained. Do not allow the voltage meter to read above 16 volts.

Chrysler 40/90 amp alternator with engine electronics — current output test

12. The ammeter reading must be within the proper limits.

13. If reading is less than specified and alternator output wire resistance is not excessive alternator should be removed from vehicle and bench tested.

14. After current output test is completed, reduce engine speed, turn **OFF** carbon pile and ignition switch. Disconnect negative battery cable.

15. Remove test ammeter, voltmeter, tachometer and carbon pile. Remove jumper wire between 8-way black connector and ground. Disconnect alternator output wire to alternator BAT terminal post.

16. Reconnect negative battery cable. Reconnect air hose between power module and air cleaner.

Voltage Regulator Test

On board diagnostic fault codes play a major role in case of a charging system failure.

Fault codes are 2 digit numbers that identify which circuit is at fault. In most cases, they do not identify which component in a circuit is at fault. Therefore, a fault code is only a result, not necessarily a reason for the problem. It is important that the test procedure be followed in order to understand the fault codes of the on-board diagnostic system.

DIAGNOSTIC READOUT BOX OPERATION

The diagnostic readout box is used to put the on-board diagnostic system in 3 different modes of testing as called

for in the driveability test procedure, only one of which is used in charging system diagnosis.

DIAGNOSTIC MODE

1. Connect diagnostic readout box C-4805 to the mating connector located in the wiring harness by right front shock tower.

2. Place read/hold switch on read-out box in **READ** position.

3. Turn ignition switch **ON/OFF**, **ON/OFF**, on within 5 seconds.

4. Record all codes, displaying of codes may be stopped by moving read/hold button to **HOLD** position. Returning to **READ** position will continue displaying of codes.

5. If for some reason diagnostic readout box is not available, logic module can show fault codes by means of flashing power loss lamp on instrument cluster.

HOW TO USE POWER LOSS OR POWER LIMIT LAMP FOR CODES

To activate this function, turn ignition key **ON/OFF/ON/OFF/ON** within 5 seconds. The power loss lamp will turn **ON** for 2 seconds as a bulb check. Immediately following this it will display a fault code by flashing on and off. There is a short pause between flashes and a longer pause between digits. All codes displayed are 2 digit numbers with a 4 second pause between codes. An example of a code is as follows.

1. Lamp on for 2 seconds then turns off.

2. Lamp flashes 4 times, pauses and flashes once.

3. Lamp pauses for 4 seconds, flashes 4 times, pauses and flashes 7 times.

4. The 2 codes are 41 and 47. Any number of codes can be displayed as long as they are in memory. The lamp will flash until all of them are displayed.

CHARGING SYSTEM FAULT CODES

Perform test procedure categories using the following guide lines.

1. Each category is made up of many tests. Always start at the first test of a category. Starting at any other test will only give incorrect results.

2. Each test may have many steps. Only perform steps indicated under action required. It is not necessary to perform all steps in a test.

3. At the end of each test (not step) reconnect all wires and turn the engine **OFF** and reinstall any components that were removed for testing.

4. The vehicle being tested must have a fully charged battery.

DIAGNOSTIC TESTING WITH READOUT BOX

Test 1

CHECKING BATTERY SENSING CIRCUIT CODE 16

This test will check for direct battery feed to logic module. Circuit is also memory feed to logic module. Code 16 with lower battery voltage will turn **ON** power loss lamp.

1. Turn the ignition switch **OFF**.
2. Disconnect the (black on EFI,

17 CHARGING AND STARTING DOMESTIC

Alternator fault code chart—Chrysler 40/90 amp and 50/120 amp

blue on turbocharged engines) connector from the logic module.

3. Connect a voltmeter to cavity No. 22 of logic module connector and ground.

4. Voltmeter should read within 1 volt of battery voltage. Voltage okay,

replace logic module. Before replacing logic module, make sure the terminal in cavity No. 22 is not crushed so that it cannot touch logic module pin.

5. Zero volts, repair wire of cavity No. 22 for an open circuit to the wiring harness splice.

Test 2

FAULT CODES 41 AND 46 CHECKING CHARGING SYSTEM Step A

1. Disconnect the power module 10-way connector.

2. Connect a voltmeter between cavity No. 8 of 10-way connector and ground.

3. Turn ignition switch to **RUN** position.

4. Voltmeter should read within 1 volt of battery voltage. Not within 0–1 volts, repair alternator field circuit for short to ground. Voltage okay, perform Step B.

Step B

1. Turn the ignition switch **OFF**.

2. Reconnect the power module 10-way connector.

3. Disconnect the power module 12-way connector.

4. Connect a voltmeter between F2 terminal on alternator and ground.

5. Turn the ignition switch to the **RUN** position.

6. Voltage should read within 1 volt of battery voltage. Not within 0–1 volt, replace power module. Voltage okay, perform Step C.

Step C

1. Turn the ignition switch **OFF**.

2. With power module 12-way connector disconnected.

3. Disconnect the logic module (white on EFI, red on turbocharged engines) connector.

4. Connect an ohmmeter between cavity No. 11 of power module 12-way connector and ground.

5. Ohmmeter should not show continuity. No continuity, replace logic module. Continuity repair wire of cavity No. 11 for short circuit to ground.

Test 3

CHECKING CODES 41 AND 47

Step A

1. Connect a voltmeter between battery positive and ground.

2. Connect an end of jumper wire to a good engine ground.

3. Start the engine and note reading of voltmeter.

4. Very quickly touch other end of jumper wire to F2 terminal on alternator and watch voltmeter.

5. Voltmeter should show an increase in voltage. Voltage increases, this indicates alternator is operating correctly. Move on to Step B, for field circuit check. Voltage does not increase, this indicates alternator is not operating. If this is the case, perform Step E which checks for voltage to alternator field.

Step B

1. Connect a voltmeter between cavity No. 2 of logic module (black on EFI, blue on turbocharged engines) connector and ground.

2. Connect an end of a jumper wire

to cavity No. 5 of the logic module white connector.

3. Very quickly touch other end of jumper wire to logic module mounting stud and watch voltmeter.

4. Voltmeter should show an increase in voltage. If voltage increases, this indicates all components of system, except logic module, are operating correctly.

5. Before replacing the logic module, be sure that the terminal in cavity No. 5 is not crushed so that it cannot touch the logic module pin. If terminal in cavity 5 is not damaged, replace logic module. If no increase is indicated, move on to Step C.

Step C

1. Turn the engine **OFF**.

2. Disconnect logic module (white on EFI, red on turbocharged engines) connector.

3. Connect a voltmeter between cavity No. 5 of logic module connector and ground.

4. Turn the ignition switch to **RUN** position. Voltmeter should read within 1 volt of battery voltage. Zero volts, disconnect power module 12-way and connect an ohmmeter between cavity 5 of logic module (white on EFI, red on turbocharged engines) connector and cavity 11 of power module. If open, repair wire or connector. If meter shows continuity replace power module. If voltage shown is within 1 volt of battery voltage, go on to Step D.

Step D

1. Turn ignition switch **OFF**.

2. Disconnect 10-way connector from power module.

3. Connect a voltmeter between cavity No. 8 of 10-way connector and ground.

4. Turn ignition switch to **RUN** position. Voltmeter should read within 1 volt of battery voltage. If voltage shown is within 1 volt of battery voltage, replace power module.

5. Zero volts, turn ignition switch **OFF** and place an ohmmeter between cavity 8 of power module 10-way connector and F2 terminal of alternator. If open, repair wire or connector. If meter shows continuity, proceed to Step E.

Step E

1. Turn ignition switch to **OFF** position.

2. Connect a voltmeter between F1 terminal of alternator and ground.

3. Turn ignition switch to **RUN** position.

4. Voltmeter should read within 1 volt of battery voltage. If voltage shown is within 1 volt of battery voltage, alternator is not functioning

properly and must be removed from vehicle and repaired.

5. If no voltage is shown, this indicates an open circuit and the wire from the F1 terminal to ignition switch must be repaired.

Test 4

CHECKING CODE 44

Step A

1. Turn the ignition switch **OFF**.

2. Disconnect the logic module (black connector on EFI, blue connector on turbocharged engines).

3. Connect an ohmmeter between cavity No. 20 of logic module (black on EFI, blue on turbocharged engines) connector and ground.

4. Ohmmeter should show resistance, amount of resistance should be 8–29K ohms. Correct resistance, replace logic module. If 0 resistance, perform Step B. Open circuit, perform Step C.

Step B

1. Ohmmeter connected between cavity No. 20 of logic module (black on EFI, blue on turbocharged engines) connector and ground.

2. Disconnect power module 12-way connector.

3. Ohmmeter should show an open circuit. Open circuit, replace power module. If 0 resistance, repair wire of cavity No. 20 and cavity No. 3 of power module 12-way connector.

Step C

1. Disconnect power module 12-way connector.

2. Connect an ohmmeter between pin 3 of power module 12-way and ground.

3. Ohmmeter should show resistance, amount of resistance should be between 8–29K ohms.

4. Correct resistance, repair wire in cavity No. 20 of logic module (black on EFI, blue on turbocharged engines) and cavity No. 3 of power module 12-way connector. Open circuit, replace power module.

ALTERNATOR OVERHAUL

Disassembly

1. Remove the dust cover mounting nut. Remove the dust cover.

2. Remove the brush holder assembly mounting screws. Remove the brush holder assembly.

3. Remove the stator to rectifier mounting screws. Remove the stator-to-rectifier assembly mounting screws. Remove the rectifier insulator. Remove the capacitor mounting screw. Remove the rectifier assembly.

4. Remove the through bolts. Care-

fully pry between the stator and the drive end shield, using a suitable tool and separate the end shields. The stator is laminated, do not burr the stator or the end shield.

5. Position the drive end of the alternator over the bosses of the holding fixture. Do not position the rotor plastic termination plate over the fixture boss or damage to the assembly will result.

6. Bolt the drive end of the assembly to shield fixture. Loosen the pulley mounting nut. Remove the pulley mounting nut. Remove the pulley washer.

7. Remove the poly-vee pulley. Remove the fan. Remove the front bearing spacer. Press the rotor assembly out of the drive end shield.

8. Remove the inner bearing spacer. Position the alternator bearing puller tool under the rear rotor bearing. Tighten the right puller bolt a 1/2 turn. Tighten the left puller bolt a 1/2 turn. Continue tightening the tool a 1/2 turn on each bolt until the rear rotor bearing is free. Remove the rear rotor bearing assembly from the rotor.

9. Position the rotor assembly in the holding fixture. Position the rear rotor bearing onto the rotor shaft.

10. Drive the rear rotor bearing onto the rotor until it bottoms. The rear rotor position is critical and must be installed using special tools C-4885 and C-4894.

11. Remove the front bearing retaining screws. Press the front bearing out of the drive end shield.

12. Carefully remove the stator from the rectifier end shield.

Inspection

ROTOR ASSEMBLY TEST

Check the outside circumference of slip-ring for dirtiness and roughness. Clean or polish with fine sandpaper, if required. A badly roughened slip-ring or a worn down slip-ring should be replaced.

Slip-rings are not serviced as a separate item. They are serviced with the rotor assembly.

ROTOR FIELD COILS FOR OPENS AND SHORTS TEST

To check for an open rotor field coil connect an ohmmeter between slip-rings. Ohmmeter readings should be between 1.5-2 ohms on rotor field coils at room ambient conditions. Resistance between 2.5-3.0 ohms would result from alternator rotor field coils that have been operated on vehicle at higher engine compartment temperatures. Readings about 3.5 ohms would indicate high resistance rotor field coils and further testing or replacement may be required.

To check for a shorted rotor field coil, connect an ohmmeter between both slip-rings. If the reading is below 1.5 ohms, the rotor field coil is shorted.

ROTOR FIELD COIL FOR GROUND TEST

To check for a grounded rotor field coil, connect an ohmmeter from each slip-ring to rotor shaft. Ohmmeter should be set for infinite reading when probes are apart and 0 when probes are shorted. The ohmmeter should read infinite. If the reading is 0 or low in value, rotor is grounded.

STATOR ASSEMBLY TEST

Stator Coil for Ground Test

1. Remove varnish from a spot on the stator frame.

2. Press an ohmmeter test probe firmly onto cleaned spot on frame. Be sure varnish has been removed from stator so that spot is bare.

3. Press the other ohmmeter test probe firmly to each of the 3 phase (stator) lead terminals 1 at a time. If ohmmeter reads 0 or low in value stator lead is grounded.

4. Replace stator if stator tested grounded.

Stator for Open or Short Circuit Test

The stator windings are delta wound. Therefore, they cannot be tested for opens or shorts with an ohmmeter. They can only be tested for these items with test equipment not common to automotive service test equipment. If stator is not grounded and all other electrical circuits and components of alternator test okay, it can be suspected that stator could possibly be open or shorted and must be replaced.

Rectifier Assemblies Test

When testing rectifiers with an ohmmeter, disconnect the 3 phase stator lead terminals from rectifier assembly. Pry stator lead terminals away from rectifier assembly.

Positive Rectifier Test

With an ohmmeter check for continuity between each positive (+) rectifier strap and positive (+) heat sink. Reverse test probes and retest. There should be continuity in one direction only. If there is continuity in both directions, rectifier is short circuited. If there is no continuity in either direction, rectifier is open. If rectifier is shorted or open, replace rectifier assembly.

Negative Rectifier Test

With an ohmmeter, check for continu-

ity between each negative (-) rectifier strap and negative (-) sink. Reverse test probes and retest. There should be continuity in one direction only. If there is continuity in both directions, rectifier is short circuited. If there is no continuity in either direction, rectifier is open. If rectifier is shorted or open, replace rectifier assembly. When installing a new rectifier assembly, apply 3 dabs (0.1 grams each) of heat sink compound to bottom of negative rectifier prior to mounting rectifier assembly to rectifier end shield.

Brushes and Brush Springs Continuity Test

When testing brushes and brush springs make sure that brushes move smoothly in brush holder. Sticking brushes require replacement of brush holder assembly.

Inner Brush Circuit Test

With an ohmmeter, touch a test probe to inner brush and another probe to field terminal. If there is no continuity, replace the brush assembly.

Outer Brush Circuit Test

With an ohmmeter, touch a test probe to outer brush and other probe to field terminal. If there is no continuity, replace brush assembly.

Cleaning Alternator Parts

Do not immerse stator field coil assembly, rotor assembly or rectifier assembly in cleaning solvent, as solvent will damage these parts.

Assembly

1. Be sure to repair or replace defective components as required.

2. To the front of the rotor, install the inner bearing spacer and press the drive end shield onto the rotor.

NOTE: The front drive end shield bearing must be replaced anytime the rotor or drive end shield is removed, for the front bearing is a press fit and may be damaged upon removal.

3. Position the drive end shield into a holding fixture so the fixture bosses do not contact the rotor plastic termination plate and tighten the holding bolt.

4. At the front of the drive end shield, install the pulley spacer (flat side up), the fan, the pulley, the washer and the pulley nut. Torque the pulley nut to 80-105 ft. lbs. (108-125 Nm).

5. Remove the drive end shield and rotor assembly from the holding fixture.

6. To assemble the rear end housing for the 40/90, perform the following procedures:

a. Apply joint compound to the rectifier end shield surface, under the rectifier mounting position.

b. Position the rectifier assembly to the rectifier drive end housing.

c. Install the rectifier insulator, the insulator mounting screws and torque the screws to 36-46 inch lbs. (4-6 Nm).

d. Install the capacitor terminal over the rectifier assembly battery terminal stud and torque the mounting screw to 36-48 inch lbs. (4-6 Nm).

e. Install the alternator battery terminal nut and torque to 30-50 inch lbs. (3-6 Nm).

f. Install the stator-to-rectifier screws and torque to 12-18 inch lbs. (1-2 Nm).

g. Slide the brushes into their cavity, Install the brush holder assembly and torque the screws to 12-18 inch lbs. (1-2 Nm).

h. Install the dust cover and torque the nut to 12-18 inch lbs. (1-2 Nm).

7. To assemble the rear end housing for the 50/120, perform the following procedures:

a. Apply joint compound to the rectifier end shield surface, under the rectifier mounting position.

b. Position the rectifier assemblies No. 1 and No. 2 to the rectifier drive end housing.

c. Install the rectifier insulators, the insulator mounting screws and

torque to 36-46 inch lbs. (4-6 Nm).

d. Install the capacitor terminal over the rectifier assembly No. 2 battery terminal stud and torque the mounting screw to 36-48 inch lbs. (4-6 Nm).

e. Install the alternator battery terminal nut and torque to 30-50 inch lbs. (3-6 Nm).

f. Position a jumper strap between the rectifier assemblies No. 1 and No. 2.; torque the nut to 36-48 inch lbs. (4-6 Nm) and the screw to 15-35 inch lbs. (2-4 Nm).

g. Position the 3 buss bars to the rectifier assemblies and torque the screws to 12-18 inch lbs. (1-2 Nm).

h. Slide the brushes into their cavity, Install the brush holder assembly and torque the screws to 12-18 inch lbs. (1-2 Nm).

i. Install the dust cover and torque the nut to 12-18 inch lbs. (1-2 Nm).

8. Assemble the rear end housing to the drive end shield and rotor assembly. Install the through bolts and torque to 48-72 inch lbs. (5-8 Nm).

9. Install the rear bearing oil seal.

Bosch 35/75, 40/90, 75 HS, 90 HS and 90 RS Amp Alternators

The alternators are alike, except, the 35/75 has 6 built-in silicon rectifiers

and the 40/90 has 12 (1986-87) or 8 (1988-90) built-in silicon rectifiers.

The voltage regulator is built into the power and logic modules for 1986-88 or the Single Module Engine Controller (SMEC) for 1989-90.

ON VEHICLE SERVICE

Charging Circuit Resistance Test

1. Be sure that the battery is fully charged.

2. Disconnect negative battery cable.

3. Disconnect BAT lead at alternator output terminal.

4. Connect a 0-150 ampere scale DC ammeter in series between alternator output BAT terminal and disconnected BAT terminal wire. Connect positive lead to alternator output BAT terminal and negative lead to disconnected alternator BAT lead.

5. Connect positive lead of a test voltmeter (range 0-18 volts minimum) to alternator BAT terminal. Connect negative lead of test voltmeter to battery positive post.

6. Remove air hose between power module (1986-88) or single module engine controller (1989-90) and air cleaner.

7. Connect an end of a jumper wire to ground and with other end, probe the green R3 lead wire of black 8-way connector (1986-88) or back of the alternator (1989-90). Do not connect blue J2 lead of 8-way wiring connector (1986-88) or back of the alternator (1989-90) to ground.

Bosch 40/90 amp alternator—charging resistance test—adjust engine speed and carbon pile to maintain 20 amps flowing in circuit. Voltmeter reading should not exceed 0.5 volts

17 CHARGING AND STARTING DOMESTIC

Bosch 90 RS amp alternator—charging system resistance test—adjust engine speed and carbon pile to maintain 20 amps, voltmeter reading should not exceed 0.5 volts

NOTE: On the 1986–88 vehicles, both R3 and J2 leads are green on alternator side of 8-way wiring connector. At dash end of 8-way connector, R3 is green and J2 is blue.

8. Connect an engine tachometer and reconnect negative battery cable.

9. Connect a variable carbon pile rheostat to the battery terminals. Be sure carbon pile is in **OPEN** or **OFF** position before connecting leads.

10. Start engine. Immediately after starting, reduce engine speed to idle.

11. Adjust engine speed and carbon pile to maintain 20 amperes flowing in circuit. Observe voltmeter reading. Voltmeter reading should not exceed 0.5 volts.

NOTE: If a higher voltage drop is indicated, inspect, clean and tighten all connections in charging circuit. A voltage drop test may be performed at each connection to locate connection with excessive resistance. If charging circuit resistance tested satisfactorily, reduce engine speed, turn **OFF** carbon pile and turn **OFF** ignition switch.

12. Disconnect negative battery cable.

13. Remove test ammeter, voltmeter, carbon pile and tachometer.

14. Remove jumper wire between 8-way black connector (1986–88) or the back of the alternator (1989–90) and ground.

15. Connect BAT lead to alternator output BAT terminal post.

16. Reconnect negative battery cable.

17. Reconnect hose between power module (1986–88) or single module engine controller (1989–90) and air cleaner.

Current Output Test

1. Be sure that the battery is fully charged.

2. Disconnect negative battery cable.

3. Disconnect the BAT lead wire at the alternator output terminal.

4. Connect a 0–150 ampere scale DC ammeter in series between alternator output BAT terminal and negative lead to disconnected BAT terminal.

5. Connect positive lead of a test voltmeter (range 0–18 volts minimum) to alternator output BAT terminal.

6. Connect negative lead of test voltmeter to a good ground.

7. Connect an engine tachometer and reconnect negative battery cable.

8. Connect a variable carbon pile rheostat tool between battery terminals. Be sure carbon pile is in **OPEN** or **OFF** position before connecting leads.

9. Remove air hose between power module (1986–88) or the single module engine controller (1989–90) and air cleaner.

10. Connect 1 end of a jumper wire to ground and with other end, probe the green R3 lead wire of black 8-way connector (1986–88) or at the back of the alternator (1989–90). Do not connect blue J2 lead of 8-way wiring connector (1986–88) or at the back of the alternator (1989–90) to ground.

NOTE: On the 1986–88 vehicles, both R3 and J2 leads are green on alternator side of 8-way wiring connector. At dash end of 8-way connector, R3 is green and J2 is blue.

11. Start engine. Immediately after starting reduce engine speed to idle.

12. Adjust carbon pile and engine speed in increments until a speed of 1250 rpm and voltmeter reading of 15 volts is obtained. Do not allow voltage meter to read above 16 volts.

13. The ammeter reading must be within the proper limits.

14. If reading is less than specified, alternator should be removed from vehicle and bench tested.

15. After current output is completed reduce engine speed, turn **OFF** carbon pile and turn **OFF** ignition switch.

16. Disconnect negative battery cable.

Bosch 40/90 amp alternator—current output test—adjust carbon pile and engine speed until a speed of 1250 rpm and voltmeter reading of 15 volts is obtained. The ammeter reading must be within proper limits

Bosch 90 RS amp alternator—current output test—adjust engine speed and carbon pile increments until an engine speed of 1250 rpm is reached, voltmeter reading should not exceed 15 volts

17. Remove test ammeter, voltmeter, tachometer and carbon pile.

18. Remove jumper wire between 8-way black connector (1986-88) or back of the alternator (1989-90) and ground.

19. Connect BAT lead to alternator output BAT terminal post.

20. Reconnect negative battery cable.

21. Reconnect hose between power module (1986-88) or the single module engine controller (1989-90) and air cleaner.

ALTERNATOR OVERHAUL

Disassembly

1. Remove the alternator from the vehicle. Position the unit in a suitable holding fixture.

2. Remove the pulley nut and lockwasher. Remove the alternator pulley.

3. Remove the pulley to fan spacer and pulley fan.

4. Remove the Woodruff key from the rotor shaft.

5. From the rear of the alternator disconnect the electrical terminal from the capacitor. Remove the capacitor retaining screw and the capacitor.

6. Remove the brush holder retaining screw and remove the brush holder from its mounting on the rear of the alternator.

7. Remove the alternator through bolts. Using a suitable tool pry between the stator and the drive end shield and carefully separate the assembly.

8. Press the rotor out of the drive end shield and remove the spacer. Remove the pulley fan spacer.

9. Remove the front alternator drive end bearing screws.

10. Remove the drive end shield bearing retainer and press out the drive end shield bearing.

11. Remove the front drive bearing from the front of the drive end shield.

12. To test the positive and negative rectifiers use tool C-3929-A or equivalent.

NOTE: Do not break the plastic cases of the rectifiers. These cases are for protection against corrosion. Be sure to always touch the test probe to the metal pin of the nearest rectifier.

13. Position the rear end shield and the stator assembly on an insulated surface. Connect the test lead clip to the alternator battery output terminal.

14. Plug in tool C-3829-A or equivalent. Touch the metal pin of each of the positive rectifiers with the test probe.

15. Reading for satisfactory rectifiers will be 1¾ amperes or more. Reading

should be approximately the same and meter needle must move in same direction for all 3 rectifiers.

16. When some rectifiers are good and 1 is shorted, the reading taken at good rectifiers will be low and the reading at shorted rectifiers will be zero. Disconnect stator lead to rectifiers reading zero and retest. Reading of good rectifiers will now be within satisfactory range.

17. When a rectifier is open it will read approximately 1 ampere and the good rectifiers will read within satisfactory range.

18. Touch the metal pin of each of the negative rectifiers with the test probe.

19. Test specifications are the same and the test results will be approximately same as for positive case rectifiers except that the meter will read on opposite side of scale.

NOTE: If a negative rectifier shows a shorted condition remove stator from rectifier assembly and retest. It is possible that a stator winding could be grounded to stator laminations or to an rectifier end shield, which would indicate a shorted negative rectifier.

20. Unsolder the stator to rectifier leads. Mark the stator coil frame, to aid in reinstallation of the stator. Remove the stator from the rectifier end shield assembly.

21. Remove the 3 rectifier assembly mounting screws. Remove the rectifier assembly.

22. Remove the inner battery (B+) stud insulator.

23. Remove the D+ stud insulator, stud nut, stud flatwasher and stud insulating washer.

24. Remove the rear bearing oil and dust seal. Check the rotor bearing surface for scoring.

25. Using puller C-4068 or equivalent, remove the rear rotor bearing.

26. Check outside circumference of slip-ring for dirtiness and roughness. Clean or polish with fine sandpaper, as required. A badly roughened slip-ring or a worn down slip-ring should be replaced.

27. To check for an open rotor field coil, connect an ohmmeter to slip-rings. Ohmmeter reading should be between 1.5-2 ohms on rotor coils at room ambient conditions. Resistance between 2.5-3.0 ohms would result from alternator rotors that have been operated on vehicle at higher engine compartment temperatures. Readings above 3.5 ohms would indicate high resistance rotor coils and further testing or replacement may be required.

28. To check for a shorted field coil connect an ohmmeter to slip-rings. If

reading is below 1.5 ohms field coil is shorted.

29. To check for a grounded rotor field coil connect an ohmmeter from each slip-ring to rotor shaft.

NOTE: Ohmmeter should be set for infinite reading when probes are apart and 0 when probes are touching. The ohmmeter should read infinite. If reading is 0 or higher, rotor is grounded.

30. Check for continuity between leads of stator coil. Press test probe firmly to each of 3 phase (stator) lead terminals separately. If there is no continuity, stator coil is defective. Replace stator assembly.

31. To test the stator for ground check for continuity between the stator coil leads and the stator coil frame. If there is no continuity the stator is grounded and must be replaced.

32. To test the inner and outer brush circuit, use an ohmmeter and touch 1 test probe to the inner brush and the other test probe to the brush terminal. If continuity does not exist replace the brush assembly. Repeat the same procedure for the outer brush.

Assembly

1. Be sure to check all parts for wear and replace the defective components as required.

2. Install the rear rotor bearing oil and dust seal.

3. Install the inner alternator battery B+ terminal insulator.

4. Position the rectifier assembly. Install the rectifier mounting screws, the insulator, the insulator washer, the insulator lockwasher and the insulator nut.

5. Position the stator assembly into the rectifier end shield. Align the scribe marks on the stator and the rectifier end shield.

6. Solder the stator leads to the rectifier assembly; be sure to use needle nose pliers as a heat sink.

7. Position and press the front bearing into the drive end shield. Install the bearing retainer and the pulley fan spacer onto the drive end shield.

8. Position the drive end shield and spacer over the rotor. Using a socket wrench, press the drive end shield onto the rotor.

9. Install the rectifier end shield and stator assembly into the drive end shield and rotor assembly. Install the through bolts and tighten.

10. Push the brushes into the brush holder and install the brush holder onto the alternator assembly.

11. Install the capacitor and terminal plug onto the alternator assembly.

12. Install the Woodruff key into the shaft and the fan over the shaft.

13. Install the drive pulley-to-fan spacer, the pulley, the lockwasher and the nut over the shaft. Secure the pulley and tighten the nut.

Mitsubishi 75 Amp and 90 Amp Alternator with Internal Regulator

This integrated circuit alternator has 15 built-in rectifiers, that convert A.C. current into D.C. current at the alternator battery terminal. The main components of the alternator are the rotor, stator, rectifiers, end shields, pulley, fan and capacitor. The electronic voltage regulator is very compact and is built into the rectifier end shield of the alternator.

ON VEHICLE SERVICE

Charging Circuit Resistance Test

1. With the ignition switch in the **OFF** position, disconnect the negative battery cable and the output wire from the alternator battery cable.
2. Using a 0-100 amp DC ammeter, connect it in series between the alter-

nator **BAT** terminal and the disconnected alternator output wire; connect the positive (+) wire to the alternator **BAT** terminal and the negative (-) wire to the disconnected alternator output wire.

3. Using a 0-18 volt voltmeter, connect its positive (+) lead to the disconnected alternator output wire and its negative (-) lead to the positive (+) battery post.

4. Install the tachometer to the engine.

5. Using a variable carbon pile rheostat, connect it between the battery posts; be sure the pile is in the **OPEN** or **OFF** position before connecting the leads.

6. Start the engine and allow it to idle.

7. Adjust the engine speed and the carbon pile to maintain 20 amps flowing in the circuit; the voltmeter should not exceed 0.5 volts.

8. If a higher voltage drop is indicated, clean and tighten the alternator output wire circuit connections.

9. If the resistance is satisfactory, reduce the engine speed, turn **OFF** the carbon pile and the ignition switch.

10. Remove the test equipment. Reconnect the alternator output wire and the negative battery cable.

Voltage Regulator Test

1. With the ignition switch in the **OFF** position, disconnect the positive cable from the battery and place a knife switch on the battery post and connect the cable to the knife switch.

2. Install the leads from an ammeter to the knife switch connectors and open the switch-to-battery current.

3. Connect the leads of a voltmeter between the **L** terminal of the alternator and a good ground.

4. The voltage reading should be zero volts. Should voltage be present, a defective alternator or wiring is indicated.

5. If no voltage is present, turn the ignition switch **ON** position. The voltage present should be lower than battery voltage, by about 1 volt or less. If the voltage reading is higher or at battery voltage, a defective alternator is indicated.

6. Connect a tachometer to the engine and close the knife switch, mounted on the battery post. Start the engine. Do not apply any starting current through the ammeter when starting the engine. The ammeter can be ruined.

7. After the engine is operating, open the knife switch and increase the

Mitsubishi 75 and 90 amp alternators with internal voltage regulator—charging system resistance test—adjust engine speed and carbon pile to maintain 20 amps, voltmeter reading should not exceed 0.5 volts

17 CHARGING AND STARTING DOMESTIC

Mitsubishi 75 and 90 amp alternators with external voltage regulator—voltage regulator test

VOLTAGE CHART	
Charging voltage	14.4 ± 0.3V at 20°C (68°F)
Temperature compensation gradient	−0.7 to .13V/10°C (50°F)

engine speed to approximately 2500 rpm and observe the ammeter reading.

8. If the ammeter reading is 10 amps or less, observe the voltage reading. This reading is the charging voltage.

NOTE: The charging voltage varies with the ambient temperature. It is necessary to measure the temperature of the air around the rear of the alternator and correct the charging voltage reading as required.

9. If the ammeter reading is more than 10 amps, continue to charge the battery until the reading falls under 10 amps or replace the battery with a fully charged one. An alternate method is to limit the charging circuit by connecting a ¼ ohm (25 watt) resistor in series with the battery.

10. Disconnect all test equipment, remove knife switch and reinstall the battery positive cable.

Current Output Test

The purpose of this test is to deter-

mine the capability of the alternator to deliver its rated current output.

1. With the ignition switch in the OFF position, disconnect the battery ground cable.

2. Disconnect the BAT lead wire from the terminal of the alternator.

3. Connect a 0–100 scaled ammeter in series, between the BAT terminal and the BAT lead wire.

4. Connect the positive lead of a voltmeter to the BAT terminal of the alternator and ground the negative lead.

5. Disconnect the green field wire (to voltage regulator) at the alternator.

6. Connect a tachometer to the engine and reconnect the negative battery cable.

7. Connect a carbon pile rheostat between the battery terminals. Be sure the carbon pile is in the OPEN or OFF position before connecting the leads.

8. Start the engine and operate at idle.

9. Adjust the carbon pile and accelerate the engine to the specified speed

and measure the output current. The current should be within specifications. Do not allow the voltage to increase over 16 volts.

10. The ammeter reading must be within the specified limits. If not the alternator should be removed and bench tested.

11. After the tests, disconnect the test equipment from the components.

ALTERNATOR OVERHAUL

Disassembly

1. Place the alternator in a vise or similar holding fixture, mark the body components and remove the through body bolts.

2. Pry between the stator and the drive end shield and carefully separate the drive end plate, the pulley and the rotor assembly from the stator and rectifier end shield assembly.

3. Carefully clamp the rotor and remove the pulley nut from the end of the shaft. Remove the pulley, the pulley fan, the pulley fan spacer and the alternator drive end shield from the rotor shaft.

4. The front bearing can be removed from the front drive housing by the removal of the dust seals, front and rear, the bearing retainer screws, the retainer, exposing the bearing so

Mitsubishi 75 and 90 amp alternators with external voltage regulator – current output test

75 AMP CURRENT OUTPUT CHART	
Output current (Hot or Cold) at Engine RPM	44-51A at 13.0 Volts and 750 RPM
	64-72A at 13.0 Volts and 1000 RPM
	74-78A at 13.0 Volts and 2000 RPM
90 AMP CURRENT OUTPUT CHART	
Output current (Hot or Cold) at Engine RPM	58-71A at 13.0 Volts and 750 RPM
	80-91A at 13.0 Volts and 1000 RPM
	95-102A at 13.0 Volts and 2000 RPM

that it can be tapped from the drive housing.

5. To remove the stator assembly. The 6 stator leads must be unsoldered from the rectifiers, as per the manufacturer's recommendation.

6. Remove the rectifiers from the stator end shield housing.

7. Remove the brush holder and regulator retaining screw.

8. Remove the Bat terminal retaining nut and remove the capacitor from the terminal.

9. Remove the regulator and rectifier assembly. Unsolder 1 rectifier-to-regulator assembly and remove the other rectifier assembly by sliding the battery stud out of the regulator.

10. Inspect the rotor bearing surface for scores and make the necessary off vehicle test on the electrical components.

Inspection

ROTOR ASSEMBLY

1. Check the outside circumference of the slip ring for dirtiness and roughness. Clean or polish with fine sandpaper, if required. A badly roughened slip ring or a slip ring worn down beyond the service limit should be replaced.

2. Check for continuity between the field coil and slip ring. If there is no continuity, the field coil is defective. Replace the rotor assembly.

3. Check for continuity between the slip ring and shaft (or core). If there is continuity, the coil or slip ring is grounded. Replace the rotor assembly.

STATOR ASSEMBLY

Check for continuity between the leads of the stator coil. If there is no

continuity the stator coil is defective. Replace the stator assembly.

RECTIFIER ASSEMBLY

Positive (+) Heat Sink Assembly

Check for continuity between the posi-

tive (+) heat sink and stator coil lead connection terminal with a continuity tester. If there is continuity in both directions the diode is short circuited. Replace the rectifier assembly.

Negative (–) Heat Sink Assembly

Check for continuity between the negative (–) heat sink and stator coil lead connection terminal. If there is continuity in both directions the diode is

short circuited. Replace the rectifier assembly.

RECTIFIER TRIO TEST

Using a circuit tester check the 3 diodes for continuity in both directions.

If there is either continuity or an open circuit in both directions the diode is defective. Replace the rectifier assembly.

Assembly

1. The assembly of the alternator is the reverse of the removal procedure. Certain steps must be performed as the alternator is assembled.

2. Install the seals in the front and in the rear of the front bearing with the angled lip away from the bearing.

3. Push the brushes into the brush holder and insert a wire to hold them in the raised position. Install the rotor and remove the holding wire.

Nippondenso 75, 90 and 120 Amp Alternators

The alternators are the same, except, the 75 amp alternator is equipped with 3 sets of diodes and the 90 amp and 120 amp alternators are equipped with 4 sets.

ALTERNATOR OVERHAUL

Disassembly

1. Remove the B+ insulator nut and insulator. Remove the rear cover nuts and cover.

2. Remove the brush holder screws and the brush holder.

3. Remove the field block screws and the block.

4. Remove the rectifier and stator terminal screws and the rectifier.

5. Remove the stator terminal rubber insulators and the end shield through stud nuts.

6. With the drive pulley facing downward, tap rectifier end shield upward and separate the 2 end shields.

7. Remove the drive pulley nut and the drive pulley.

Separating the end shields—

alternators

Testing the inner brush continuity—
Nippondenso 75, 90 and 120 amp
alternators

Testing the outer brush continuity—
Nippondenso 75, 90 and 120 amp
alternators

NOTE: Do not handle the slip rings of the rotor with the bare hands for oil or grease may restrict contact.

8. Pull the rotor assembly from the drive end shield.

9. Using a wheel puller, press the rectifier end shield bearing from the rotor shaft.

NOTE: When removing the bearing, be careful not to damage the slip rings.

10. From the drive end shield, remove the bearing retainer screws and the retainer.

11. Using a socket and a light hammer, place the drive end shield on a work surface and tap the bearing from the shield.

Inspection

BRUSH HOLDER TESTS

1. Make sure the brushes move smoothly and return fully to the stops when released; if not, replace the brush holder assembly.

2. Using an ohmmeter, test inner brush-to-field terminals continuity; 1 field terminal should be open and the other closed. If not, replace the brush holder.

3. Using an ohmmeter, test outer brush-to-field terminals continuity; a field terminal should be open and the other closed. If not, replace the brush holder.

Testing the field block R-3 terminal—
Nippondenso 75, 90 and 120 amp
alternators

Testing the field block J-2 terminal—
Nippondenso 75, 90 and 120 amp
alternators

Testing the field block R-3 to J-2
terminals—Nippondenso 75, 90 and
120 amp alternators

Testing the field block radio capacitor—
Nippondenso 75, 90 and 120 amp
alternators

FIELD BLOCK TESTS

1. Using an ohmmeter, test the outer brush terminal to R-3 field terminal for continuity; the circuit should be closed. If not, replace the field block.

2. Using an ohmmeter, test the inner brush terminal to J-2 field terminal for continuity; the circuit should be closed. If not, replace the field block.

3. Using an ohmmeter, test the R-3 field terminal to the J-2 terminal for continuity; the circuit should be open. If not, replace the field block.

4. Turn the field block over. Using an ohmmeter, test the radio

17 CHARGING AND STARTING DOMESTIC

suppression capacitor terminals for continuity; the circuit should be open. If not, replace the field block.

ROTOR TESTS

1. Check the field slip rings for excessive wear or roughness; fine emery cloth may be used to repair minor damage. If the rings are excessively damaged, replace the rotor.

2. Using an ohmmeter, test for continuity between the slip rings; the circuit should be closed. If not, replace the rotor.

3. Using an ohmmeter, test for continuity between the slip rings and the rotor shaft or core; the circuit should be open. If not, replace the rotor.

STATOR TESTS

1. Check the stator for signs damage—weak or broken leads, distorted frame or burned windings; if necessary, replace the stator.

NOTE: Using a scraping device, clean a portion of the stator frame to assure good electrical contact.

2. Using an ohmmeter, test for continuity between the stator leads and frame; the circuit should be open. If not, replace the stator.

3. Using an ohmmeter, test for continuity between the stator leads; the circuit should be closed. If not, replace the stator.

RECTIFIER TESTS

1. Inspect the rectifier assembly for poor solder joints, cracks, loose terminals or signs of overheating.

2. At each diode location, scrape a small area of the coating to assure good electrical contact while testing.

NOTE: Using an analog ohmmeter or a digital volt ohmmeter, perform the following tests.

3. Position the negative test probe on the stator terminal and the positive test probe on a negative diode; the resistance should be 7–11 ohms or 0.4–0.6 volts. Position the positive test probe on a positive diode; there should be no continuity. Perform this procedure on each terminal to diode set. If failure is detected, replace the rectifier.

4. Position the positive test probe on the stator terminal and the negative test probe on a positive diode; the resistance should be 7–11 ohms or 0.4–0.6 volts. Position the negative test probe on a negative diode; there should be no continuity. Perform this procedure on each terminal to diode set. If failure is detected, replace the rectifier.

Testing the diodes—Nippondenso 75, 90 and 120 amp alternators

Assembly

1. Using a socket, slightly smaller than the bearing, tap the bearing into the drive end shield.

2. Install the bearing retainer in the drive end shield.

3. Using a shop press, press the rectifier end shield bearing onto the rotor shaft.

NOTE: When installing the bearing, be careful not to damage the slip rings.

4. Install the rotor assembly into the drive end shield.

5. Install the drive pulley and nut.

6. Using solvent, clean the slip rings on the rotor shaft.

7. Align the rectifier end shield and assemble it to the drive end shield.

8. Install the through stud nuts and the stator terminal insulators.

9. Position the rectifier and install the screws.

10. Position the field block and install the screws.

11. Retract the brushes into the brush holder, slide the assembly over the commutator rings and install the screws.

12. Install the rear cover and nuts.

13. Align the B+ insulator guide boss into the rear cover hole and install the nut.

GENERAL MOTORS CORPORATION

SI Alternators

Delcotron alternators are available with different idle outputs and rated amp outputs.

All alternators incorporate a solid state voltage regulator which is mounted inside the alternator. The construction and operation of each alternator is basically the same. The Delcotron alternator consists of a forward and rear end frame assembly, a

rotor, a stator, brushes, slip-rings and diodes. The rotor is supported in the drive end frame by ball bearings and in the slip-ring end frame by roller bearings. The bearings do not require periodic lubrication.

There are 2 brushes which carry current through the slip-rings to the field coil. The field coil is mounted on the rotor. The stator windings are assembled on the inside of a laminated core that is part of the alternator frame. The rectifier bridge which is connected to the stator windings contains 6 diodes, 3 of which are negative and 3 of which are positive. The positive and negative diodes are moulded into the assembly. The rectifier bridge changes stator AC voltage into DC voltage which appears at the output BAT terminal.

The blocking action of the diodes prevents the battery from discharging, back through the alternator. The need for a cutout relay is eliminated because of this blocking action. The alternator field current is supplied through a diode trio, which is connected to the stator windings. A capacitor is mounted in the end frame to protect the rectifier bridge and the 6 diodes from high voltage and radio interference. Periodic alternator adjustment or maintenance is not required. The voltage regulator is preset and needs no adjustment.

ON VEHICLE SERVICE

Indicator Lamp Operation Test

1. Check the indicator lamp for normal operation. If the indicator lamp operates properly, refer to the undercharged battery test. If the indicator lamp does not operate properly, proceed accordingly.

2. Switch OFF, lamp ON. Unplug the connector from the generator No. 1 and No. 2 terminals. If the lamp stays ON, there is a short between these 2 leads. If the lamp goes out, replace the rectifier bridge.

3. Switch ON, lamp OFF, engine stopped. This condition can be caused by the defects listed above or by an open in the circuit. To determine where an open exists proceed as follows. Check for a blown fuse, or fusible link, a burned out bulb, defective bulb socket, or an open in No. 1 lead circuit between generator and ignition switch. If no defects have been found, proceed to undercharged battery test.

4. Switch ON, lamp ON, engine running. Check for a blown fuse, (where used), between indicator lamp and switch and also in A/C circuit.

Undercharged Battery Test

1. Be sure that the undercharged

Delcotron Alternator Availability Chart

Alternator Type	Rated Amp Output
10SI	37, 42, 63
12SI	56, 66, 78, 94
15SI	70, 85
17SI	—
27SI	65, 80, 100

Typical Delcotron charging system wiring schematic

battery condition has not been caused by accessories that have been left ON for an extended period of time.

2. Check the alternator belt for proper belt tension. Inspect the battery for physical defects replace as required.

3. Inspect the wiring for defects. Check all connections for proper contact and cleanliness, including the slip connectors at the generator and baulkhead connections.

4. With ignition switch ON and all wiring harness leads connected, connect a voltmeter from the generator BAT terminal to ground, from the generator No. 1 terminal to ground and from the generator No. 2 terminal to ground. A zero reading indicates an open circuit between voltmeter connection and battery.

5. Delcotron alternators have a built in feature, which prevents overcharge and accessory damage by preventing the alternator from turning on if there is an open circuit in the wiring harness connected to the No. 2 alternator terminal.

6. If Steps 1-5 check out okay, check the alternator as follows. Disconnect negative battery cable. Connect an ammeter or alternator tester in the circuit at the BAT terminal of the alternator. Reconnect negative battery cable.

7. Turn ON radio, windshield wipers, lights high beam and blower motor on high speed. Connect a carbon pile across the battery (or use alternator tester). Operate engine about 2000 rpm and adjust carbon pile as required, to obtain maximum current output. If ampere output is within 10 amperes of rated output as stamped on generator frame, alternator is not defective. Recheck Steps 1-5.

8. If ampere output is not within 10 percent of rated output, determine if test hole is accessible. Ground the field winding by inserting a suitable tool into the test hole. Tab is within $\frac{3}{4}$ in. of casting surface. Do not force suit-

Delcotron alternator—showing location of components—typical

Delcotron alternator—voltage test

able tool deeper than 1 in. into end frame to avoid damaging alternator.

9. Operate engine at moderate speed as required and adjust carbon pile as required to obtain maximum current output.

10. If output is within 10 amperes of rated output, check field winding, diode trio and rectifier bridge. Test regulator with an approved regulator tester.

11. If output is not within 10 amperes of rated output, check the field winding, diode trio, rectifier bridge and stator. If test hole is not accessible, disassemble alternator and repair as required.

Overcharged Battery Test

1. Check the condition of the battery before any testing is done.

2. If an obvious overcharging condition exists, remove the alternator from the vehicle and check the field wind-

Testing Delcotron alternator stator—use an ohmmeter to check for opens or grounds

Bench test hook-up for testing the Delcotron alternator

Delcotron alternator—if test hole is accessible, ground the field winding by inserting a suitable tool into the test hole (max. or 1 in.)

ings for grounds or shorts. If defective, replace the rotor. Test the regulator.

Alternator Diagnostic Tester (J-26290)

This special diagnostic tester is designed to determine if the alternator should be removed from the vehicle.

1. Install tester J-26290 according to manufacturers instructions.

2. With the engine **OFF** and all lights and accessories **OFF**, test the alternator as follows. Light flashes, go to Step 3. Light **ON**, indicates fault in tester which should be replaced. Light **OFF**, pull plug from generator. One flashing light, indicates that the alternator should be removed and the rectifier bridge replaced. Light **OFF**, indicates faulty tester or no voltage to tester. Check for 12 volts at No. 2 terminal of harness connector. Repair wiring or terminals if 12 volts is not available. Replace tester if 12 volts is available.

3. With the engine at fast idle and all accessories and lights **OFF**, test the alternator as follows. Light **OFF** indicates that the charging system good, do not remove alternator. Light **ON**

Delcotron alternator—exploded view showing assembly sequence of components

Delcotron alternator—voltage regulator test (on vehicle) voltage regulator setting should be 13.5–16.0 volts

indicates a component failure within the alternator. Remove alternator and check diode trio, rectifier bridge and stator. Light flashing indicates a problem within the alternator. Remove alternator and check regulator, rotor field coil, brushes and slip-rings.

Voltage Regulator Test

ALTERNATOR ON VEHICLE

1. Connect a battery charger and a voltmeter to the battery.

2. Turn the ignition **ON** and slowly increase the charge rate. The alternator light in the vehicle will dim at the voltage regulator setting. Voltage regulator setting should be 13.5–16.0 volts. This test works if the rotor setting is good, even if the stator rectifier bridge or diode trio is bad.

ALTERNATOR OFF VEHICLE

1. Remove the alternator from the vehicle.

2. Disassemble the alternator and remove the voltage regulator.

3. Connect a voltmeter and a fast charger to a 12 volt battery. Connect a test light to the regulator and observe the battery polarity.

4. The test light should light.

5. Turn **ON** the fast charger and slowly increase the charge rate. Observe the voltmeter, the light should go out at the voltage regulator setting. The voltage regulator setting specification is 13.5–16.0 volts.

ALTERNATOR OVERHAUL

Disassembly

1. Remove the alternator from the vehicle. Position the assembly in a suitable holding fixture.

2. Make scribe marks on the alternator case end frames to aid in reassembly.

3. Remove the through bolts that retain the assembly together. Separate the drive end frame assembly from the rectifier end frame assembly.

4. Remove the rectifier attaching nuts and the regulator attaching screws from the end frame assembly.

5. Separate the stator, diode trio and voltage regulator from the end frame assembly.

6. On the 10SI alternator, check the stator for opens using an ohmmeter. If high readings are obtained, replace the stator.

Delcotron alternator drive end bearing and related components

7. Check the stator for grounds using an ohmmeter. If readings are low, replace the stator.

8. Using an ohmmeter check the rotor for grounds. The ohmmeter reading should be very high. If not, replace the rotor.

9. Using an ohmmeter, check the rotor for opens. If the ohmmeter reading is not 2.4-3.5 ohms replace the rotor.

10. To check the diode trio connect the ohmmeter to the diode trio and then reverse the lead connections. The ohmmeter should read high and low if not replace the diode trio. Repeat the same test between the single connector and each of the other connectors.

11. Check rectifier bridge with ohmmeter connected from grounded heat sink to flat metal on terminal. Reverse leads. If both readings are the same replace rectifier bridge.

12. Repeat test between grounded heat sink and other 2 flat metal clips.

13. Repeat test between insulated heat sink and 3 flat metal clips.

14. Clean or replace the alternator brushes as required. Position the brushes in the brush holder and retain them in place using the brush retainer wire or equivalent.

15. To remove the rotor and drive end bearing, remove the shaft nut,

washer and pulley, fan and collar. Push the rotor from the housing.

16. Remove the retainer plate from inside the drive end frame. Push the bearing out. Clean or replace parts as required.

Inspection

ALTERNATOR BENCH TEST

1. Remove the alternator from the vehicle. Position the unit in a suitable test stand.

2. Connect the alternator in series, but leave the carbon pile disconnected.

NOTE: Ground polarity of the battery must be the same as the alternator. Be sure to use a fully charged battery and a 10 ohm resistor rated at 6 watts or more between the alternator No. 1 terminal and the battery.

3. Increase the alternator speed slowly and observe the voltage.

4. If the voltage is uncontrolled with speed and increases above 15.5 volts, test regulator with an approved regulator tester and check field winding. If voltage is below 15.5 volts, connect the carbon pile.

5. Operate the alternator at moderate speed as required and adjust the

carbon pile as required to obtain maximum current output.

6. If output is within 10 amperes of rated output as stamped on alternator frame, alternator is good. If output is not within 10 amperes of rated output, keep battery loaded with carbon pile and ground alternator field.

7. Operate alternator at moderate speed and adjust carbon pile as required to obtain maximum output. If output is within 10 amperes of rated output, test regulator with an approved regulator tester and check field winding.

8. If output is not within 10 amperes of rated output, check the field winding, diode trio, rectifier bridge and stator.

Assembly

1. Press against the outer bearing race to push the bearing in. On early production alternators it will be necessary to fill the bearing cavity with lu-

Delcotron alternator end frame—showing location of related components

Delcotron alternator rectifier end bearing installation

Testing Delcotron alternator rectifier bridge using an ohmmeter

Testing Delcotron alternator diode trio using an ohmmeter

bricant. Late production alternators use a sealed bearing and lubricant is not required for assembly.

2. Press rotor into end frame. Assemble collar, fan, pulley, washer and nut. Torque shaft nut 40-60 ft. lbs.

3. Push slip-ring end bearing out from outside toward inside of end frame.

4. On 10SI and 15SI, place flat plate over new bearing and press from outside toward inside until bearing is flush with end frame.

5. On 15SI alternators use the thin wall tube in the space between the grease cup and the housing to push the bearing in flush with the housing.

6. Assemble brush holder, regulator, resistor, diode trio, rectifier bridge and stator to slip-ring end frame.

7. Assemble end frames together with through bolts. Remove brush retainer wire.

GENERAL MOTORS CORPORATION

CS Alternators

Another type of charging system is the CS charging system. There are 2 sizes of alternator available, 130 and 144, denoting the OD in mm of the stator laminations. CS alternators use a new type regulator a diode trio is not used. A delta stator, rectifier bridge and rotor with slip-rings and brushes are electrically similar to earlier alternators. A regular pulley and fan is used and, on the 130, an internal fan cools

Cross-sectional view of the alternator drive end bearing assembly - Delcotron CS 130 alternator

the slip-ring end frame, rectifier bridge and regulator.

Unlike 3 wire alternators, the 130 and 144 may be used with only 2 connections, the battery positive and an L terminal to the charge indicator bulb. Use of P, F and S terminals is optional. The P terminal is connected to the stator and may be connected externally to a tachometer or other device. The F terminal is connected internally to field positive and may be used as a fault indicator. The S terminal may be connected externally to a voltage, such as battery voltage, to sense voltage to be controlled.

As on other charging systems, the charge indicator lights when the switch is closed and goes out when the engine is running. If the charge indicator is ON with the engine running, a charging system defect is indicated. For all kinds of defects, the indicator will glow at full brilliance, not half lit. Also, the charge indicator will be ON with the engine running if system voltage is too high or too low. The regulator voltage setting varies with temperature and limits system voltage by controlling rotor field current.

This regulator switches rotor field current ON and OFF at a fixed frequency of about 400 cycles per second. By varying the ON/OFF time, correct average field current for proper system voltage control is obtained. At high speeds, the ON time may be 10% and the OFF time 90%. At low speeds, with high electrical loads, ON/OFF time may be 90% and 10% respectively. No periodic maintenance on the generator is required.

Schematic of the Delcotron CS series charging system

Location of the components - CS 130 alternator

ON VEHICLE SERVICE

When operating normally, the indica-

TROUBLESHOOTING **GM DELCOTRON ALTERNATOR** **(WITH INTERNAL CONTROL REGULATOR)**

17 CHARGING AND STARTING DOMESTIC

tor lamp will illuminate when the ignition switch is turned **ON** and go out when the engine starts. If the lamp operates abnormally, or if an undercharged or overcharged battery condition occurs, the following procedure may be used to diagnose the charging system.

To diagnose the CS-130 and CS-144 charging systems, use the following procedure.

1. Visually check the belt and wiring.

2. For vehicles without charge indicator lamp, go to Step 5.

3. With switch **ON**, engine stopped, lamp should illuminate. If not, detach harness at generator and ground L terminal. If the lamp lights, repair or replace the generator. If the lamp does not light locate open circuit between grounding lead and ignition switch. Lamp may be open.

4. With switch **ON**, engine running at moderate speed, lamp should illuminate. If not, detach wiring harness at generator. If the lamp goes off, replace or repair generator. If the lamp stays on, check for grounded L terminal wire in harness.

5. Battery undercharged or overcharged. Detach wiring harness connector from generator. With switch **ON**, engine not running, connect voltmeter from ground to L terminal. Zero reading indicates open circuit between terminal and battery. Correct as required. Reconnect harness connector to generator, run engine at moderate speed. Measure voltage across battery. If above 16 volts, replace or repair generator.

6. Turn **ON** accessories, load battery with carbon pile to obtain maximum amperage. Maintain voltage at 13 volts or above. If within 15 amperes of rated output, generator is fine. If not within 15 amperes of rated output, repair or replace the generator.

ALTERNATOR OVERHAUL

Disassembly and Assembly

The alternator is serviced as an assembly only.

CS-144

1. Remove the alternator from the vehicle. Scribe marks on the end frames to facilitate assembly.

2. Remove the through bolts and separate the end frames.

3. Check the rotor for grounds using an ohmmeter. The reading should be infinite, if not, replace the rotor.

4. Check the rotor for shorts and opens. Replace the rotor as required.

5. Remove the attaching nuts and the stator from the end frame.

6. Check the stator for grounds us-

ing an ohmmeter. If the reading is low replace the stator.

7. Unsolder the connections, remove the retaining screws and connector from the end frame. Separate the regulator and the brush holder from the end frame.

8. Check the rectifier bridge using an ohmmeter. Replace as required. Check the heat sink, using an ohmmeter. Replace as required. Clean the brushes. Replace them as required.

9. To remove the rotor and drive end bearing, Hold the rotor using a hex wrench in the shaft end while removing the nut. Push the rotor from the housing. Remove the plate and push the bearing out.

10. Assembly is the reverse of the disassembly procedure. Repair or replace defective components as required.

CS-130

1. Remove the alternator from the vehicle. Scribe marks on the end frames to facilitate assembly. Remove the through bolts and separate the end frames.

2. Remove the cover rivets or pins. Remove the cover on the slip-ring end frame.

3. Unsolder the stator leads at the 3 terminals on the rectifier bridge. Avoid excessive heat, as damage to the assembly will occur. Remove the stator.

4. Drive out the 3 baffle pins. Remove the baffle from inside of the slip-ring end frame.

5. Check the rotor for grounds using an ohmmeter. The reading should be infinite, if not, replace the rotor. Check the rotor for shorts and opens, the ohmmeter should read 1.7-2.3 ohms. Replace the rotor as required.

6. Check the stator for grounds using an ohmmeter. If the reading is low replace the stator.

7. Remove the brush holder screw. Disconnect the terminal and remove the brush holder assembly. Check and replace the brushes, as required.

8. Unsolder and pry open the terminal between the regulator and the rectifier bridge. Remove the terminal and the retaining screws. Remove the regulator and the rectifier bridge from the end frame.

9. To check the rectifier bridge, connect the proper (analog reading) ohmmeter, using the low scale, to a terminal and the heat sink, record the reading. Reverse the test leads and record the reading. If both readings are the same replace the rectifier bridge. Check the other diodes in the same manner.

10. To remove the rotor and drive end bearing, Hold the rotor using a

hex wrench in the shaft end while removing the nut. Push the rotor from the housing. Remove the plate and push the bearing out.

11. Assembly is the reverse of the disassembly procedure. Repair or replace defective components as required.

Inspection

ALTERNATOR BENCH TEST

1. Make the proper connections but leave the carbon pile disconnected. The ground polarity of generator and battery must be the same. The battery must be fully charged. Use a 30-500 ohm resistor between battery and L terminal.

2. Slowly increase generator speed and observe voltage.

3. If the voltage is uncontrolled and increases above 16.0 volts, the rotor field is shorted, the regulator is defective or both. A shorted rotor field coil can cause the regulator to become defective. The battery must be fully charged when making this test.

4. If voltage is below 16.0 volts, increase speed and adjust carbon pile to obtain maximum amperage output. Maintain voltage above 13.0 volts.

5. If output is within 15 amperes of rated output, generator is good.

6. If output is not within 15 amperes of rated output, generator is faulty and requires repair or replacement.

General Motors Alternator with Rear Vacuum Pump

The Delcotron alternator with rear vacuum pump, manufactured by Mitsubishi, is basically the same as the other Delcotron alternators, with the exception of a rear vacuum pump which is mounted on the back of the alternator assembly. The vacuum pump is driven by the alternator shaft and is used to provide vacuum to various control systems throughout the vehicle.

ALTERNATOR OVERHAUL

Disassembly and Assembly

1. Remove the alternator from the vehicle. Position the unit in a suitable holding fixture.

2. Remove the vacuum pump retaining bolts. Remove the vacuum pump from the rear of the alternator while holding the center plate.

3. Remove the brush cover retaining bolts and brushes. Wrap the pump

drive shaft spline with tape in order to protect the rear seal from damage.

4. Inspect the vacuum pump for wear and damage, replace defective components as required. Measure the length of the vanes, replace if not within specification (0.511–0.531 in.) Measure the inside diameter of the housing and replace if not within specification (2.440–2.441 in.).

5. Examine the check valve for damage. Apply light pressure to the valve and make sure the valve operates properly. Replace as required.

6. Check the inner face of the rear cover on the vacuum pump for oil leakage. Check the inner face of the oil seal for wear and damage. Replace the oil seal in the rear end housing of the vacuum pump as required.

7. Remove the alternator through bolts which hold the unit together. Matchmark the assembly to aid in reassembly. Separate the front end housing from the stator and rear end housing.

8. Remove the pulley nut, fan and front end housing from the rotor.

9. Remove the front bearing retainer screws. Remove the front bearing retainer and the bearing from the front end housing.

10. Remove the bolt and nuts retaining the stator, diodes and brush holder to the rear end housing. Note the position of the insulating washers for reassembly.

11. Separate the rear end housing from the stator and diode assembly.

12. Remove the diodes from the stator by melting the solder from the terminals. Be sure to protect the diodes while melting the solder.

13. Remove the solder from the voltage regulator holder plate terminal. Remove the voltage regulator.

14. Check the slip-ring surfaces of the rotor for wear and damage, repair or replace as required.

15. Measure the outside diameter of the rotor slip-rings. If ring diameter is not 1.18–1.24 in., replace the rotor.

16. Connect the ohmmeter test leads to each slip-ring. Resistance should be 4.2 ohms at 68°F. If continuity does not exist the coil is open and the rotor must be replaced.

17. Connect the ohmmeter to either slip-ring and the rotor core. If continuity exists the coil is grounded and the rotor must be replaced.

18. Check the front and rear rotor bearings for wear and damage. Replace defective parts as required.

19. Check for continuity across the stator coils. If continuity does not exist in any 1 stator coil replace the stator assembly.

20. Check for continuity across any of the stator coils and the stator core.

If continuity exists, 1 of the stator coils is grounded and the stator must be replaced.

21. Coil resistance should be 0.05 ohms at 68°F and should be measured from the coil lead to terminal N.

22. Inspect the alternator brush assembly for wear and damage. Replace defective components as required.

23. Check for continuity of positive diodes between each stator coil terminal and the battery terminal of rectifier assembly. Reverse the ohmmeter leads and recheck for continuity.

24. If continuity exists in both polarity directions or does not exist in both directions diode is defective and must be replaced.

25. Check for continuity of negative diodes between each stator lead and E terminal or rectifier assembly. Reverse ohmmeter leads and recheck for continuity. Continuity should exist in 1 direction only.

26. Assemble a test circuit using the following components: One 10 ohm 3 watt resistor (R_1) one 0–300 ohm 3 watt variable resistor (R_2), two 12 volt batteries (BAT_1 and BAT_2) and one 0–30 volt DC voltmeter.

27. Adjust variable resistor (R_2) until voltage at V_4 reads the same as voltage at V_3 (this should be all the way to 1 end of travel or 0 ohms).

28. Connect the test circuit to the integrated circuit regulator terminals. Measure voltage at V_1 and V_2 . Voltage should measure 10–13 volts at V_1 and 0–2 volts at V_2 .

29. Disconnect terminal S from circuit and measure voltage at V_3 . Voltage at V_3 should be 20–26 volts. Reconnect terminal S.

30. Measure voltage at V_4 while increasing resistance at R_2 from 0 ohms. V_4 voltmeter reading should increase from 2 volts to 10–13 volts. Stop increasing R_2 when voltage reaches 10–13 volts.

31. If increase at V_4 is interrupted at any point up to 10–13 volts, while increasing resistance at R_2 , regulator is defective.

32. Measure voltage at V_4 with R_2 at same setting as previous step that produced 10–13 volt reading at V_2 . If V_4 not within 14–14.6 volts, regulator is defective.

33. Disconnect wire at terminal S. Connect it to terminal B. Repeat Step 30. If V_2 does not vary or V_4 is not within 14.5–16.6 volts, regulator is defective.

34. To assemble the alternator reverse the disassembly procedure. Be sure to check all parts for wear and damage. Replace defective components as required.

35. Insert the brushes into the brush holder and insert a wire to retain them

in place. Install the rotor and remove the retaining wire.

FORD MOTOR COMPANY

Rear Terminal Alternator

The Ford charging system is a negative ground system. It includes an alternator, electronic regulator, a charge indicator or an ammeter and a storage battery.

CHARGING SYSTEM OPERATION

NOTE: If the current indicator is to give an accurate reading, the battery cables must be of the same gauge and length as the original equipment.

1. With the engine running and all electrical systems turned **OFF**, position a current indicator over the positive battery cable.

2. If a charge of about 5 amps is recorded, the charging system is working. If a draw of about 5 amps is recorded, the system is not working. The needle moves toward the battery when a charge condition is indicated and away from the battery when a draw condition is indicated. If a draw is indicated continue to the next testing procedure. If an overcharge of 10–15 amps is indicated check for a faulty regulator or a bad ground at the regulator or the alternator.

Ignition Switch to Regulator Circuit Test

1. Disconnect the regulator wiring harness from the regulator.

2. Turn **ON** the key. Using a test light or voltmeter check for voltage between the I wire and ground. Check for voltage between the A wire and ground. If voltage is present at this part of the system the circuit is OK. If there is no voltage at the I wire check for a burned out charge indicator bulb, a burned-out resistor, or a break or short in the wiring. If there is no voltage present at the A wire check for a faulty connection at the starter relay or a break or short in the wire.

Isolation Test

This test determines whether the regulator or the alternator is faulty after

17 CHARGING AND STARTING DOMESTIC

Ford alternator with external regulator—rear terminal alternator charging system schematic with indicator light—typical side terminal alternator

Ford alternator with external regulator—rear terminal alternator charging system schematic with ammeter—typical side terminal alternator

the rest of the circuit is found to be in good working order.

1. Disconnect the regulator wiring harness from the regulator.

2. Connect a jumper wire from the A wire to the F wire in the wiring harness plug.

3. Connect a voltmeter to the battery. The positive voltmeter lead goes to the positive terminal and the negative lead to the negative terminal. Record the reading on the voltmeter.

4. Turn **OFF** all of the electrical systems and start the engine. Do not race the engine.

5. Gradually increase engine speed 1500–2000 rpm. The voltmeter reading should increase above the previously recorded battery voltage reading by at least 1–2 volts. If there is no increase the alternator is not working correctly. If there is an increase the voltage regulator needs to be replaced.

ALTERNATOR OVERHAUL

Disassembly

1. Matchmark both end housings for assembly.

2. Remove the housing through bolts.

3. Separate the front housing and rotor from the stator and rear housing.

4. Remove the nuts from the rectifier to rear housing mounting studs and remove rear housing.

5. Remove the brush holder mounting screws and the holder, brushes, springs, insulator and terminal.

6. If replacement is necessary press the bearing from the rear end housing while supporting the housing on the inner boss.

7. If rectifiers are to be replaced carefully unsolder the leads from the terminals. Use only a 100 watt soldering iron. Leave the soldering iron in contact with the diode terminals only long enough to remove the wires. Use pliers as temporary heat sinks in order to protect the diodes.

8. There are various types of rectifi-

Testing diodes with stator wires connected—Ford alternator with external regulator

Testing diodes—Ford alternator with external regulator

Using a jumper wire at the regulator plug to test the alternator for normal output amps and for field circuit wiring continuity—Ford alternator with external regulator

er assembly circuit boards installed in production. One type has the circuit board spaced away from the diode plates and the diodes are exposed. Another type consists of a single circuit board with integral diodes; and still another has integral diodes with an additional booster diode plate containing 2 diodes.

9. This last type is used only on the 8 diode (61 amp) alternator. To disassemble use the following procedures. Exposed diodes remove the screws from the rectifier by rotating bolt heads $\frac{1}{4}$ turn clockwise to unlock and unscrewing. Integral diodes, press out the stator terminal screw, making sure not to twist it while doing this. Do not remove grounded screw. Booster diodes, press out the stator terminal screw about $\frac{1}{4}$ in., remove the nut from the end of the screw and lift screw from circuit board. Be sure not to twist it as it comes out.

10. Remove the drive pulley and fan. On alternator pulleys with threaded holes in the outer end of the pulley use a standard puller for removal.

11. Remove the front bearing retainer screws and the front housing. If the bearing is to be replaced press it from the housing.

Brush Replacement

1. Remove the brush holder and cover assembly from the rear housing.

2. Remove the terminal bolts from the brush holder and cover assembly. Remove the brush assemblies.

3. Position the new brush terminals on the terminal bolts and assemble the terminals, bolts, brush holder washers and nuts. The insulating washer mounts under the FLD terminal nut. The entire brush and cover assembly also is available for service.

4. Depress the brush springs in the brush holder cavities and insert the brushes on top of the springs. Hold the brushes in position by inserting a stiff wire in the brush holder as shown. Position the brush leads as shown.

5. Install the brush holder and cover assembly into the rear housing. Remove the brush retracting wire and put a dab of silicone cement over the hole.

Inspection

1. The rotor, stator, diode rectifier assemblies and bearings are not to be cleaned with solvent. These parts are to be wiped off with a clean cloth. Cleaning solvent may cause damage to the electrical parts or contaminate the bearing internal lubricant. Wash all other parts in solvent and dry them.

2. Rotate the front bearing on the driveshaft. Check for any scraping noise, looseness or roughness that in-

17 CHARGING AND STARTING DOMESTIC

Exploded view of the rear terminal alternator with an external voltage regulator

View of stator and rectifier assemblies and terminals—Ford alternator with external regulator

Rectifier assemblies and related components—Ford alternator with external regulator

FORD AUTOLITE/MOTORCRAFT ALTERNATOR (WITH EXTERNAL REGULATOR)

dicates that the bearing is excessively worn. As the bearing is being rotated look for excessive lubricant leakage. If any of these conditions exist replace the bearing. Check rear bearing and rotor shaft.

3. Place the rear end housing on the slip-ring end of the shaft and rotate the bearing on the shaft. Make a similar check for noise, looseness or roughness. Inspect the rollers and cage for damage. Replace the bearing if these conditions exist or if the lubricant is missing or contaminated.

4. Check both the front and rear housings for cracks.

5. Check all wire leads on both the stator and rotor assemblies for loose soldered connections and for burned insulation. Solder all poor connections. Replace parts that show burned insulation.

6. Check the slip-rings for damaged insulation and runout. If the slip-rings are more than 0.005 in. out of round, take a light cut (minimum diameter limit 1.220 in.) from the face of the rings to true them. If the slip-rings are badly damaged the entire rotor will have to be replaced as an assembly.

7. Replace any parts that are burned or cracked. Replace brushes that are worn to less than $\frac{5}{16}$ in. in length. Replace the brush spring if it has less than 7-12 oz. tension.

FIELD CURRENT DRAW TEST

1. Remove the alternator from the vehicle. Connect a test ammeter between the alternator frame and the positive post of a 12 volt test battery.

2. Connect a jumper wire between the negative test battery post and the alternator field terminal.

3. Observe the ammeter. Little or no current flow indicates high brush resistance, open field windings, or high winding resistance. Current in excess of specifications (approximately 2.9 amps for most models) indicates shorted or grounded field windings, or brush leads touching.

NOTE: The alternator, may produce current output at low engine speeds, but ceases to produce current at higher speeds. This can be caused by centrifugal force expanding the rotor windings to the point where they short to ground. Place in a test stand and check field current draw while spinning alternator.

DIODE TESTS

Disassemble the alternator. Disconnect diode assembly from stator and make tests. To test one set of diodes contact 1 ohmmeter probe to the diode

plate and contact each of the 3 stator lead terminals with the other probe. Reverse the probes and repeat the test. All 6 tests (eight for 61 amp 8-diode models) should show a reading of about 60 ohms in one direction and infinite ohms in the other. If 2 high readings or 2 low readings are obtained after reversing probes, the diode is faulty and must be replaced.

STATOR TESTS

Disassemble the stator from the alternator assembly and rectifiers. Connect test ohmmeter probes between each pair of stator leads. If the ohmmeter does not indicate equally between each pair of leads the stator coil is open and must be replaced.

Connect test ohmmeter probes between one of the stator leads and the stator core. The ohmmeter should not show any reading. If it does show continuity the stator winding is grounded and must be replaced.

Assembly

1. Press the front bearing into the front housing boss by putting pressure on outer race only. Install bearing retainer.

2. If the stop ring on the driveshaft was damaged install a new stop ring. Push the new ring onto the shaft and into the groove.

3. Position the front bearing spacer on the driveshaft against the stop ring.

4. Place the front housing over the shaft with the bearing positioned in the front housing cavity.

5. Install fan spacer, fan, pulley, lockwasher and retaining nut and tighten nut 60-100 ft. lbs. while holding the driveshaft with an Allen key.

6. If rear bearing was removed, press a new one into rear housing.

7. Assemble brushes, springs, terminal and insulator in the brush holder, retract the brushes and insert a short length of $\frac{1}{8}$ in. rod or stiff wire through the hole in the holder to hold the brushes in the retracted position.

8. Position the brush holder assembly in the rear housing and install mounting screws. Position brush leads to prevent shorting.

9. Wrap the 3 stator winding leads around the circuit board terminals and solder them using only rosin core solder and a solder iron. Position the stator neutral lead eyelet on the stator terminal screw and install the screw in the rectifier assembly.

10. Exposed diodes, insert the special screws through the wire lug, dished washers and circuit board. Turn $\frac{1}{4}$ turn counterclockwise to lock in place. Integral diodes, insert the screws straight through the holes.

NOTE: The dished washers are to be used on the molded circuit boards only. Using these washers on a fiber board will result in a serious short circuit, as only a flat insulating washer between the stator terminal and the board is used on fiber circuit boards.

11. Booster diodes, position the stator wire terminal on the stator terminal screw, then position screw on rectifier. Position square insulator over the screw and into the square hole in the rectifier, rotate terminal screw until it locks, then press it in fingertight. Position the stator wire, then press the terminal screw into the rectifier and insulator with a vise.

12. Place the radio noise suppression condenser on the rectifier terminals. With molded circuit board and install the STA and BAT terminal insulators. With fiber circuit board place the square stator terminal insulator in the square hole in the rectifier assembly, then position BAT terminal insulator.

13. Position the stator and rectifier assembly in the rear housing, making sure that all terminal insulators are seated properly in the recesses. Position STA, BAT and FLD insulators on terminal bolts and install the nuts.

14. Clean the rear bearing surface of the rotor shaft with a rag and then position rear housing and stator assembly over rotor. Align matchmarks made during disassembly and install the through bolts. Remove brush retracting wire and place a dab of silicone sealer over the hole.

Ford Alternator with Internal Regulator

The Ford alternator with internal regulator is manufactured by Motorcraft, which is a division of the Ford Motor Company. The field current is supplied from the alternator regulator which is mounted on the rear of the alternator, to the rotating field of the alternator through 2 brushes and 2 slip-rings.

The alternator produces power in the form of alternating current. The alternating current is rectified to direct current by 6 diodes. The alternator regulator automatically adjusts the alternator field current to maintain the alternator output voltage within prescribed limits to correctly charge the battery. The alternator is self current limiting.

Schematic of the charging system—Ford alternator with internal regulator

The regulator voltage control circuit is turned on when the ignition switch is **ON** and voltage is applied to the regulator I terminal through a resistor in the I circuit. When the ignition switch is **OFF** the control circuit is turned off and no field current flows to the alternator.

On warning lamp equipped vehicles, the warning lamp is connected across the terminals of a 500 ohm resistor at the instrument cluster. Current passes through the warning lamp when the ignition switch is in the **RUN** position and there is no voltage at terminal S. When voltage at S rises to a preset value the regulator switching circuits stop the flow of current into terminal I and the lamp turns off.

System voltage is sensed and alternator field current is drawn through terminal A. The regulator switching circuits will turn the warning lamp on, indicating a system fault, if terminal A voltage is excessively high or low, or if the terminal S voltage signal is abnormal. A fusible link is included in the charging system wiring on all models. The fusible link is used to prevent damage to the wiring harness and alternator if the wiring harness should become grounded, or if a booster battery is connected to the charging system with the wrong polarity.

ON VEHICLE SERVICE

NOTE: The following diagnostic tests are made with the alternator installed in the vehicle. Be

sure that the battery is fully charged before any testing is done.

Battery Voltage Test

1. Connect a voltmeter to the positive and negative battery terminals.
2. Record the battery voltage. If battery voltage is not within specification, correct as required.

Load Test

1. Be sure that the battery is fully charged before performing this test.
2. Connect the tachometer to the engine.
3. Start the engine. Turn the heater/air condition switch to the **HIGH** blower position. Turn **ON** the headlights with the high beams. Increase engine speed to 2000 rpm.
4. Voltmeter should indicate a minimum of a 0.5 volt increase over battery voltage.
5. If the system is working the above readings will be obtained. Be sure not to ground the A terminal of the voltage regulator.

No Load Test

1. Be sure that the battery is fully charged before performing this test.
2. Connect a tachometer to the engine. Start the engine and increase the engine speed to 1500 rpm with no electrical load.
3. The voltmeter reading should be taken when the voltmeter needle stops moving. The voltmeter reading should

be 1–2 volts above the voltage of the battery.

4. If the voltage increased properly proceed with another test.

High Voltage Test

1. Be sure that the battery is fully charged before performing this test.
2. Turn the ignition switch to the **ON** position. Connect the voltmeter negative lead to the rear of the alternator housing.
3. Connect voltmeter positive lead to alternator output terminal and record voltage. Connect voltmeter positive lead to the A terminal of regulator. Compare voltage difference recorded at alternator output terminal.
4. If voltage difference is greater than 0.5 volt, repair or replace wiring circuit to A terminal.
5. If high voltage condition still exists check ground connections at regulator to alternator, alternator to engine, firewall to engine and engine to battery.
6. If high voltage condition still exists connect voltmeter negative lead to rear of alternator housing. With ignition to **OFF** position connect voltmeter positive lead to A terminal of regulator and record reading. Connect voltmeter positive lead to F terminal of regulator.
7. Check if different voltage is present at A and F terminals. Different voltage readings indicate a defective regulator, grounded brush leads or grounded rotor coil.
8. If same voltage is present at both

17 CHARGING AND STARTING DOMESTIC

terminals and circuits tested in previous steps are good replace the regulator.

Low Voltage Test

1. Be sure that the battery is fully charged before performing this test.

2. Disconnect the wiring plug from the voltage regulator and install the ohmmeter between terminals A and F.

3. The ohmmeter reading should indicate more than 2.2 ohms. If the reading is less than 2.2 ohms, replace the voltage regulator and check the alternator for a shorted rotor or open field circuit. Repeat the load test. Do not replace the voltage regulator before a shorted rotor coil or field circuit has been determined not to be the problem. If not, damage to the new regulator could occur.

4. If the field circuit is okay, more than 2.2 ohms, reconnect the voltage regulator wiring plug and connect the voltmeter negative lead to the rear of the alternator. Connect the positive lead of the voltmeter to terminal A of the voltage regulator. Battery voltage should be present, if so go on. If not, repair wiring in circuit A.

5. With the ignition switch in the OFF position connect the positive lead of the voltmeter to the F terminal of the voltage regulator.

6. If battery voltage is present, go on. If not, replace the voltage regulator. Repeat the load test.

7. Turn the ignition switch to the ON position. The voltmeter should indicate 1.5 volts or less. If the reading is more than 1.5 volts, perform the regulator I circuit test. Repair the voltage regulator as required. Repeat the load test.

8. If the voltmeter reading is 1.5 volts or less, disconnect the alternator wiring plug and connect a 12 gauge jumper wire between the alternator plug terminal and the wiring harness connector.

9. Connect the positive lead of the voltmeter to 1 of the B terminals. Repeat the load test.

10. If the reading is 0.5 volt above battery voltage, repair the wiring harness from the alternator to the starter relay.

11. If the voltmeter reading is less than 0.5 volt above battery voltage, connect a jumper wire from the rear of the alternator housing to terminal F of the voltage regulator.

12. Repeat the load test. If the voltmeter reading is more than 0.5 volt, replace the voltage regulator. If the reading is less than 0.5 volt, repair the alternator.

Voltage Regulator Circuit I Test

1. Disconnect the voltage regulator wiring plug harness.

2. Connect the voltmeter negative lead to the battery ground. Connect the voltmeter positive lead to the harness side of terminal I.

3. With the ignition switch in the OFF position, voltage should not be present. If voltage is present repair the circuit as necessary.

4. With the ignition switch in the ON position, battery voltage should be present. If voltage is not present, check the wiring for an open or grounded circuit. Repair as required.

5. If the voltage readings are within specification, check the resistance of the I circuit resistor. If the vehicle is equipped with an indicator light the resistance is 500 ohms. If the vehicle is equipped with a gauge, the resistance is 300 ohms. If the specification obtained is not within plus or minus 50 ohms, replace the resistor. Repeat the load test.

6. Disconnect the voltage regulator wiring plug and remove the indicator light bulb, if equipped, before performing this test.

Field Circuit Drain Test

1. Connect the negative lead of the voltmeter to the rear of the alternator housing. Turn the ignition switch to the OFF position. Connect the positive lead of the voltmeter to the F terminal of the voltage regulator.

2. Battery voltage should be present. If no voltage is present, proceed.

3. If voltage is less than battery voltage, check I circuit. Disconnect regulator wiring harness. Connect voltmeter positive lead to S terminal of wiring plug. If voltage is present, proceed to Step 4. If no voltage is present replace regulator.

4. Disconnect wiring plug from alternator. Check S terminal for voltage. If no voltage is present, replace alternator rectifier assembly. If voltage is still present, replace or repair wiring

between alternator and regulator plugs.

ALTERNATOR OVERHAUL

Disassembly and Assembly

1. Remove the alternator from the vehicle. Position the unit in a suitable holding fixture.

2. Remove the voltage regulator and the brush holder from the rear of the alternator assembly.

3. Remove the brush holder-to-voltage regulator screws and separate the components.

4. Matchmark the alternator end housings and stator frame to aid in installation.

5. Remove the alternator through bolts. Separate the front housing and the rotor assembly from the stator and the rear housing.

6. Unsolder the 3 stator leads from the rectifier assembly. Be careful that the rectifiers are not in contact with the solder iron, overheating them will cause damage.

7. Remove the rectifier assembly from the rear of the alternator housing. Press the rear alternator housing bearing from the rear housing.

8. From the front housing of the alternator remove the drive pulley nut from the rotor shaft.

9. Remove the lockwasher, drive pulley, fan and fan spacer from the rotor shaft.

10. Remove the rotor from the front housing. Remove the front bearing spacer from the rotor shaft. Do not remove the rotor stop ring unless it must be replaced.

11. Remove the front housing bearing retainer and bearing.

12. Assembly of the alternator is the reverse of the disassembly procedure. Be sure to clean and check all parts for wear and defects. Repair or replace defective components as required.

Ford alternator with internal regulator rear housing and related components.

Exploded view of the Ford alternator with internal regulator

View of the voltage regulator and brush holder—Ford alternator with internal regulator

Ford alternator with external regulator

Stator coil open test, using an ohmmeter. If meter does not respond, an open is present and the stator should be replaced—Ford alternator with internal regulator

Inspection

NOTE: In performing the following tests, digital meters cannot be used.

STATOR GROUND TEST

1. Using an ohmmeter connect 1 test lead to the B terminal and the other test lead to the S terminal.

2. Reverse the test leads and repeat the test. The ohmmeter should read about 6.5 ohms in 1 direction and infinity when the test probes are reversed.

3. A reading in both directions indicates a faulty positive diode or a shorted radio suppression capacitor.

4. Perform the same test using the

S terminal and the alternator rear housing.

5. Readings in both directions indicate a faulty negative diode, grounded stator winding, grounded stator terminal or a shorted radio suppression capacitor.

6. If the ohmmeter needle does not move in 1 direction, or high resistance in the other direction exists, there is

17 CHARGING AND STARTING DOMESTIC

an open circuit in the rectifier assembly. Correct the problem as required.

FIELD OPEN OR SHORT CIRCUIT TEST

1. Using an ohmmeter connect 1 test lead to terminal A on the voltage regulator. Connect the other test lead to terminal F of the voltage regulator. Spin the alternator pulley. Reverse the ohmmeter connections and repeat the test.

2. In one test the ohmmeter should read between 2.2–100 ohms. The reading may fluctuate while the pulley is spinning.

3. In the other test the ohmmeter should read between 2.2–9 ohms.

4. An infinite reading in one test and a 9 ohm reading in the other test indicates an open brush lead, worn or stuck brushes, faulty rotor assembly or loose voltage regulator to brush holder retaining screws.

5. A reading of less than 2.2 ohms in both tests indicates a shorted rotor or a faulty voltage regulator.

6. A reading greater than 9 ohms in both tests indicates a defective voltage regulator or a loose F terminal screw.

7. Connect 1 ohmmeter test lead to the rear of the alternator. Connect the other test lead to terminal A of the voltage regulator and then to terminal F of the voltage regulator. The ohmmeter should read infinity at both points.

8. A test reading of less than infinity at both points indicates a grounded brush lead, grounded rotor or a faulty voltage regulator.

RECTIFIER ASSEMBLY TEST

1. Remove rectifier assembly from alternator. To test the positive set of diodes contact 1 ohmmeter test lead to B terminal and contact each of 3 stator lead terminals with other test lead.

2. Reverse the test leads and repeat test. All diodes should show readings

of approximately 6.5 ohms in 1 direction and infinite readings with probes reversed.

3. Repeat test for negative set of diodes by connecting a test lead to rectifier assembly base plate and to other 3 terminals. If meter readings are not as specified replace rectifier assembly.

RADIO SUPPRESSION CAPACITOR TEST

NOTE: This is an open or short-circuit test only and does not measure capacitance value.

1. Contact the ohmmeter test leads to the B terminal and the rectifier base plate assembly. Reverse the test leads while observing the indicator needle.

2. If the needle jumps momentarily and then returns to previous position, capacitor is okay. If needle does not jump replace rectifier assembly. Radio suppression capacitor must be replaced as a complete rectifier assembly.

STATOR COIL GROUND TEST

1. Remove the stator from the alternator.

2. Using an ohmmeter connect a test lead to a stator lead and the other test lead to the stator laminated core. The reading should be infinity.

3. If the meter needle moves then the stator winding is shorted to the core. Replace the stator. Repeat this test for each stator lead.

NOTE: Do not touch the metal test leads or the stator leads, an incorrect test reading will result.

STATOR COIL OPEN TEST

1. Disconnect the stator from the rectifier assembly.

2. Using an ohmmeter, connect a test lead to a stator lead and the other test lead to another stator lead.

3. If the meter does not respond, an open circuit is present and the stator should be replaced. Repeat the test

with the other wire combinations. A single open phase cannot be detected on alternators using a delta connected stator.

ROTOR OPEN OR SHORT CIRCUIT TEST

1. Remove the rotor assembly from the alternator.

2. Using an ohmmeter contact each test lead to a rotor slip-ring. The ohmmeter should read 2.0–3.9 ohms.

3. If the readings are higher than specification it would indicate a damaged slip-ring solder connection or a broken wire.

4. If the readings are lower than specification it would indicate a shorted wire or slip-ring.

5. Replace the rotor if it is damaged. Connect an test lead of the ohmmeter to a rotor slip-ring and the other test lead to the rotor shaft.

6. The ohmmeter reading should be infinity. If this is not the case, the rotor is shorted to the shaft. Replace the rotor if the unit is shorted.

Ford Side Terminal Alternator

The warning lamp control circuit passes current to the warning lamp when the ignition switch is in the **RUN** position and there is no alternator voltage at terminal S. When the voltage at terminal S rises to a preset value, current is cut off to the warning lamp. This circuit is not included in the regulator for vehicles equipped with an ammeter rather than a warning lamp.

A 500 ohm, ¼ watt resistor is connected across the terminals of the lamp at the instrument cluster in vehicles equipped with an indicator warning lamp. The regulator switching circuit receives voltage from the ignition switch through the warning lamp at terminal I on vehicles equipped with

Exploded view of the Ford side terminal alternator

Ford side terminal alternator brush holder assembly

an indicator warning lamp or through terminal S on vehicles equipped with an ammeter. With an input voltage present, the switching circuit turns on the voltage control circuit which, in turn, adjusts field current to control alternator output voltage.

Fuse links are included in the charging system wiring on all models. This fuse link is used to prevent damage to the wiring harness and alternator if the wiring harness should become grounded or if a booster battery is connected to the charging system with the wrong polarity.

ALTERNATOR OVERHAUL

Disassembly

1. Mark both end housings and stator with a scribe mark for assembly.
2. Remove housing through bolts and separate front housing and rotor from rear housing and stator. Slots are provided in front housing to aid in disassembly. Do not separate rear housing from stator at this time.
3. Remove drive pulley nut, lock-washer, pulley, fan and fan spacer from rotor shaft.
4. Pull rotor and shaft from front housing and remove spacer from rotor shaft.
5. Remove the screws retaining bearing to front housing. If bearing is damaged or has lost lubricant, remove bearing from housing. To remove bearing, support housing close to bearing boss and press bearing from housing.
6. Unsolder and disengage 3 stator leads from rectifier. Work quickly to prevent overheating rectifier.
7. Lift stator from rear housing.
8. Unsolder and disengage brush holder lead from rectifier. Work quickly to prevent overheating rectifier.
9. Remove screw attaching capacitor lead to rectifier.
10. Remove the screws attaching rectifier to rear housing.
11. Remove the terminal nuts and

insulator from outside housing. Remove rectifier from housing.

12. Remove the screws attaching brush holder to housing. Remove brushes and holder.

13. Remove any sealing compound from rear housing and brush holder.

14. Remove the screw attaching capacitor to rear housing and remove capacitor.

Inspection

RECTIFIER SHORT GROUNDED AND STATOR GROUNDED TEST

NOTE: These tests are performed with an ohmmeter. Digital meters cannot be used to perform rectifier tests

1. Connect an ohmmeter probe to alternator BAT terminal (red insulator) and other probe to STA terminal (rear blade terminal). Then reverse ohmmeter probes and repeat test. Normally, there will be no needle movement in one direction, indicating rectifier diodes are being checked in reverse current direction and are not shorted. A low reading with probes reversed indicates that rectifier positive diodes are being checked in forward current direction. Using referenced tester, low reading should be about 6 ohms, but may vary if another type of test is used. A reading in both directions indicates a damaged positive diode, a grounded positive diode plate, or a grounded BAT terminal.

2. Perform same test using STA and GND (ground) terminals of alternator. A reading in both directions indicates either a damaged negative diode, a grounded positive diode plate or a grounded BAT terminal.

3. If there is no needle movement with probes in 1 direction and no needle movement or high resistance (significantly over 6 ohms) in opposite direction, a faulty connection exists in stator circuit inside alternator.

FIELD OPEN OR SHORT CIRCUIT TEST

1. Using an ohmmeter, contact the alternator field terminal with 1 probe and ground terminal with other probe. Then, spin alternator pulley. Ohmmeter reading should be between 2.4–100 ohms and should fluctuate while pulley is turning.

2. An infinite reading (no meter movement) indicates a grounded brush lead, worn or stuck brushes or a worn or damaged rotor assembly.

3. An ohmmeter reading less than 2.4 ohms indicates a grounded brush assembly, a grounded field terminal or a worn or damaged rotor.

DIODE TEST

1. Remove the rectifier assembly from the alternator stator. To test a set of diodes, contact one probe to a terminal screw and contact each of 3 stator lead terminals with other probe. Reverse probes and repeat test. All diodes should show a low reading of about 6 ohms in one direction and an infinite reading (no needle movement) with probes reversed. Low reading may vary with type of ohmmeter used.

2. Repeat preceding tests for other set of diodes by contacting the other terminal screw and 3 stator lead terminals.

3. If meter readings are not as specified, replace rectifier assembly.

STATOR COIL CROUNDED TEST

1. Connect ohmmeter probes to a stator lead and to stator laminated core. Ensure that probe makes a good electrical connection with stator core. The meter should show an infinite reading (no meter movement).

2. If meter does not indicate an infinite reading (needle moves), stator winding is shorted to core and must be replaced.

3. Repeat this test for each stator lead. Do not touch the metal probes or stator leads with the hands. Such contact will result in an incorrect reading.

STATOR COIL OPEN TEST

NOTE: A single open phase will not be diagnosed by this test on a 100 amp alternator that has a delta connected stator.

1. Connect ohmmeter probe to a stator phase lead and touch other probe to another stator lead. Check meter reading.

2. Repeat this test with the other 2 stator lead combinations. If no meter movement occurs (infinite resistance) on a lead paired with either of the other phase leads, that phase is open and the stator should be replaced.

ROTOR OPEN OR SHORT CIRCUIT TEST

1. Contact each ohmmeter probe to a rotor slip-ring. The meter reading should be 2.3–2.5 ohms.

2. A higher reading indicates a damaged slip-ring solder connection or a broken wire.

3. A lower reading indicates a shorted wire or slip-ring. Replace rotor if it is damaged and cannot be serviced.

4. Contact an ohmmeter probe to a slip-ring and the other probe to rotor shaft. Meter reading should be infinite (no deflection).

5. A reading other than infinite indicates rotor is shorted to shaft. Inspect slip-ring soldered terminals to assure they are not bent and not

17 CHARGING AND STARTING DOMESTIC

touching rotor shaft, or that excess solder is not grounding rotor coil connections to shaft. Replace the rotor if it is shorted and cannot be serviced.

Assembly

1. If bearing replacement is necessary, support rear housing close to bearing boss and press bearing out of housing.

2. Wipe rotor, stator and bearings with a clean cloth. Do not clean these parts with solvent.

3. Rotate front bearing on drive end of rotor shaft. Check for any scraping noise, looseness or roughness. Look for excessive lubricant leakage. If any of these conditions exist, replace bearing.

4. Inspect rotor shaft rear bearing surface for roughness or sever chatter marks. Replace rotor assembly if shaft is not smooth.

5. Place rear bearing on slip-ring end of rotor shaft and rotate bearing. Make the same check for noise, looseness, or roughness as was made for front bearing. Inspect rollers and cage for damage. Replace bearing if these conditions exist, or if lubricant is lost or contaminated.

6. Check pulley and fan for excessive looseness on rotor shaft. Replace any pulley that is loose or bent out of shape.

7. Check both front and rear housing for cracks, particularly in webbed areas and at mounting ear. Replace damaged or cracked housing.

8. Check all wire leads on both stator and rotor assemblies for loose or broken soldered connections and for burned insulation. Resolder poor connections. Replace parts that show signs of burned insulation.

9. Check slip-rings for nicks and surface roughness. Nicks and scratches may be removed by turning down slip-rings. Do not go beyond minimum diameter of 1.220 in. If rings are badly damaged, replace rotor assembly.

10. Replace brushes if they are worn shorter than $\frac{1}{4}$ in.

12. If front housing bearing is being replaced, press new bearing in housing. Apply pressure on bearing outer race only. Install bearing retaining screws and tighten to 25-40 inch lbs.

13. Place inner spacer on rotor shaft and insert rotor shaft into front housing and bearing.

14. Install fan spacer, fan, pulley, lockwasher and nut on rotor shaft. Use the proper tool to tighten pulley nut.

15. If rear bearing is being replaced, press a new bearing in from inside housing until rear bearing face is flush with boss outer surface.

16. Position brush terminal on brush holder. Install springs and brushes in brush holder and insert a piece of stiff wire to hold brushes in place.

17. Brushes and springs are serviced as part of brush holder assembly. Position brush holder in rear housing and install attaching screws. Brush retaining wire must stick out enough to be grabbed and pulled from housing assembly.

18. Waterproof glue sealer may have to be pushed out of pin hole in housing. Push brush holder toward brush holder attaching screws. Reseal crack between brush holder and brush cavity in rear housing with caulking cord or equivalent body sealer. Do not use silicone base sealer for this application.

19. Position capacitor to rear housing and install attaching screw. Place 2 rectifier insulators on bosses inside housing.

20. Place insulator on BAT (large) terminal of rectifier and position rectifier in rear housing. Place outside insulator on BAT terminal and install nuts on BAT and Grd terminals fingertight. Install, but do not tighten, the rectifier attaching screws.

21. Tighten the BAT terminal nuts to 35-50 inch lbs. and GRD terminal nuts to 25-35 inch lbs. on outside of rear housing. Then, tighten rectifier attaching screws to 40-50 inch lbs.

22. Position capacitor lead to rectifier and install attaching screw.

23. Press brush holder lead on rectifier pin and solder securely. Work quickly to prevent overheating of rectifier.

24. Position stator in rear housing and align scribe marks. Press 3 stator leads on rectifier pins and solder securely using resin core electrical solder. Work quickly to prevent overheating rectifier.

25. Position rotor and front housing into stator and rear housing. Align scribe marks and install through bolts.

Tighten 2 opposing bolts and the remaining bolts.

26. Spin fan and pulley to be sure nothing is binding within alternator.

27. Remove brush retracting wire and place a daub of waterproof cement over hole to seal it. Do not use silicone sealer on hole.

JEEP

Delcotron SI-Series

The charging system is an integrated AC generating system containing a built in voltage regulator. The regulator is mounted inside the slip ring end frame. All regulator components are enclosed in an epoxy molding and the regulator cannot be adjusted.

ALTERNATOR OVERHAUL

Disassembly

1. Remove the alternator from the vehicle. Position the assembly in a suitable holding fixture.

2. Make scribe marks on the alternator case end frames to aid in reassembly.

3. Remove the assembly through bolts and separate the drive end frame assembly from the rectifier end frame assembly.

4. Remove the rectifier nuts and the regulator screws from the end frame assembly.

5. Separate the stator, diode trio and voltage regulator from the end frame assembly.

6. Check the stator for opens using an ohmmeter. If high readings are obtained, replace the stator.

7. Check the stator for grounds, using an ohmmeter. If readings are low, replace the stator.

8. Using an ohmmeter, check the rotor for grounds. The ohmmeter reading should be very high. If not, replace the rotor.

9. Using an ohmmeter, check the rotor for opens. If the ohmmeter reading is not 2.4-3.5 ohms, replace the rotor.

10. To check the diode trio connect the ohmmeter to the diode trio and then reverse the lead connections. The ohmmeter should read high and low. If not, replace the diode trio. Repeat the same test between the single connector and each of the other connectors.

11. Check rectifier bridge with ohmmeter connected from grounded heat sink to flat metal on terminal. Reverse leads. If both readings are equal then replace rectifier bridge.

12. Repeat test between grounded heat sink and other 2 flat metal clips.

13. Repeat test between insulated heat sink and 3 flat metal clips.

14. Clean or replace the alternator brushes as required. Position the brushes in the brush holder and retain them in place using the brush retainer wire or equivalent.

15. To remove the rotor and drive end bearing, remove the shaft nut, washer and pulley, fan and collar. Push the rotor from the housing.

16. Remove the retainer plate from inside the drive end frame. Push the bearing out. Clean or replace parts as required.

Inspection

INDICATOR LAMP OPERATION TEST

1. Check the indicator lamp for normal operation. If the indicator lamp operates properly, refer to the under-

charged battery test. If the indicator lamp does not operate properly, proceed with the following tests.

2. Switch **OFF**, lamp **ON**. Unplug the connector from the generator No. 1 and No. 2 terminals. If the lamp stays **ON**, there is a short between

these 2 leads. If the lamp goes out, replace the rectifier bridge.

3. Switch **ON**, lamp **OFF**, engine stopped. This condition can be caused

17 CHARGING AND STARTING DOMESTIC

Grounding the field winding by inserting a tool into the test hole to a depth of 1 in. — Delcotron alternator — Jeep

Delcotron alternator diagnostic tester (J-26290) use tester according to manufacturers instructions

by the defects listed above or by an open in the circuit. To determine where an open exists, proceed as follows. Check for a blown fuse or fusible link, a burned out bulb, defective bulb socket or an open in No. 1 lead circuit between generator and ignition switch. If no defects have been found, proceed to undercharged battery test.

4. Switch **ON**, lamp **ON**, engine running. Check for a blown fuse, (where used), between indicator lamp, ignition switch and also in A/C circuit.

UNDERCHARGED BATTERY TEST

1. Be sure the undercharged battery condition has not been caused by accessories that have been left **ON** for an extended period of time.

2. Check the alternator belt for proper belt tension. Inspect the battery for physical defects. Replace as required.

3. Inspect the wiring for defects. Check all connections for proper contact and cleanliness, including the slip connectors at the generator and bulk-head connections.
